JOHN SHAW & SONS (Salford).—This company has been registered, with a capital of £50,000 in £1 shares, to adopt an agreement with Joseph Shaw, of Wellington Street Works, and to take over the business of steam, hydraulic, chemical, and electrical engineers previously carried on as J. Shaw, Sons & Co. No initial public issue. Registered offices, Wellington Street Works, Salford, Lancs.

MIDLAND ELECTRIC LAUNDRIES.—This company was registered on September 16th, with a capital of £3,000 in £1 shares (500 preference), to take over the laundry business carried on at 117 Sherbourne Road, Birmingham, by F. Allbutt. Private company. The number of directors is not to be less than two, nor more than five; the first are F. Allbutt and A. O. G. M. Grove. Qualification, £50. Remuneration, £20 per annum, dividend. Registered office, 117 Sherbourne Road, Birmingham.

RADIO AND ELECTRIC POWER CO.—This company was registered on September 16th, with a capital of £10,000 in £1 shares, to carry on the business of electricians, workers of radio-telegraphy, engineers, suppliers of electricity, manufacturers of and dealers in apparatus for automatic telegraphy and telephony, &c. The subscribers are:—Lieut. J. H. Hills, R.N.R., 51 Burton Court, Lower Sloane Street, S.W.; A. C. Grover, F.S.A.A., St Davids, 53 Mount Nod Road, Streatham, S.W., accountant; G. L. Bullock, 86 Forburg Road, Clapton Common, N., electrician; A. Simkins, Parel, Holden Road, Woodside Park, N., electrical engineer; A. Gray, 42 Clovelly Road, Ealing, W., engineer; E. H. Neville, 55 Gresham Road, Brixton, S.W., clerk; P. F. Haynes, Belmont, York Road, Southend-on-Sea clerk. Private company. Table "A" mainly applies. Registered office: 102 Fenchurch Street, E.C.

RAILWAY & TRAMWAY DEVELOPMENT CO.—This company was registered on September 16th, with a capital of £50,000 in £1 shares, to acquire any decrees, concessions, contracts, privileges, rights, guarantees, and benefits for the construction, leasing, working, or dealing with railways, tramways, light railways, or other public works, to construct, establish, maintain, and work any roads, electric lines, electric power and supply, mining, land improvement, and other operations, &c. Minimum cash subscription, seven shares. The number of directors is not to be less than two, nor more than seven; the first are Rt. Hon. Lord Teynham, Ravensdale House, Ascot, and A. Docker, 9 Grays Inn Square, W.C. Qualification, £100. Remuneration, £100 each per annum (chairman, £150), and 10 per cent. of the net profits after 10 per cent. is paid, dividend (maximum additional remuneration, £1,000). Registered office, 5 London Wall Buildings, E.C.

STATE OF BAHIA SOUTH-WESTERN RAILWAY.—This company has been registered, with a capital of £200,000 in £1 shares, to adopt an agreement with B. B. de Oliviera and Messrs. Fry, Meyers & Co., to carry on the business of constructors and workers of railways, tramways, telegraph and telephone lines, &c., in Bahia or elsewhere in Brazil, to generate, accumulate, supply, and use electricity for light, heat, power, or other purposes, &c. Minimum cash subscription, 10 per cent. of the shares offered to the public. First directors (not less than three nor more than seven) to be appointed by signatories. £250. £175 each per annum (£75 extra for the chairman) and 10 per cent. of the distributed profits, divisible. (99,497).

COMPANY MORTGAGES

AMALGAMATED RADIO-TELEGRAPH CO.—Particulars of charges, dated 1907 and 1908, securing £22,474.

W. H. ALLEN, SONS & CO.—Particulars have been registered of a trust deed dated July 22nd, 1900, securing £28,000.

CALMONT KING & CO., LTD.—Particulars have been filed of £2,000 debentures, created by resolution of August 7th, 1908, pursuant to section 10 (3) of the Companies Act, 1907, the amount of the present issue being £500. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

DURHAM COLLIERIES ELECTRIC POWER CO.—Particulars have been filed of an agreement dated August 15th, 1908, to secure £21 annual remuneration to trustees (supplemental to agreement of July 15th, securing £2,500 and interest). Property charged, the general assets of the company.

EDMUNDSON'S ELECTRICITY CORPORATION.—Trust deed September 3rd, for securing £100,000 five per cent. prior lien debenture stock, and trust deed September 3rd supplemental to trust deeds dated July 10th, 1899, and December 19th, 1905, and seven indentures dated from April 27th, 1900, to January 19th, 1906, for securing an addition to the rate of interest of ½ per cent. per annum, and, in certain events, a premium of 5 per cent., in respect of £472,000, the amount now outstanding of an issue of £480,000 first mortgage debenture stock; trustees: Electric & General Investment Co., Ltd., and Sir J. Bailey & The Anglo-American Debenture Corporation, Ltd. (£76,900 first mortgage debentures, and £5,800 first mortgages debenture stock of various subsidiary undertakings and debentures of certain electric light, power, and supply companies, undertakings, and other assets and property, present and future).

GLOUCESTER RAILWAY CARRIAGE AND WAGON CO.—Issue on August 12th of £850 Debentures, part of a series of which particulars have already been filed.

LISBON ELECTRIC TRAMWAYS.—A statement has been filed showing the total amount outstanding on July 1st, in respect of mortgages and charges created prior to that date, and not required to be registered under Section 14 of the Companies Act of 1900. This gives particulars of a mortgage dated November 22nd, 1890, securing £345,000.

"X" SYNDICATE, LTD.—Particulars of £3,700 Debentures created by resolution of July 23rd, 1908, have been filed pursuant to Section 10 (3) of the Companies Act, 1907, the whole amount being issued on same date. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

PUBLISHERS' ANNOUNCEMENT

The price of "Electrical Engineering" has been reduced to 1d.

The first number of "Electrical Engineering" was published on January 3rd, 1907, and the paper immediately took the leading position among the electrical newspapers. A thoroughly sound and practical technical paper, written and edited by men with long experience on the practical side of the electrical engineering industry, and illustrated with useful drawings to scale and well-printed photographs, was welcomed, and in spite of the comparatively high price of 6d., which it was necessary to charge for it, the paper scored an immediate success. The proprietors have been repeatedly urged to reduce the price in order to bring the paper within the reach of a wider circle of readers, and they are now in a position to make a concession in this direction that was not possible hitherto. They do not believe in half measures. From to-day onward, therefore, "Electrical Engineering" will be on sale throughout the United Kingdom at the popular price of 1d. weekly (post free 1½d.), and it will therefore appeal to everyone connected with the electrical engineering industry. The leading features of the Paper will remain unaltered. No change has been made in the Editorial Staff, the same high-class printing and illustrations will be maintained, and the proprietors rely absolutely on the enormous increase of circulation which is assured, to recompense them for the sacrifice they are making in decreasing the price.

We feel confident that our readers will assist us by bringing the paper to the notice of engineers engaged in kindred branches of the engineering industry. It will be unnecessary, moreover, that

Digitized by Google

single copies of "Electrical Engineering" should circulate among 20 or 30 readers, as frequently happens at present; in future each reader will be able to buy and retain his own copy at 1d.

Arrangements have been made by which "Electrical Engineering" will be obtainable at all Messrs. W. H. Smith & Sons' and Messrs. Wyman's bookstalls, and through every newsagent in the United Kingdom. If any difficulty is experienced in obtaining it, complaint should at once be made to the Publishers. Readers who prefer to receive the paper through the post should order it direct from the Publishers (The Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, London, E.C.). The annual subscription rate, including postage, is 6s. 6d. for the United Kingdom, 8s. 8d. for Canada, and 13s. for other Colonies and abroad. (Subscriptions should be paid in advance.)

Existing subscribers will have the unexpired period of their subscriptions extended in proportion to the difference in price.

We regret to say that Messrs. Cassell and Co. Ltd., are issuing in sevenpenny fortnightly parts a publication entitled "Electrical Engineering," in spite of our protests that confusion is likely to arise in the newspaper trade owing to the title being the same as ours. There is no possibility of any of our present readers being misled, but to avoid mistakes by their newsagents, they are recommended to make it clear when ordering their copies that they require "Electrical Engineering," the weekly newspaper.

SUMMARY

We publish this week a supplement devoted to the Manchester Exhibition. It contains an article on the advantage of such exhibitions to the industry; a historical review of past electrical exhibitions and of all the steps taken in the promotion of the present one; photographs of the Consulting Electrical Engineers and of the Manager and Secretary; a preliminary notice of some of the exhibits; a map of Manchester showing the position of the Exhibition; a numbered plan of the building to assist in the finding of the various exhibits; and other information. The Incorporated Municipal Electrical Association will pay an official visit to the Exhibition on October 17 and 18, and visits will also be made by the Electrical Contractors' Association and the Rugby Engineering Society.

The sub-station at the Manchester Electrical Exhibition is described in detail. It has been erected by the Manchester Corporation, and plant is employed which will subsequently be transferred to their permanent sub-stations. Large machines have been put in, as the exhibition load is heavy. A Westinghouse rotary converter with a specially arranged booster on the same shaft, in order to give a very large range of voltage regulation, is one of the three machines put in. The detailed arrangements of the wiring of the exhibition are also described in the article. (Page 485.)

The following books are reviewed in this issue:—"Electrical Engineers' Pocket Book," by H. A. Foster; "Electric Lighting and Power Distribution," by W. Perren Maycock. (Page 488.)

One of the latest of the manufacturing firms to move out of London is Messrs. Arc Lamps, Ltd. A new works of modern design has been built especially for the firm at St. Albans. The chief work in hand at present is the manufacture of a new pattern of open-flame arc with converging carbons and gravity feed. A spring is substituted for the usual shunt coil, and by suitably shaping the series plunger an even and sensitive control is effected. To ensure that the arc is deflected downwards in a vertical position, a few series turns are wound on one limb of the iron frame above the economiser. (Page 489.)

The equipment of the power station for the London Post Office telegraph and telephone system near Blackfriars Bridge is to be proceeded with and a contract has been let for turbo-alternators, &c. The building has been complete for some time. (Page 490.)

A serious collision occurred on Saturday on the Berlin elevated electric railway, whereby a number of lives were lost. (Page 490.)

Under Electrometallurgy and Electrochemistry is an account of some experiments on the reduction of refractory oxides by carbon and some notes on the effects of temperature on the capacity of lead accumulators. (Page 490.)

At the annual meeting of the Municipal Tramways Association a paper was read by Messrs. R. G. and J. G. Cunliffe, Assistant Electrical Engineers to the Manchester Corporation, in which certain methods of economising in current consumption were suggested. Among the proposals is that the usual gauge of the trolley wire should be very much increased, and that the wire should be frequently renewed, as the authors think that the wear on the trolley wire increases the C^2R losses sufficiently to make this worth while. They also propose a modified arrangement of trolley wires, consisting of two bronze wires, one for each track, with a copper wire between. Other suggestions were for copper-faced fish-plates, a modification in the controller connections and an alteration in the design of cars. Mr. A. L. C. Fell (Chief Officer of the L.C.C. Tramways) has been elected President of the Association for the coming year. (Page 491.)

A description is given of a simple form of prepayment meter for use on small installations where charging is reckoned on the hours during which current is used irrespective of the number of lamps in use. (Page 495.)

Short articles describe an ingenious new lampholder in which the leads are attached without the use of screws, an electrical floor polisher, and an effective poster relating to tantalum lamps. (Page 496.)

In relation to the fire at the Paris Telephone Exchange last week, we now give some particulars as to the exchange equipment, and the very large use of paraffin cotton cable. Some remarks are also made as to the time that may be taken to restore the service. (Page 497.)

It is stated that the Board of Trade only requires to be satisfied on one matter before assenting to the transfer of the Bath Corporation Electricity Works to a company.—The consideration of an application by the London Electrobus Co. for a license to run six 'buses in Brighton has been deferred for three months.—Mr. Arthur Ellis, the Tramways Manager at Cardiff, and the City Engineer have been instructed to prepare a report upon the condition of the tramway track.—The Ipswich Corporation has leased a site to the Admiralty for a wireless telegraph station. A supply of electrical energy will be taken from the Corporation estimated to amount to £300 per annum.—A new telephone exchange has been completed at Kingston-on-Thames. (Pages 497 to 499.)

Electric lighting schemes are under consideration for Banbridge, Crayford, Fentona, and Castleblayney.

Digitized by Google

A Local Government Board enquiry has been held at Elland (£3,000). The Limerick Corporation require two switchboard panels, and the Warrington Corporation flame arc lamps. (Pages 499 to 500.)

The report of Messrs. Willans & Robinson for the half-year to June 30th shows a profit of £18,472 after writing off £6,510 depreciation. After deducting a loss upon the Queensferry works there is a net profit of £15,685, in addition to £7,443 brought forward. A 10 per cent. dividend is announced upon the ordinary shares. At the meeting of Messrs. Dick, Kerr & Co., on Tuesday, it was stated that owing to the depression in the electrical industry at home, the Company has turned its attention to foreign and colonial trade with gratifying results. Mr. Arnold Lupton, at the annual meeting of the Yorkshire Electric Power Co., on Tuesday, referring to the cotton strike, said that textile factories accounted for 40 per cent. of their revenue. (Pages 501 to 502.)

Among the patent specifications published by the Patent Office on Thursday last is one by Dr. C. C. Garrard and Ferranti, Ltd., for an improved time limit relay for overload circuit-breakers. It is of the suspended weight class and provides for very easy adjustment. A specification by the British Thomson-Houston Co. and others relates to reverse-current circuit-breakers of the differential type for alternating-current systems. Special windings are provided for the purpose of neutralising the transformer action which takes place between the two main windings. The British Thomson-Houston Co. have another specification in which is described a process of manufacturing high resistance metal filaments from a mixture of tungsten and thorium oxide in various proportions; a paste for connecting such filaments to the leading-in wires is also included. For preventing the communication of disease through the medium of telephone mouth-pieces it is proposed in a specification by J. Freel to cover these with antiseptically treated silk. (Page 503.)

A paper was read yesterday by Mr. C. H. Merz at the Middlesbrough meeting of the Iron and Steel Institute on "Power Supply and its Effect on the North-east Coast Industries." The author gave some particulars of the growth of the undertaking of the Newcastle-upon-Tyne Electric Supply Co., which now works in connection with the Durham Electrical Power Distribution Co. and the Cleveland and Durham Electric Power Co., part of the plant of which has been altered to be of the same frequency. The whole scheme now combines eight generating stations aggregating 136,550 h.p. (including three waste heat stations), and three representing an additional 34,000 h.p. are under construction. The paper considered the questions of utilising the waste heat from coke ovens and blast furnaces, &c., and pointed out the advantages of co-operation with a power company in this direction. (Page 505.)

A paper was read at the Middlesbrough meeting of the Iron and Steel Institute by Mr. S. Cowper-Coles describing a process for the electrolytic production of finished iron sheets and tubes in one or two operations from crude or scrap iron or direct from the ore without smelting, rolling or drawing. (Page 507.)

The annual report of the Postmaster-General for the year to March 31, 1908, states that underground telegraph lines are under construction from Birmingham (southwards) and from Bristol (northwards), whilst progress is also being made with the line between Newcastle and Leeds. A committee of the London Chamber of Commerce has made an investigation into the method of metering calls and is satisfied that the percentage of error, which is very small, is in favour of subscribers. New subscribers are being connected to the London Post Office telephone system at the rate of about 160 per week. (Page 508.)

The report of the deputation appointed by the Manchester Corporation Tramways Committee to consider the merits of the trackless trolley system for developing traffic in outlying districts where the frequency of the service is not sufficient to warrant the laying of tramlines, puts the economic limit for tramways at about a fifteen-minute service. Where the traffic is less than this the trackless trolley system appears to offer great advantages over the self-contained motor omnibus. Some pioneer trackless lines in Germany are described, but a proposed form of vehicle more suited to English conditions is described. (Page 509.)

The introduction of petrol-electric motor coaches on the Arad-Csarras Railways in Hungary for the light traffic has resulted in a great financial improvement. Two sizes of car with 40 and 80 h.p. equipments are used, either alone or in combination with one or two trailers. (Page 510.)

In our Tenders columns will be found, under the heading Coventry, a short reference to the prevailing complaint that the cable "ring" in this country, *i.e.*, the Cable Makers' Association, are keeping up the prices of electric light and power cable to a figure far higher than that for which equally good cable can be obtained from abroad. This is not an isolated case of complaint, and the dissatisfaction seems to be general. That a group of manufacturers should combine to prevent the price of cable being reduced to a ruinous limit is but natural in the present state of the industry; but it would appear that the cable makers are rather overdoing things, with the result that several orders have been going abroad which should certainly not be lost to this country. We cannot think that the cable manufacturers here are so overwhelmed with orders at the present time that they actually wish to divert them to foreign manufacturers. A statement on this subject from the leading cable makers or from their Association would be welcome. A solution of the present difficulty would be certainly to their own interests, for on some sides it has even been suggested that the cable makers have brought matters to such a pitch that combined action on the part of cable users might be advisable in order to ensure that tenders for British-made cable should be really competitive. In the meantime the cable-makers outside the ring are reaping a harvest, which we certainly do not grudge them.

We publish in this week's issue the results of the investigation of the merits of the "trackless trolley" system made by a deputation appointed by the Manchester Corporation Tramways Committee, and on the whole it may be said that their conclusions are identical with those of the Dundee sub-committee who considered the same question some months ago. (See Electrical Engineering, July 30, page 184.) Both these reports clearly recognise the value of the steerable vehicle running on ordinary roads and taking power from an overhead line as feeders to tramway systems in suburban districts, where the traffic is not sufficient to warrant the laying of rails. As we have already had occasion to point out, it is useless to pretend that the trolley omnibus is a competitor with tramways for heavy traffic, but for use as feeders and for developing traffic their advantages over petrol or steam driven omnibuses appear very real. It is possible, too, that the system may prove of use in narrow streets unsuitable for tramways or for maintaining temporary service

Digitized by Google

in case of breakdowns, blocks or track repairs. Granted, then, that from economic and traffic points of view there is a distinct, though perhaps limited, field for the trolley omnibus, it is of interest to look at the engineering side of the question. In the pioneering days of any form of traction difficulties occur which only experience can surmount and early forms are often discarded. The cumbersome looking front driven, iron-tyred machines on the lines in Germany appear to be a survival of designs evolved before "automobile engineers" existed, and we are pleased to see a design put forward which evidently is based upon the work of both the experienced builder of heavy mechanical vehicles and the electric tramway engineer. The seating capacity is considered by the Manchester committee to be somewhat small for the purpose they have in view, but it must be remembered that one of the chief lessons of modern traffic results has been that a frequent service of small vehicles develops traffic more rapidly than a larger vehicle running less often.

THE accident on Saturday on the Berlin electric elevated railway, better known by its German name, the *Hochbahn*, is one of the most serious of its class which has occurred. Its tragedy is all the more intensified by the fact that appliances exist, and are widely used on other railways handling similar traffic, whose direct object is the prevention of this form of disaster. More will doubtless be known of the circumstances which led the unfortunate driver to disregard the signals, but the occurrence emphasises the need for recognising possible mental as well as mechanical failures, as is done by the provision of the "automatic train stop" on the Underground Electric Railways of London, an appliance which, by tripping an air valve, applies the brake at once independently of the driver if a train passes a signal at danger.

THAT electric tramways have not come up to early anticipations as profit-earning concerns is a general complaint with the management of both municipally and company-owned undertakings. In most cases the complaint is that the cost of repairs and maintenance is excessive. The paper read by the Messrs. Cunliffe at the Nottingham meeting of the Municipal Tramways Association last week, suggesting that alterations in equipment and methods of working in certain directions will reduce working costs, will therefore be read with critical interest in tramway circles. The first point dealt with is the most economical size of trolley wire, which they put at a larger figure than is usually taken. It has been frequently stated, on the other hand, that the smallest sizes in use are generally the most economical, but the service on the line must be taken into account. Messrs. Cunliffe have probably disregarded the cost of the supporting structure, but this cannot be ignored in designing for minimum annual cost, including capital charges. Trolley wire, being a wearing part, should be chosen to give the most economical life, reckoning in the cost of renewal the difference between the value of the new wire, and the scrap copper recovered. To use a heavier trolley wire than is needed for mechanical reasons in order to reduce electrical losses is a mistake; it is better to use the additional copper as a feeder, either underground or overhead, as Messrs. Cunliffe suggest, when it will not have to bear the scrapping loss every few years. Their proposal to employ a better wearing material, such as silicium bronze, as the actual trolley wire, would be excellent, if the bronze really is better; but trolley wire does not fail, as a rule, from wear in the sense of attrition, but from severely localised stresses, and arcing, which will not be necessarily avoided by the use of a different metal. That the usual methods and materials of trolley insulation leave room for improvement is generally agreed, and Messrs. Cunliffe's desire to eliminate the insulated bolt will meet with much sympathy. The curious annual increase in power consumption per car mile on many tramways has excited a good deal of attention, and the author's endeavours to localise the causes should assist managers to put a stop to this feature. Generally speaking, it is due to a falling off of efficiency in many parts of the equipment, but mainly in the running and electrical gear on the cars. As a good deal of the wasted power is spent destructively, there is a double object in stopping the wastages. The suggestion to reduce the maximum demand by increasing the acceleration of cars on the series notches suggests poor driving, or unsuitable equipment of the cars considered. Both are common faults. The division of the rheostat between the notches is often unsuitable, and capable of improvement, but nothing will make up for unskilful driving, because the starting current needed to give a certain acceleration varies with gradients and loads. In practice it is the acceleration that varies, and the driver's skill is shown in recognising when the car has attained the speed corresponding to each notch, a speed that varies with both load and gradient, and one of Messrs. Cunliffe's proposals certainly seems to us of questionable expediency, but they will excite thought and discussion and will so do good.

Tramway Standards.—In his recent circular to local authorities upon motor-cars and highways, Mr. John Burns stated that the Board of Trade has written to him saying that it will not sanction any more central standards for tramway purposes, and he makes a suggestion to the Local Government Board that it should not approve loans for electric lighting in cases where it is proposed to instal lamps in the centre of roads.

Association of Engineers-in-Charge.—Mr. James Swinburne, F.R.S., has accepted the Presidency of this Association for the ensuing session, and will deliver his Presidential Address on "Smoke" on Wednesday, October 14th, at 8 p.m. at the St. Bride's Foundation Institute, Bride Lane, Fleet Street, London, when Mr. W. H. Patchell will be in the chair. On Saturday, October 3rd, the Association will pay a visit at 2.45 p.m. to the National Physical Laboratory. The train leaves Waterloo at 1.40 p.m.

Australian Trade and Shipping Conditions.—At a meeting of the Committee of the Manufacturers' Association of Great Britain held at Queen Anne's Chambers yesterday, some matters of considerable importance were dealt with concerning Australian trade. Mr. Ben. H. Morgan, who recently visited Australia, New Zealand, and Canada on a special mission of trade investigation on behalf of the Association, delivered an interesting statement on the results of his mission. In investigating the cause of the growth of foreign trade in these markets, he said he discovered that the operations of the shipping ring or conference, controlling all steamer freight from Great Britain, was to a substantial extent responsible for the diversion of British trade. He found numerous cases where this ring was carrying German and American goods at much lower rates than British goods. The difference in some cases being as wide as £2 per ton. Mr. Morgan reported that he had also arranged with the Australian Government for the establishment in London of a showroom where samples and patterns of goods will be kept, for which tenders will be invited from time to time from British firms. This will enable British firms to see exactly what they are tendering for, and so enable them to give closer prices.

THE SUB-STATION AT THE MANCHESTER EXHIBITION

AN extremely large amount of electrical energy is required for the lighting and power at the Manchester Exhibition, and to provide for this a sub-station has been erected by the Manchester Corporation in approximately the centre of the building. The load will be heavy and continuous, for the building has purposely been erected without windows, so that it may be electrically lighted all day long, and the amount of light and power employed on the exhibitors' stands is naturally no small amount. By the courtesy of Mr. S. L. Pearce, who went through the details of the sub-station with us, we are able to describe its main points of interest and new features instead of giving a mere catalogue of the plant. The sub-station is open to the full view of the public, as it has not been enclosed in any way, and it thus forms one of the most interesting items in an exhibition at which very little can be considered uninteresting.

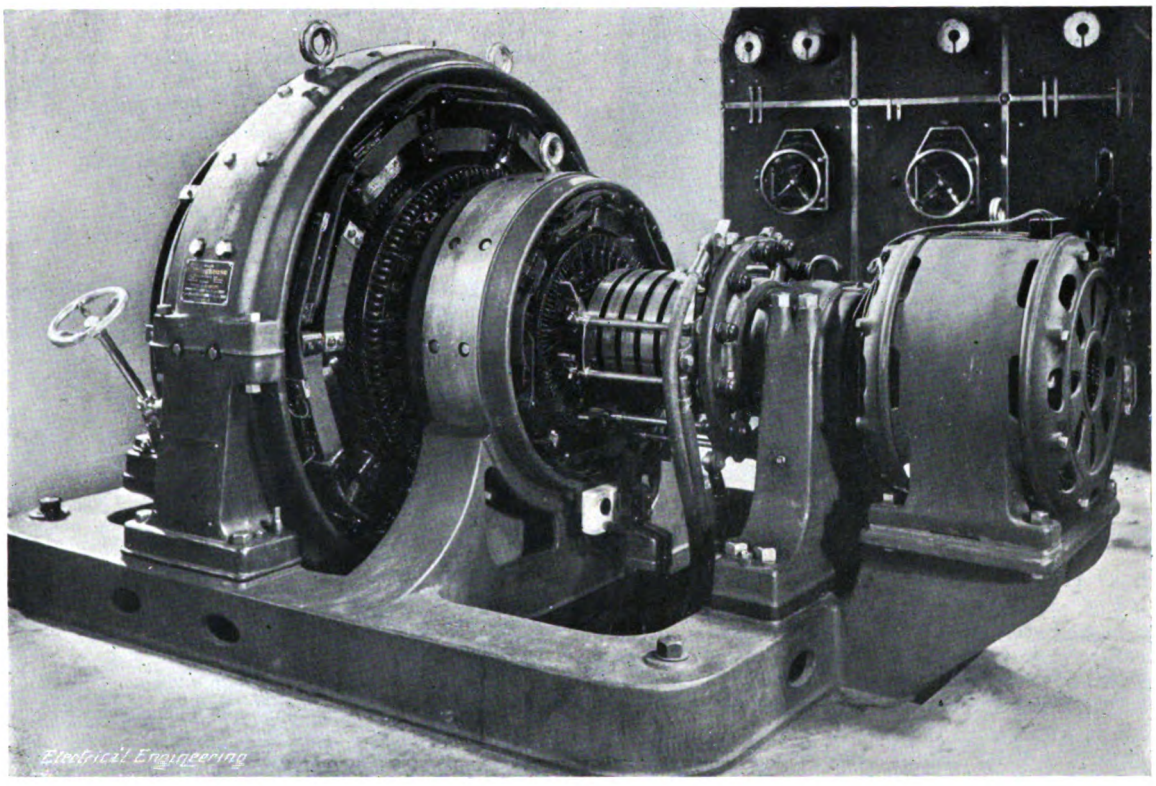

Fig. 1.—Westinghouse Rotary Converter with Special Booster and Starting Motor. An E.H.T. Feeder Panel is seen behind.

The maximum demand expected is 1,150 kw. of continuous current and 250 kw. alternating, and, as will be seen, ample margin has been left. The plant selected has been throughout of a type suitable for the Corporation's permanent sub-stations, and the Corporation have agreed to take it over from the makers within eighteen months of the close of the exhibition. It must have been a difficult task to arrange the lay-out of the plant in the limited space available, but this has been effected without undue cramping, as will be seen by the plan (Fig. 4).

Two 0·15 sq. in. mains from the Corporation's Stuart Street generating station have been diverted for the purpose of the exhibition supply, and they carry 6,500-volt three-phase current to the high-tension switchboard. This is a Ferranti board of the very latest design. It consists of vertical columns of reinforced concrete cubicles, in which various parts of the high-tension gear are effectively isolated from each other. The compartments are closed in front by $\frac{1}{8}$ in. planished steel sheets, and at the back by iron doors, and the switches are operated by handles projecting through the steel sheets in front of the switchboard. The potential transformers for the measuring instruments are enclosed at the left-hand end of the board, and the current transformers are at the top. On the feeder panels, in addition to the usual tripping device, is a "no-voltage" release. In the event of a fault occurring which brings down the supply pressure to such an extent that the converting machinery gets out of step, this release switches the sub-station off. All the switches are of the oil-break pattern.

Three converter sets are employed. Of these the most interesting is a new design supplied by the Westinghouse Co. This is a 700 kw. rotary converter supplied through an 800 kw. three-phase static transformer. The new point about the machine is the arrangement of an A.C. booster on the same shaft, in addition to which there is an induction motor which acts as starter. The booster is connected below the collector ends and the armature, and the voltage is varied by changing the excitation of this booster. The power factor can be varied independently of the voltage by adjusting the excitation of the main field magnet. Thus it is possible to run all day at a leading power factor and so compensate for lagging current taken by other apparatus. The rotary, which is of the six-phase type, is fitted with heavy amortisseurs. Without the booster it will give a range from 440 to 480 and from 500 to 575 volts, and with the booster from 400 to 550 volts. From an efficiency curve which the Westinghouse Co. have sent us, it appears that the combined efficiency of the rotary and transformer is 95¼ per cent. full load; 93½ per cent. half load; and 89 per cent. quarter load. The addition of the booster reduces the efficiency only by two-thirds of 1 per cent. at full load. The starting

Digitized by Google

motor is of the squirrel cage type and is switched straight on to the 400-volt A.C. 'bus bars of the L.T. switchboard, which are supplied by the three transformers referred to below. It may be noted also that the cables from the L.T. side of the static transformers go straight to the slip rings of the motor

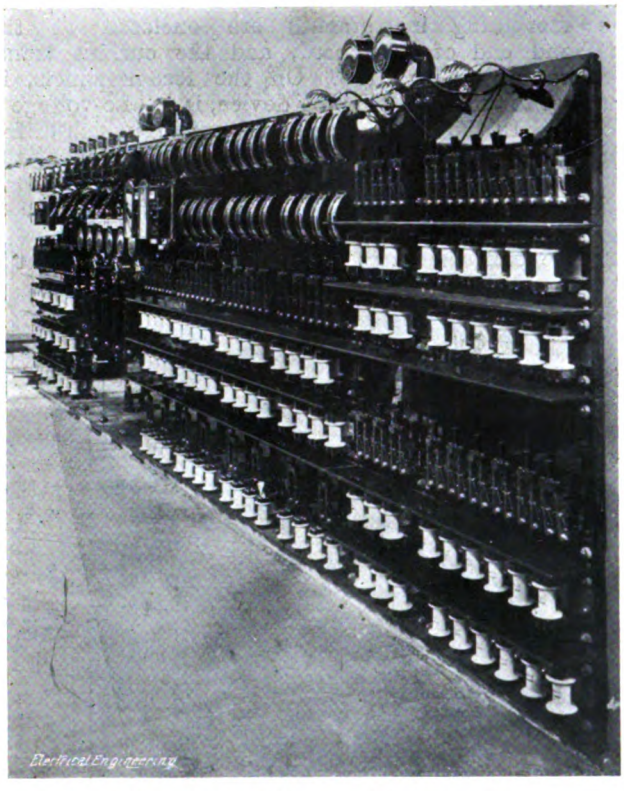

Fig. 2.—Low-Tension Switchboard.

generator, so that the switching is kept as simple as possible. Fig. 1 is from a photograph of this set which we have had taken at the exhibition.

The second set is a 500 kw. induction motor generator of the two-bearing type made by the General Electric Co., Ltd. Its design is generally on standard lines, but it is fitted with ball bearings. The third set is a 600 kw. La Cour motor converter, supplied by Messrs. Bruce Peebles & Co., Ltd. This machine is destined for the Polygon sub-station after the exhibition closes, and the General Electric motor generator will be transferred to the Sherborne Street sub-station. All three machines are three-wire machines and capable of supplying a considerable out-of-balance current to the 2 × 200-volt D.C. circuits. No balancing transformer is employed, and no battery.

For the A.C. supply, three 250 k.v.a. transformers have been put in, giving 400 volts on the secondary side on each phase. These are mesh connected on the secondary side, and in order to give a 230-volt lighting supply three inter-connected star balancing coils are provided. We may add that these transformers will be transferred to the Stuart Street station after the close of the exhibition, and will be employed for the auxiliary plant there.

The low-tension board, which has been supplied by Messrs. Ferranti, Ltd., is a well-designed board, presenting, however, no unusual features. As is seen by the illustration (Fig. 2), the arrangement and disposition of the switches and fuses has been well thought out, and the board is of the flat-back panel pattern. The arc lighting circuits for the general lighting of the building are on the right hand and the circuits to the exhibitors on the left. At the bottom is an emergency panel which enables the arc lighting circuits to be switched over, in the event of a breakdown, on to a small gas-driven set on Messrs. Crossley Bros.' stand. From the sub-station, twelve three-wire D.C. feeder circuits, each of 0·25 sq. in., 0·125 sq. in., 0·25 sq. in. section, are run underground before rising up to the distributing fuse boards (Fig. 3). These latter are of the ironclad and totally enclosed type, made by Messrs. Reyrolle & Co., and are mounted high up on the uprights of the building supporting the roof principals. Two D.P. boards are provided at each feeding point, the middle wire being split between the two. Twenty-four D.P. boards have been required in all therefore. Twelve ways are provided on each board, and each is capable of carrying 30/40 amperes. Each set of contacts and fuses is mounted on a separate slate base. The main feeders are coupled direct to the 'bus bars from the underside, and the branch feeders from both poles are led out at the top. The fittings are mounted on two different planes, in order to allow the cable connections for the bottom row to clear the top row.

In a somewhat similar manner, the A.C. feeder circuits, of 0·075 sq. in. section, and comprising four single conductors, are run to four points in the building, where the three-phase distribution fuse boards are fixed. These boards are of a similar type to the D.C. boards.

In addition, there are some eight circuits ranging in capacity from 25 to 150 amperes, in connection

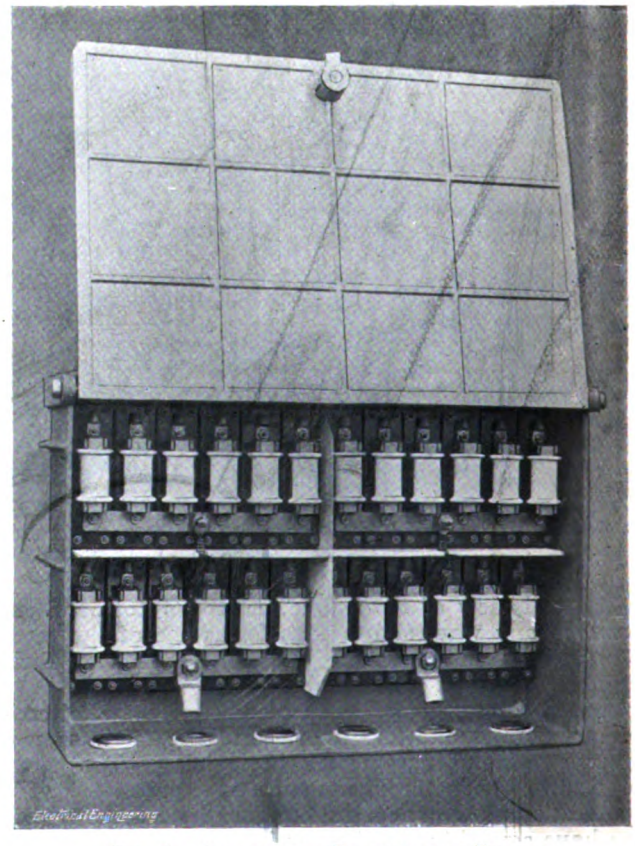

Fig. 3.—One of the Distribution Boards.

with the glow lamp illumination of the front, and the domestic lighting of the main building.

The service mains from the distribution boards to the stands are all run overhead as required, and the cables are brought down the building columns to the exhibitor's switchboard, on which the main switches and fuses and meters are mounted by the management. The whole of the main switchgear on the stands is of the "fool-proof" type supplied by Messrs. Berry, Skinner & Co.

In the case of some dozen exhibitors demanding a large supply, underground mains are laid direct to

Digitized by Google

their respective stands, and are controlled directly from the sub-station distribution panels.

The whole of the wiring of the building as thus far described has been almost entirely carried out by the electricity department of the Corporation. It has not been deemed necessary to use rubber-covered cable, as the cables are simply cleated to the woodwork of the building. Hard-drawn copper wire is employed, insulated with two tapes which are impregnated with gutta percha compound, and then single braided and soaked in preservative compound. The material has been supplied by Messrs. Connolly Bros., Ltd.

Some 16 circuits control the general illumination of the building. For the interior, 44 flame magazine arc lamps have been erected, 28 of the Oliver pattern and 16 by the General Electric Co., and the Gilbert Arc Lamp Co. has supplied six enclosed arcs. There are also four General Electric shuntless arcs for the emergency exits. For the approach road lighting eight multiple carbon flame arcs have been supplied by the Gilbert Arc Lamp Co., who have also four single carbon lamps on the Wilmslow Road outside the exhibition, and high up over the front of the building are 12 Westinghouse flame arcs. Cooper-Hewitt lamps are fixed on the four ornamental towers.

The wiring contract in connection with the arc circuits, as well as the general domestic lighting, of the dining-room, tea-room, Welcome Club, &c., has been carried out by Mr. J. Lomax Kendall, of Manchester.

In addition to the arc lighting of the front of the building, nearly 2,000 coloured lamps on "Pixielite" strip will be used for the decoration and illumination of the front and the trees, which form an effective foreground to the site. This portion of the work was entrusted to Messrs. Pearson & Co., of Manchester.

The illuminated sign, "Electrical Exhibition," on the front of the building has been lent by the Blackburn Corporation Electricity Department.

The interior arc lighting of the building is arranged on 16 circuits, eight of which are connected to the "emergency" panel of the switchboard already mentioned. All the lamps are four in series, balanced across the three-wire system

The whole of the work incidental to the lighting and power supplies and general illumination of the building has been planned by and carried out under the supervision of Mr. S. L. Pearce, the Manchester City Electrical Engineer, with whom has been associated as joint Consulting Engineer to the Exhibition Management, Mr. V. A. H. McCowen, Borough Electrical Engineer of Salford.

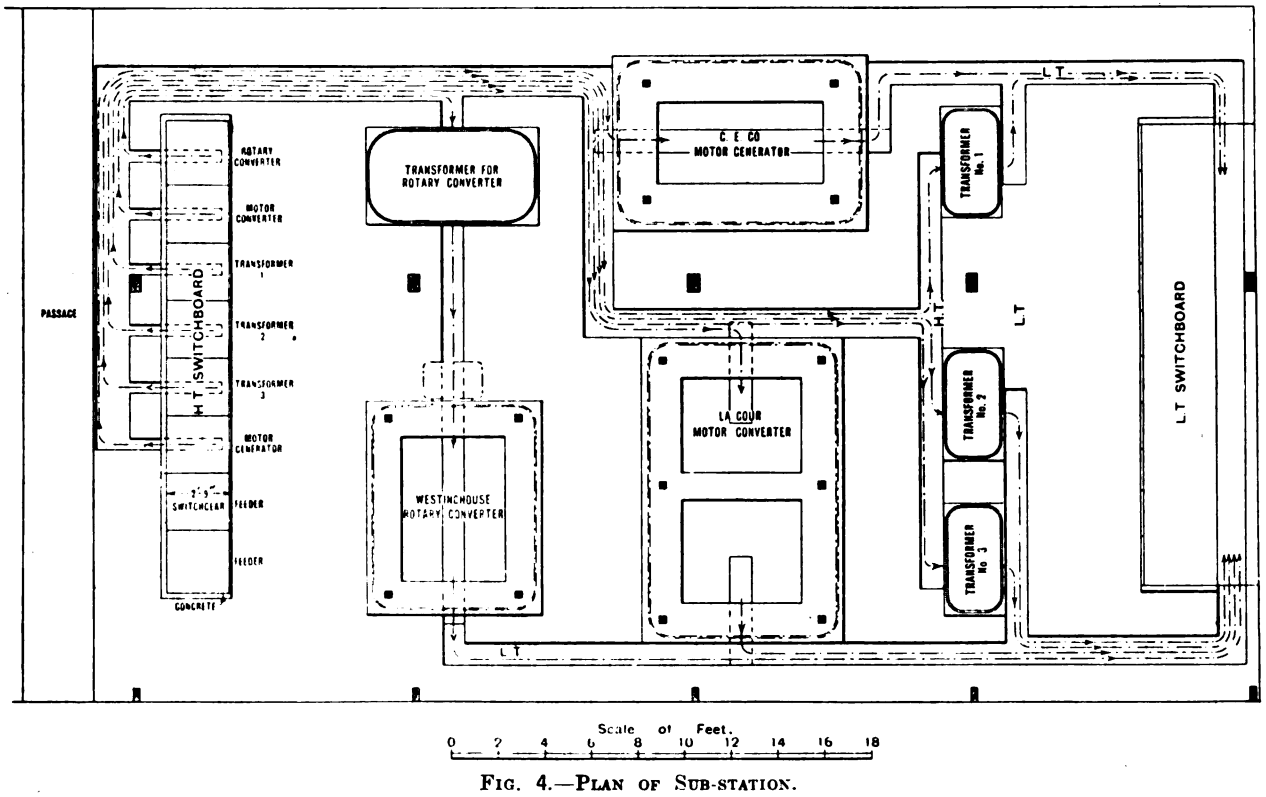

FIG. 4.—PLAN OF SUB-STATION.

International Telegraph and Telephone Congress.—A banquet was given last week in Budapest in honour of the International Telegraph and Telephone Congress. Major O'Meara, chief engineer to the General Post Office, gave the toast of Hungary.

Proposed Cable Factories in Japan.—An American consular report dealing with the imports of electric cables and wires into Japan states that the annual demand for electric wire in Japan amounted to about 8,000,000 yen (£797,000) in recent years. Statistics show that 5,000,000 yen (£498,000) worth of the same was imported the remainder being supplied by Japanese wire factories. In view of the growing demand for electric wire, a mining company is now contemplating establishing a wire factory, where copper is abundantly produced, under its own management. Not content with this, the company is reported to have approached a Yokohama electric-wire factory with a proposal to take up half the capital of the Yokohama establishment, and that the latter will thus be worked under joint management. The Yokohama company will convene an extraordinary general meeting, when the proposal will be fully discussed.

Railway Electrification in Germany.—The question of through-running on the main lines of the State railways in Germany has been brought up recently. As is well known, the Prussian railway authorities, as the result of their extensive experiments on the Spindersfeld line and the favourable results obtained with the single-phase equipment of the Blankenese-Hamburg-Ohlsdorf line, have decided to equip the main lines on that system, using a frequency of 25 cycles as in the above cases. On the other hand, the railway authorities of the State of Baden have decided to employ a frequency of 15 cycles. In commenting on this fact, the *Elektrotechnischer Anzeiger* points out that although in technical circles the relative merits of high and low frequency may be a matter of contention, it is highly desirable that one frequency only should be employed on the main lines of Germany, as otherwise through-running will be rendered extremely difficult. The *Kölnische Zeitung* insists that co-operative action of the various States is essential, as otherwise there will be so many differences in the equipment, both with regard to contact line and rolling stock, that through-running will be rendered impossible.

REVIEWS OF BOOKS

Electrical Engineers' Pocket-Book. By Horatio A. Foster. Fifth edition. 1,600 pp. 36 illustrations. 6¾ in. by 4¼ in. (London: Archibald Constable & Co.) 21s.

The edition now before us of Mr. H. A. Foster's "Electrical Engineers' Pocket-Book," one of the best-known of such works having its origin across the Atlantic, shows clearly by its increase in size as compared with the earlier editions the extent to which additions have been found necessary. The number of pages has been increased by as much as 600, and, indeed, its size and weight, notwithstanding the title, already render it more fitted for the bookshelf than the pocket of the engineer. A study of the contents will, however, show that the revision by no means consists only of addition, as a good deal of the matter in the previous editions has been re-written. It is, we think, not too much to say that the main characteristic of the book is its completeness, which in some sections in particular lifts it out of the level of a pocket-book. It should be pointed out, however, that the descriptions relate almost exclusively to American practice. In a considerable part of the book this is no real disadvantage to British readers, although there are cases where its American origin has to be borne in mind to prevent a false impression being obtained. For example, in dealing with surface-traction systems, detailed descriptions are given of systems developed by the American General Electric Co. and the Westinghouse Co., although the systems better known and used in this country are not mentioned. In the greater part of the traction section, however, the information of American standard practice is of great interest, although the utility of a table such as is given on p. 831 of the relative positions of third rails on different railway systems would have been increased by the inclusion of British lines more recently equipped than the Central London Railway, the only example mentioned. The traction section is, however, one of the best parts of the book, and contains collected together a great deal of information which it would be difficult for the reader to bring together for himself. English engineers will also find some of the tables of conductors, &c., a little inconvenient where the Brown & Sharpe wire-gauge is used, and dimensions are given in circular mils; but we must say that these wire-tables are admirable in their profusion and variety of arrangement. The authoritative nature of the contents is shown by the representative list of American electrical writers who have contributed to the various sections.

It is unnecessary to give a list of the sections into which the book is divided, but to give an idea of the range covered it may be said that after a certain amount of general introductory matter, wires, cables, and other conductors are most exhaustively dealt with, after which there are sections on dynamos, motors, transformers, &c., lighting, traction, power transmission, storage batteries, and switchboards. Telegraphy and telephony dealt with to some extent, as well as the heavier branches of electrical engineering, and chapters are included on the uses of electricity in the United States Army and Navy, electrical automobiles, electrochemistry and electrometallury, X-rays, electric heating, &c. A short mechanical section is given at the end. Some of these sections are entirely new, and most have been considerably enlarged. Extensive revision has naturally been entailed in both the incandescent and arc lamp sections by the advent of methods of illumination of improved efficiency, but progress has been so rapid in this direction that further advances have already been made since the work went to press. The general aim in the compilation has been the provision of tables rather than mathematical formulæ, and except perhaps in the meter section, there is little that is reminiscent of the manufacturer's catalogue.

The value of such a vast collection of information largely depends on the completeness and clearness of the indexing, and we are pleased to see that since the last edition a long classified table of contents arranged in the order of the pages, and therefore according to subject matter, has been added at the beginning of the book, and that the alphabetical index at the end has been printed in much clearer style than formerly.

Electric Lighting and Power Distribution. By W. Perren Maycock. Vol. I. Seventh edition. Pp. 599; 7½ in. by 5 in.; 333 illustrations. (London: Whittaker & Co.) 6s.

The title of this book is somewhat misleading, as in the present volume there is nothing that could be classified under either Electric Lighting or Power Distribution. The sub-title, "An Elementary Manual of Electrical Engineering," would have been more suitable, as the first four chapters deal exhaustively with the principles of electricity and magnetism, and are followed with an excellent chapter on bells, and bell and indicator circuits. The contents of the remaining chapters, which deal with the magnetisation of iron, electrical instruments, and the elementary theory of electric generators respectively, have been thoroughly revised and brought up to date. Although much has been re-written and condensed in order to make room for the new matter, the volume now contains 167 more pages and over 100 more illustrations than in the previous edition. Several examples of modern continuous-current generators are illustrated and briefly described in the last chapter, and amongst these is an interpole compensated turbo-generator of the Westinghouse Co., with radial commutator. The diagrams and figures are on the whole very good; a few only reveal the fact that they originated some years ago, when methods of reproduction were not so perfect as they are now. With regard to the index, it is surprising that with the wide circulation this book has had no one has ventured to suggest an improvement in this direction. The figures refer to the numbered paragraphs and not to the pages; this system may have its advantages, but, if used, great care should be taken to ensure that the numbers of the paragraphs stand out well. In the book in question this precaution is not taken; the paragraph numbers are, as it were, let into the text, and are in the same type as the figures in the paragraphs. The result is that it is by no means easy to make use of the index, which is itself very complete without being too long. The separate index to the tables should be found useful.

THE MANCHESTER ELECTRICAL EXHIBITION

Although the Manchester Electrical Exhibition will open on Saturday, when the representatives of the Press will be entertained at luncheon in the dining-hall at the Exhibition at 1.30 p.m., it will not be officially opened until Monday, on which day the Lord Mayor of Manchester will pay an official visit at noon, and will afterwards lunch with the committee at 1.30 p.m. In a supplement to this issue we give some comments upon the value of trade exhibitions to an industry, followed by historical notes upon the previous electrical exhibitions which have been held in Great Britain. We also detail the circumstances which have led up to the present Exhibition, and print a list of the officers and council to whose exertions the prospective success of the venture is due. We are also able to publish a map of Manchester, showing the relation of the show ground to the principal railway termini, and the tramway routes, as well as a plan of the Exhibition building, giving the position of the various stands, corrected up to the moment of going to press, in conjunction with an alphabetical list and a numerical list of exhibitors duly revised. It will be seen that there are many additional names since the last list we published. As a guide to those visiting the Exhibition, we have also compiled some particulars of several principal exhibits, drawing attention to their leading features. An illustrated article, descriptive of the sub-station plant and electric supply arrangements, appears on p. 485 in the body of the paper.

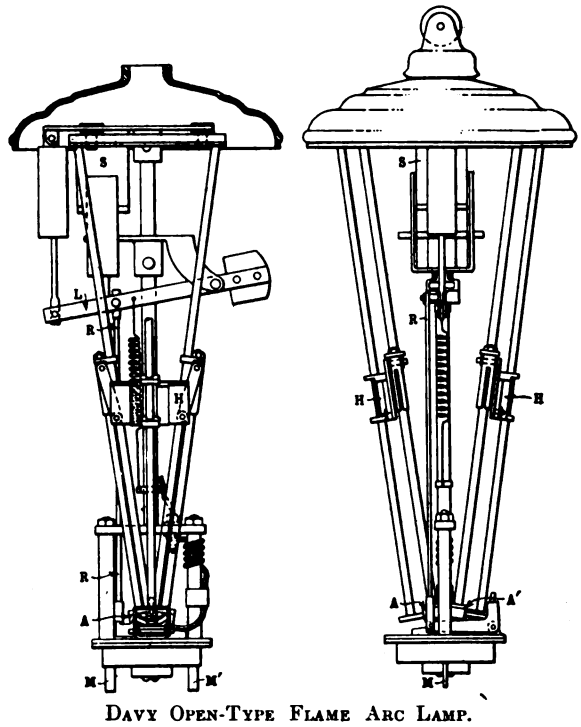
DAVY ARC LAMPS

SEVERAL of the principal manufacturing firms, whose works have been in London, have for many reasons found it advisable to transfer their factories twenty or thirty miles away from the city. The chief of these reasons is, of course, the enormous increase in the rates in all the London boroughs. The difficulty of making extensions and the uncertainty of skilled labour in London are other important reasons. Low rates and taxes are not, therefore, the only advantages to be gained by going into the country; the improved conditions as regards light and air have a beneficial effect on the workmen and, in consequence, on the work done; land is cheap, and there is thus no need for overcrowding; and it is found that the men are more contented and remain longer.

One of the latest of the firms who have left London is Messrs. Arc Lamps, Ltd., who moved last June from the old works in Camden Town to new and spacious premises at St. Albans, Herts. St. Albans is very favourably situated as regards transportation facilities, as it is served by three lines, namely, the Midland, the Great Northern, and the London & North Western Railways. The works, which have a floor-space area of 12,000 square feet, consist of four bays with the modern style of saw-tooth roof, and an adjoining bay of rather different design for the stores department. The whole of the works, with the exception of the offices, has a flooring of cement concrete. Two of the bays accommodate the various machine-tools, which number about one hundred, and include turret lathes, various drills, and a large press. At present these are all temporarily driven by shafting from a single gas engine, but one or more electric motors will soon be substituted for this, and power will be taken for both the motors and lighting from the new St. Albans generating station of the North Metropolitan Power Distribution Co., which is adjacent to the works. The arrangement of the works was carried out under the direction of Mr. W. J. Davy, the managing director, who informed our representative that he considered the above system of driving better than the individual drive system when a large number of small machines with very variable loads were under consideration. The remaining two bays contain the fitting benches. The whole of the shop is visible from the foreman's office, and as there is no floor above, supervision is simplified considerably. A portion of one of the bays is partitioned off to form a test-room, and another partition room accommodates the women workers, who do all the light work, which includes winding bobbins and resistance coils, making chains and globe-nets, and enamelling. There is accommodation at present for about 200 hands, but there is plenty of room for extending the works when necessary. The capacity of the works amounts to about 200 lamps per week, besides which there are the various accessories and the repair work. Owing to the extreme competition with foreign firms, it has been necessary to consider every detail with a view to reducing the labour on each part to a minimum. For this purpose a large number of special tools are used; these, although expensive, save a considerable amount of time and labour. One of the most interesting of these special tools is the jig for ensuring that the two holes in the brass blocks just above the "economiser" are bored at the right angle to one another, so that the converging carbons will feed regularly by gravity without jamming. The position of these blocks can be seen in the accompanying figure.

The lamp which we illustrate is a new type of open-flame arc which has just been put on the market. The mechanism of this lamp is extremely simple, the feed of the carbons being produced by gravity only. A series solenoid S acting on a plunger of special construction and opposed by a spring strikes and controls the length of the arc. This arrangement possesses the advantage that the increasing pull of the solenoid upon the plunger, as the latter enters therein, is balanced by the increasing pull of the stretched spring. The result is that the working stroke of the core can be much increased, with at the same time a more equable pull and an increased sensitiveness to current variations. The lever L is connected to an air dash-pot to prevent irregular and jerky movements. Attached



DAVY OPEN-TYPE FLAME ARC LAMP.

to the lever L is a rod R, which is fixed at its other end to the movable brass block A. This block rocks with the movement of the lever L, and thus varies the length of the arc. The other block A' is fixed. The two carbons of like sign converge and touch just below the economiser. As they burn away they are fed downwards by the action of the weight H, which, as can be seen from the figure, slides on a guiding rod. An important feature of the lamp is the magnetic control of the position of the arc. This is effected by means of a few series turns on one of the arms of the iron frame, as shown in the drawing above. One end of this series coil is soldered to the brass frame after passing through a clip, and the other end, shown loose, goes to the series solenoid S. The magnetic path is through the frame and across the air-gap between the projecting iron pieces M, M'. There is considerable leakage from this main path, and the fact that the flux emerging from M' is very slightly greater than that entering M ensures a vertically downward projection of the arc.

International Congress on Electrical Units and Standards.—It is announced that the Lord Mayor will give a luncheon at the Mansion House, on October 16th, to the delegates to the International Congress on Electrical Units and Standards. At the conference, which assembles on the 12th, Great Britain will be represented by Lord Rayleigh, Prof. J. J. Thomson, F.R.S., Dr. R. T. Glazebrook, F.R.S., Sir John Gavey, C.B., Mr. A. P. Trotter, Mr. G. R. Askwith, K.C., Major P. A. McMahon, and Major W. A. J. O'Meara, R.E., C.M.G., with Mr. W. Duddell, F.R.S., and Mr. M. J. Collins, of the Board of Trade, as secretaries. Mr. F. E. Smith and Mr. C. W. S. Crawley are assistant secretaries. We gave a full outline of the programme in our issue for June 11th.

POWER STATION FOR THE GENERAL POST OFFICE IN LONDON

THE total amount of power required for the working of the London Post Office telegraphs and telephones reaches a very considerable figure and the matter of its economic supply has been the subject of a scheme which, although not yet complete, had its inception some time ago. As far back as 1903, after the consideration of offers from two supply companies, the Postmaster-General decided upon the erection of an entirely new power station for the purpose and the laying of the necessary network of mains to the General Post Office and certain of the Post Office telephone exchanges in the Metropolitan area. A convenient site as regards coal and water supply was accordingly acquired on the south bank of the Thames, a few hundred yards west of Blackfriars Bridge, and building operations were subsequently commenced. Although the building itself, with its tall chimney, has been complete for a good many months, the work of equipping the station has been in abeyance. We now learn, however, that this is being proceeded with and the Postmaster-General's decision has been given in regard to the equipment.

Tenders have accordingly been accepted from Messrs. Willans & Robinson, Ltd., of Rugby, who have been appointed main contractors for the plant at a contract price of £24,191. The station will be equipped with steam turbines and surface condensing plant of Messrs. Willans & Robinson's own manufacture and the alternators, water strainer, &c., are to be supplied by Messrs. Dick Kerr & Co., Ltd.

ELECTRIC RAILWAY DISASTER IN BERLIN

A SERIOUS accident occurred on Saturday on the Berlin Elevated Railway (Hochbahn), in which about 20 persons were killed and 18 seriously injured. It appears that one three-car train ran into another almost broadside on at a junction near the Potsdamer Bahnhof, causing one car to be knocked off the track and fall into the courtyard of a cold storage warehouse, some 20 ft. or 30 ft. beneath, and another to remain suspended from the viaduct. The car which fell alighted roof downwards and collapsed entirely. The third car remained on the metals. The train from the Leipziger Platz which ran into the other was comparatively undamaged, although the second of its three cars was derailed.

An official statement by the Administration of the Prussian State Railways states that the accident was due to the driver of the train from the Leipziger Platz disregarding both the home and distance signals, which stood against him. The track and signalling systems are reported to have been in perfect order. The man is uninjured, and, together with the guard of the train, has been arrested. Assistance in clearing the wreck and rescuing the injured was rendered by the fire brigade and the employees of the cold storage establishment into which the car fell.

The accident took place at one corner of a triangle, where the trains going into the loop to the Leipziger Platz branch off from the through line. These are very busy junctions, as about every third train passes along the further side of the triangle without going to the Leipziger Platz, but it would appear that no automatic appliance is used to stop the trains or even warn the driver in case of the signals being overrun. The signals are so interlocked that when the through road is signalled clear, the signals on the branch line are automatically placed at danger.

ELECTROMETALLURGY AND ELECTROCHEMISTRY

IN the August number of the *Journal of the Chemical Society* Mr. H. C. Greenwood contributes an article upon the "Reduction of Refractory Oxides by Carbon." The object of the research was to determine the temperatures at which carbon commences to reduce some of the more difficultly reducible metallic oxides. The knowledge of metallurgical reactions up to temperatures produced with ordinary fuel-heated furnaces is fairly complete. Also, thanks to the work of Moissan, we have also a very complete knowledge of reductions at extremely high temperatures, such as can be carried out in the electric arc, but not much work has been done in connection with reductions at intermediate stages. Mr. Greenwood has therefore studied the subject from this point of view. A graphite tube was employed which had perforations along the upper side to allow the escape of gases. Water-cooled brass tubes were soldered on to the ends of the graphite tube, which were previously copper plated. The brass tubes were fitted into the side arms of a glass globe, and an air-tight joint was made between the glass and the brass by means of special wax. The heating of the carbon tube was effected by the passage of a direct current up to 300 amperes, which was led on to the water-cooled tubes. Accurate control of the current was obtained by means of a rheostat. The neck of the globe was closed by a rubber stopper with a mercury seal, and connection was made by means of a side tube with a good vacuum pump, the pressure being reduced to half a millimetre. Special precautions were taken to insure absolute dryness of the gases. The temperature of the tube during the actual experiment was raised fairly quickly to a low red heat, and then increased by small steps. The temperature measurements were made by means of a Wanner optical pyrometer, which was used with an ammeter and rheostat in circuit. The temperature at which reduction commences was gauged by the commencement of the evolution of carbon monoxide from a mixture of oxide and carbon. Some difficulty was found in obtaining the exact temperature of reduction owing to occluded gas in the carbon tubes, which was given off as the temperature was raised. It was found, however, that the amount of gas given off from this cause was practically constant, for each temperature it was therefore possible to correct for it. Chromium sesquioxide commences to be reduced at about 1,200°. Manganous oxide showed irregularities. Thus three different samples give reductions at 1,200°, 1,100°, and 1,125°. This was probably due to the different physical state of the oxide employed. Uranium dioxide commences to be reduced at 1,500°; silicon dioxide appeared to form, at about 1,460°, a mixture of silicon carbide and silicon oxycarbide (silicon). Zirconium-oxide appears to form a carbide at 1,400°. Thorium oxide reduces at about 1,400° to a carbide. Tungsten oxide appears to be completely reduced just over 1,100°. Experiments were also carried out with chromium-oxide employing different varieties of carbon. Sugar charcoal causes a reduction at a rather higher temperature than the retort carbon, the lowest reducing carbon being acetylene black.

In the *Centralblatt für Accumulatoren und Galvanotechnik* of September 5th, there is a short note upon the effect of temperature upon the capacity of lead accumulators. Heim found that the capacity of an accumulator was decreased 2·6 to 3 per cent. by the rise of 1° in temperature. Gladstone and Hibbert found that from 15° to 37° the capacity decreased by 50 per cent. Schoop, on the other hand, could not find a greater difference per degree than about 1 per cent. These differences of various observers are difficult to account for, although, of course, the form of accumulator, its age, the thickness of the plates, the acid concentration, and so on will all help to cause differences. Otto Hilderbrand has now carried out experiments upon Planté and pasted plates. He finds that it is not possible to give a general rule which will explain the loss of capacity by rise in temperature. He finds, however, that the type of accumulator employed, the age, and the way in which it has been handled, also the height to which the temperature has been raised, all have their effects, and the higher the temperature is raised the greater the effect. Cells formed by the Planté method would appear to be less acted upon than those made by pasting. Continual increase in temperature lowers the capacity and life of accumulators. Slight increase over 15° did not lower the capacity more than 1 per cent. per degree.

Electric Driving in a Small Works.—We have received from the London Electric Firm of Croydon, whose specialities in arc lamp lowering gear we have several times had occasion to refer to, some particulars of the electric driving of their workshops. They send us a view of one of the shops, driven by a single 5-h.p. motor, installed on a bracket on the wall, and taking up no floor space. This motor drives about 15 machine tools, including universal milling machines, universal grinding machines, lathes, mostly 7-in. and 8-in. centres, and drilling machines, hack saws, &c. The cost for current for driving this particular motor has amounted to about £40 for the past 12 months, working on every week day during the whole year with current at 1½d. per unit, and 5d. during the peak hours.

MUNICIPAL TRAMWAYS ASSOCIATION

SUGGESTED ECONOMIES IN TRAMWAY WORKING.

MESSRS. R. G. and J. G. Cunliffe (Assistant Electrical Engineers, Manchester Corporation Tramways), in a Paper read before the Municipal Tramways Association last Thursday, dealt with the economies which they thought could be effected generally in the working of tramway systems. Dealing first with the line equipment, they said that for mechanical requirements a small trolley wire only, say, 2/0 S.W.G., is required. This, they contended, is quite strong enough, and has better wearing properties than a larger wire, if of hard drawn copper, as the hardness lies in the skin, which is of approximately the same thickness for all sizes of wire, so that a small wire has a greater percentage of skin than has a large one. In Manchester, however, a 4/0 S.W.G. conductor was employed until recently, and now a 5/0 wire is generally installed. This larger diameter, they explained, is advisable because of the energy losses in smaller wires. While they are deferring a full treatment of their method of design for a Paper which they are submitting to the Institution of Electrical Engineers, they stated that they find it economical to allow three or five years, according to traffic density, for the life of the trolley wire, as against the usual allowance of seven years. They appended Fig. 1 to their Paper to demonstrate their point, but they did not offer sufficient data to show how the various curves are obtained. The diagram refers to a 7/0 S.W.G. conductor, the heaviest employed anywhere for tramway work to-day, and yet it will be observed that the heaviest individual loss is the electrical loss, and that it gives the most economical life as only four years. Their calculations, they added, have been carried out for city, urban and suburban lines, with the result that the wire should vary in size from 6/0 to 5/0 to 4/0 respectively, but, as in the city the feeding points are, as a rule, very close together, the difference between the 5/0 and 6/0 wires is only apparent on about two short sections; and so for the suburban lines 4/0 wires is employed, and everywhere else a 5/0 wire is installed. They have found that the same line fittings can be employed for both 4/0 and 5/0 S.W.G. wire, but not for 6/0 wire. The saving varies according to the length of the section and the traffic density, from £1 to £10 per mile of wire per annum, and as Manchester has over 200 miles of overhead line the matter becomes of importance. In addition, maintenance and emergency costs are diminished because the wire is never allowed to wear thin. An interesting side issue is raised in the conclusion that the anchoring of worn lines is a waste of money, as when a line is ready for anchoring it is ready for renewing.

In Manchester triple insulation is employed, the component parts being :—Primary : Insulator bolts in hangers; secondary : globe strain insulators; and tertiary : Brooklyn strains. The primary insulation, they say, is the weakest and least necessary. Experiments carried out in the test room at Manchester have

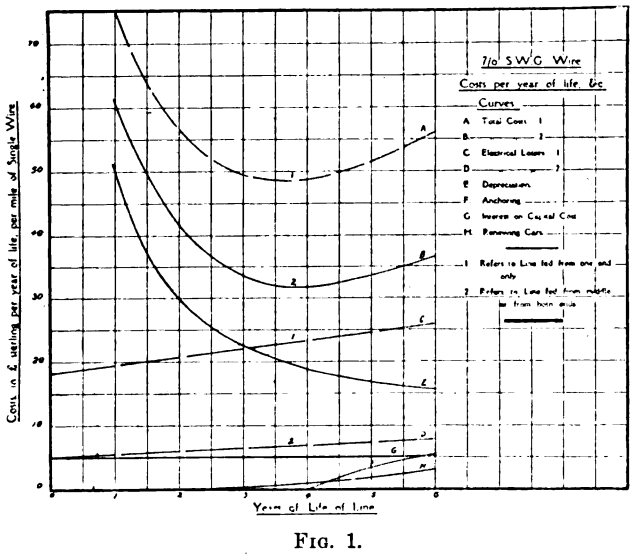

FIG. 1.

shown that, under the influence of capillary attraction and of electrical endosmose, more especially of the latter, water saturated with atmospheric impurities, which in Manchester is a powerful electrolyte, is drawn between the metal bolt and the insulating material, and is forced across from the positive metal of the bolt to the negative metal of the hanger. Electrolysis takes place; the metal of the bolt is corroded; and a rust film is formed beneath the insulation, which is split asunder.

Fig. 2 shows the results of insulation tests carried out from day to day up to the time of writing the Paper on two exactly similar

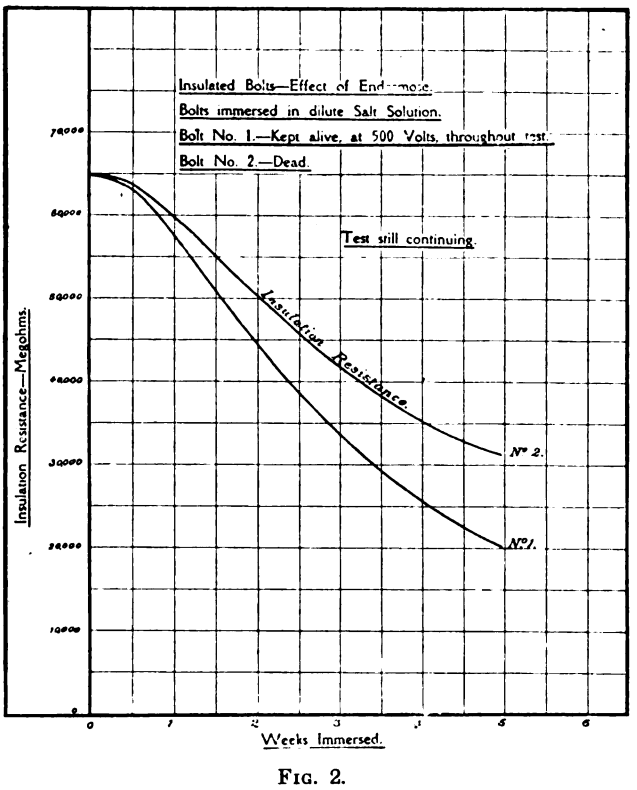

FIG. 2.

bolts fixed in a vertical position in a tank containing a dilute solution of salt, the level of the liquid being kept just above the bottom of the insulation, the part in practice exposed to the weather. Wire gauze was wrapped tightly round the heads of the bolts, and between the water and the gauze of one bolt a potential of 500 volts was maintained night and day throughout the duration of the test, the water being positive with respect to the gauze.

The authors next suggested that considerable benefit might be derived even on level, equally-loaded lines, from having the trolley wires working in parallel, although it is of very little use to have them paralleled at two or three points only by means of "jumpers." They should, the authors said, be paralleled at every span by removing the insulator bolts and building the line as shown in the final section of the Paper, Fig. 7, either with or without the central conductor. It is true that this would cause shut-down of both lines in case of failure of either, but they contended that this is an advantage, as it prevents bunching of the cars at the terminus, and, with an emergency system like that at Manchester, no line fault can keep the service shut down for more than a very few minutes.

Dealing next with the return circuit, they said that owing to the great current-carrying capacity of the rails, there is no financial need to consider electrical losses; in fact, the rails are made far heavier for mechanical reasons than is necessary for electrical purposes. They announced that they would be reading a Paper before the Institution of Electrical Engineers on November 7th, in which they will show that there is no danger of electrolysis under normal conditions, but in case of damp ground between pipes and rails in two or more places some distance apart, damage may be caused.

It has been the practice in Manchester to use a combination of 34″ and 8½″ bonds, mostly 4/0 S.W.G.; two of the former and one of the latter have been used at every joint. The authors express the opinion, however, that in ordinary circumstances there is no excuse whatever for the existence of any bond over 8½″ in length. They support this view by the follow-

Digitized by Google

ing figures :—Resistance of 30″ of 100 lb. rail, fish-plated and bonded with two 34″ Chicago and one 8½″ Crown Bonds, all of 4/0 S.W.G. = 0·000021 ohms at 60° F. Resistance of 30″ of 100 lb. rail, fish-plated and bonded with two 8½″ Crown Bonds = 0·00002108 ohms. The difference is hardly appreciable, yet the saving per joint amounts to the value of one 34″ bond, and the difference in cost between a 34″ and a 8½″ bond. Either joint, they add, is as good electrically as the solid rail.

In further reference to the return circuit, the authors said, as a general principle it is uneconomical to run copper conductors in parallel with heavy steel rails, as the rails themselves have a better conductivity than any copper of an economical section. Thus, in the case of junctions, cross-over roads, &c., it is far better to bond the component parts efficiently together by means of short bonds than to run long copper strips haphazard round the special work. Every inch of copper other than the head in a bond is worse than waste, as it causes loss. A factor which is far more important than rail drop is length of section, as the leakage currents are proportional roughly to the cube of this length. Thus return feeders should be installed at short

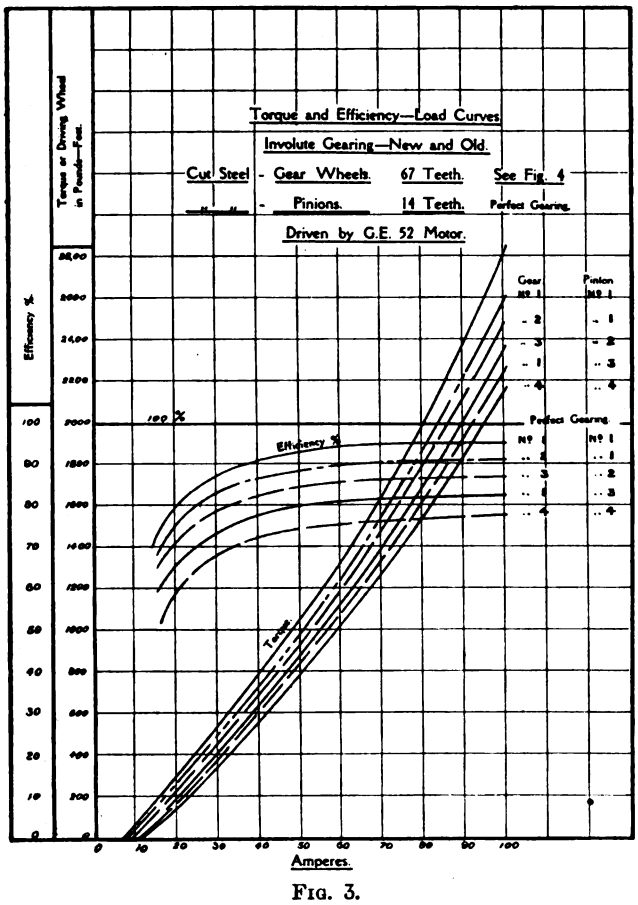

Fig. 3.

intervals, and it is better for each positive feeder to have its negative, as in Manchester. Negative feeders are useless unless they draw the current from the rails in both directions, so that the directions of flow of current in the rail on the two sides of the negative feed point are mutually opposite. If a feeder alone will not cause this reversal, then a negative booster should be employed.

The section of the Paper on car equipment describes as follows some experiments made with a modified controller :—The maximum demand of the car occurs during parallel running, as, the tractive effort remaining about constant, the rate of supply of energy to the car must increase with the speed. In practice this is shown by the doubling of the current in parallel, since the same current per motor is required in order to produce the acceleration, &c. It is important that this maximum demand should be kept low, and this can only be done by diminishing the tractive effort required, *i.e.*, the acceleration, during parallel working, and since a definite average value of the acceleration is required throughout the starting, the acceleration, hence the tractive effort, hence the current, must be increased in the series control, and that without diminishing in the least the time occupied in passing through the series notches, since this time is just as valuable as the acceleration itself in producing speed.

The only way in which the result can be obtained is by diminishing the resistance on the various series notches, and in Manchester a G.E. 52 equipment has been so treated, reducing the resistance on the second series notch, and cutting it out altogether on the third, so that during the whole time allowed for the third and fourth notches the motors are running on the line. Records were taken of the starting current by means of a

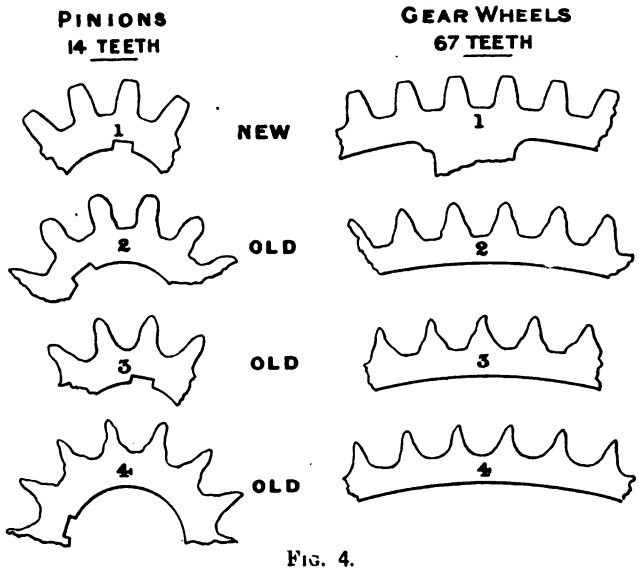

Fig. 4.

specially designed recording ammeter, working at the rate of 12″ per minute, and care was taken never to increase the current beyond the normal full load of the motors. An appreciable increase in series acceleration was obtained, and the maximum demand was reduced by 12 per cent. The increased acceleration was not productive of jerking, or any other uncomfortable sensations to passengers.

Some interesting curves (Fig. 3) were given to show the importance of keeping gearing in good condition; the profiles of the various wheels and pinions are shown in Fig. 4. In addition, the authors say, the driving axles must be kept perfectly straight, as they "found that a bend of from $\frac{1}{16}$″ to $\frac{1}{8}$″ in the centre would cause a loss of efficiency of from 8 to 16 per cent." The tests were carried out on an inverted single truck, with

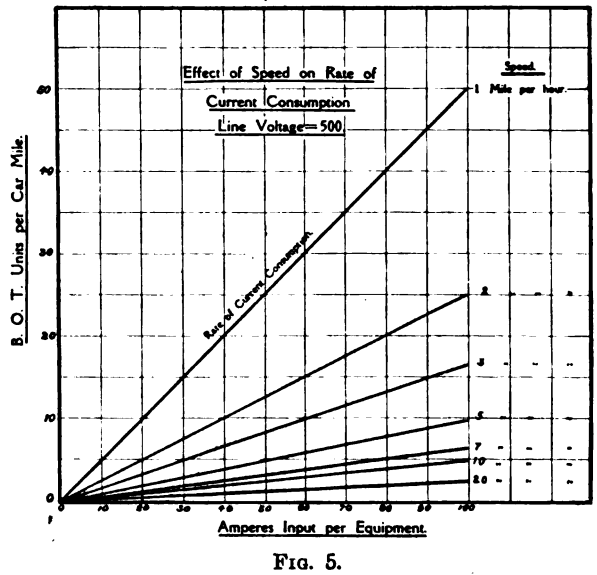

Fig. 5.

the axle boxes and suspension bars fixed on shortened springs in their correct positions, but on the underside of the frame. A specially designed water-cooled band brake was employed, in conjunction with a compound steelyard balance mounted on a tripod, to measure the mechanical output, torque, &c.

It is of advantage, the authors said, to obtain as high an average speed as possible for the system, as thereby not only is the number of cars necessary for a given service diminished, but, although the working current is slightly increased, yet the units per car mile are lower, as the increase in current is not in proportion to the increase in speed, as is shown by Fig. 5.

Digitized by Google

The relation is given by the following equation :—

$$U = \frac{C}{2S}$$

Where U = B.O.T. units per car mile.
C = Current taken by car in amperes (average).
S = Speed of car in miles per hour, the line pressure being 500 volts.

The running costs are shown in Fig. 6, both for series and parallel working.

The following figures were given relating to the Manchester tramways :—During the past working year the account for energy supplied to the system amounted roughly to £143,000,

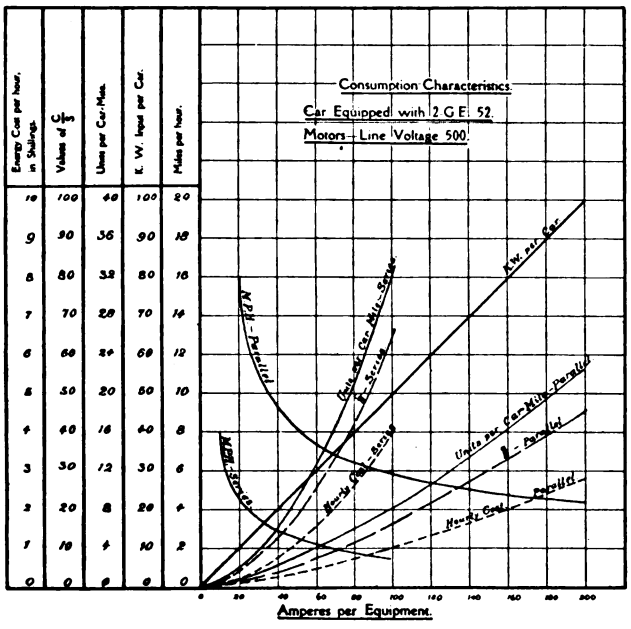

Fig. 6.

so that every one per cent. saved represents over £1,400. By adopting the larger trolley wire Manchester saved several thousands of pounds per annum, in addition to paying the difference in capital costs, &c., and such saving will continue indefinitely. Another large saving is effected by properly maintaining the gearing and axles of the cars. If the gearing is kept in the best possible condition the loss will be £7,000 per annum, but if neglected it can rise to £35,000 per annum. Bent axles may safely be said to account for another £5,000 per annum, and with the slightest neglect this can become £10,000. The efficient maintenance of these parts of the equipment is a costly process, but the care and expenditure are repaid by a saving of many thousands per annum, and the economies effected must, on the whole, make themselves felt even in Manchester's annual expenditure of £500,000 in working costs.

The Paper concluded with the following :—"Suggestions for Profitable Research."—On consideration, it seems strange that a comparatively soft and expensive metal like copper should be employed for trolley wire simply because it possesses good current-carrying properties, and this has led to the adoption of silicium bronze wire, which possesses far better wearing properties than a large copper wire, as it is harder, and, in addition, its hardness extends throughout, as the metal is homogeneous, whereas hard-drawn copper wire consists of soft copper surrounded by a hard envelope. As the conductivity of silicium bronze is only 60 per cent. of that of copper, however, it becomes in the end an extremely costly metal to employ, and the 2/0 S.W.G. silicium bronze trolley wire at present being installed by certain English tramway authorities must be very uneconomical indeed.

In order to combine the mechanical properties of silicium bronze with the electrical properties of copper, the authors suggest the equipment shown in Fig. 7, consisting of two trolley wires of small gauge silicium bronze to take the wear and a central conductor of copper to carry the current. The three would be connected together at every span, the centres of the spans being made of silicium bronze stranded wire in order to carry the current. The present primary insulation would be abolished, together with the costly hangers, a simple gun-metal attachment being required. The tensile strength of silicium bronze is 45 per cent. greater than that of copper, and its resistance is also about 45 per cent. greater for wires of the necessary size, the torsional strength being 20 per cent. greater. Trolley wire fails by cracking about ½" inside the ear, owing to continual vibration equivalent to a bending at the ears, and this would be reduced to a minimum by the adoption of the small gauge silicium bronze, whilst the copper conductor could be stranded, thereby gaining both in flexibility and strength. The first cost would be heavy, but the life of the line would be much greater, and when the time for renewal arrived, only the small silicium bronze wires would require replacing.

Experiments show that the fish-plates provide an important part of the conductivity of the rail points, being on the average better than a 4/0 S.W.G. 34" Chicago bond. As the mass of metal is nearly equivalent to 1 sq. in. of copper, the authors suggest fish-plates with a thin layer of soft copper electrolytically deposited on their edges, tightly screwed to rails having their flanges cleaned and painted with copper sulphate solution. A copper to copper contact would be obtained, and it might be found possible on experiment to dispense with bonding altogether, as with double track efficiently cross-bonded, even the entire failure of a joint would not be noticed.

As both maximum demand and current consumption are proportional to weight of car, this should be kept as low as possible, and any additional expenditure in providing cars of pressed steel with girder sides entirely self-supporting would be repaid by the saving effected.

The most important factor in the current consumption is the driving, and by taking from the driver the control of rate of acceleration whilst leaving him full control of the starting and stopping the car, much could be saved without risk of damage. Thus it might pay to develop a system of control employing one or other of the several alloys at present on the market, possessing the property of automatically lowering their electrical resistance with increasing temperature. Thus, as all the properties are known, it would be possible to design an equipment to start the car at any given rate on the driver putting in the main switch. The only difficulty would be that the temperature of the resistances would not fall quickly enough, but this could easily be overcome.

Motors should be designed for the highest possible torque per ampere, and the starting qualities should be watched just as zealously as the load-efficiency at 500 volts. On systems where maximum demand is of unusual importance, special combinations of the 4-motor equipment are worthy of consideration.

By the insertion of thin sheets of hard steel between the poles and the yokes, a sufficiently high permanent magnetic field to permit of reliable rheostatic braking might be obtained without appreciable loss of efficiency, and the bonding together of the two motor frames makes this independent of the track.

The gear ratio should be as high as is obtainable with single reduction gearing, and the Renolds' silent chain might here be worthy of consideration. The pinions would probably be better made like a truncated cone, with the smaller diameter towards the motor, as pinions worn to this shape give a higher efficiency than when parallel, since with parallel pinions the inner ends of the teeth dig into the metal of the gear wheels, owing to whipping of the armature shaft.

Discussion.

Mr. H. E. Yerbury (Chief Electrical Engineer, Corporation Tramways, Sheffield) said that he preferred varying the section of the feeders, and using trolley wire of uniform size, to varying the thickness of the trolley wire. He inferred from the Paper that at Manchester the section of the feeders had been kept too fine. At Sheffield he had found that galvanised or Sherardised bolts increased the life of fittings. Referring to the authors' remarks to the effect that the rails were made far heavier for mechanical purposes than was necessary for electrical purposes, he called attention to the fact that there was a Board of Trade regulation with regard to the maximum current density in the rails. He was inclined to think that the authors had had no experience with bronze or phono-electric wire, but his experience had lasted several years with bronze wires, and he employed adequate feeders. He found that bronze wire had practically no wear in four years, compared with the 44 per cent. increase in resistance of copper. The only part where bronze wire did wear was at the end of the fittings, where they were attached to the insulators. In Bristol the original bronze wire, put up in 1897, he said is still in use.

Mr. C. J. Spencer (General Manager, Corporation Tramways, Bradford) said that he had experienced considerable trouble with defective field coils, and suggested also that a possible source of loss of energy was deterioration of the insulation between the armature core discs of the motors. He regarded it as essential that the driver must be left control over the rate of acceleration, as it must of necessity depend on the condition of the traffic at the time. But it was advisable to have a check on each man, and therefore at Bradford they used meters on the cars. He did not think that there was much of the whipping of the armature shafts mentioned towards the end of the Paper, and that the chief trouble with armatures was owing to the bearings being allowed to wear away.

Mr. H. Mozley (Corporation Electric Tramways, Burnley) said he had made the experiment of putting in time meters on some cars with 4-motor equipments, and he had found that, since last December, 14 per cent. had been saved in the consumption of energy.

Mr. J. M. McElroy (General Manager, Corporation Tramways, Manchester) said that as they had to pay 1·14d. per unit of current to the Electricity Department, any small economies that could be realised were important. By allowing things to wear, the current consumption would be increased, and the question to be solved was to find out when the increased current consumption was so great as to warrant the cost of renewing the worn plant. The authors' work had thus been of great value to them at Manchester.

Mr. T. R. Smith (Tramways Engineer, Leicester) said that at Leicester they employed 4/0 trolley wire, which had only shown wear at the junctions, &c. They only replaced their wires when it was necessary for safety.

Mr. R. J. Howley (Inspecting Officer, British Electric Traction Co., who was one of the delegates of the Tramways and Light Railways Association to the Conference) did not agree either with the use of an excessively heavy trolley wire, as suggested by the authors, nor the employment of No. 0 wire. He objected to the latter because it was not mechanically good enough. He mentioned incidentally that on the South Staffordshire tramways 1/0 wire had been originally put up, and had lasted some eighteen years. He had a strong suspicion that the wire obtained nowadays was not of the same quality as it used to be. In the current consumption he was convinced that the main factor was the motor. Referring to tests made with wattmeters and time meters, he said that wattmeters were troublesome instruments to have on a car, and on the other hand, time meters, while making the motormen coast more, had frequently the result of making them fail to keep time, as they overdid it. Finally he was of the opinion that the modified design of overhead construction suggested by the authors could not prove more economical than the present methods.

Mr. Spencer rose to explain that he had not made use of either wattmeters or time meters, but of ampere-hour meters.

Mr. W. Wyld (Electrical Engineer and Tramway Manager, Birkenhead) asked what would be the increased weight of the wires on the system suggested by the authors.

Among other questions that were asked were:—How the authors decided when the line was worn out; did they constantly gauge it, or did they wait until there was a fracture? Were the experiments made under running conditions or in the car shed? Also, what was the effect of the size of the trolley wheel on the wear of the wire?

The authors decided to defer their reply to the discussion.

SUPERANNUATION FUNDS.

Among other Papers submitted to the meeting was one by Alderman H. Linsley (Chairman of the Salford Corporation Tramways Committee) on "Treatment of Corporation Employees incapable of Performing Ordinary Duty."

At Salford there is apparently no definite superannuation scheme, but cases of breakdown in health are dealt with by finding the employee lighter work. The Workmen's Compensation Act of course provides sufficiently for cases of accidents. The Old Age Pension system of the Government will not help to solve the difficulty, as motormen, for instance, cannot continue their work until they are 70. In Glasgow they have a Corporation Tramways friendly society, to which each man contributes 1d. weekly, and the committee contribute the same amount as the men. The proceeds from the sale of all unclaimed property found in the cars and the conductors' "overs" are also added to this fund; and nothing is to be drawn from the fund until 1911. No employee is eligible to draw from the fund until he has been in the service and a member of the society for fifteen years, and in any case he has to be physically unfit for any kind of departmental work whatever before he can draw upon the fund. At the end of fifteen years' service an employee has a retiring allowance of 10s. per week, rising to 20s. per week after twenty-five years' service. The Liverpool Corporation Tramways Department have adopted a somewhat similar scheme for providing retiring allowances to their employees. In Belfast a small percentage is deducted from the employee's wage each week, and the Corporation contribute an equal sum. A sick or injured employee is allowed at first a sum equal to half of the average of the weekly wages he receives, and afterwards a payment on a graduated scale. An employee rendered unfit for duty by an accident therefore would receive half wages under the Compensation Act, and the other half from the Corporation Society; and, said Mr. Linsley, he may possibly be obtaining even further relief from other societies of which he may be a member, and thus during incapacity he is for a period receiving more money than when following his employment. The scheme also provides for retiring allowances, both in the case of incapacity through accident or illness, and on a member attaining the age of sixty or sixty-five years, and having been a member of the society for twenty years, he is allowed a retiring allowance equal to one-half of the average of his weekly wage for ten years previous to his retirement.

TICKET CHECK.

A Paper on this subject was read by Mr. L. MacKinnon (Traffic Superintendent, Glasgow Corporation Tramways), who said that the roll ticket had become more or less of an antiquity, and, so far at least as this country is concerned, the bell punch is in general use. He then described in detail the ticket system practised in Glasgow.

THE NEW PRESIDENT AND COUNCIL.

Mr. A. L. C. Fell, Chief Officer of the London County Council Tramways, has been elected President for next year, and Mr. C. J. Spencer, General Manager and Engineer of the Bradford Tramways, Vice-President. The vacancies on the Executive Committee have been filled by the election of Alderman Linsley (Chairman of the Salford Tramways Committee), Mr. Alfred Baker (General Manager of the Birmingham Corporation Tramways), Mr. H. E. Blain (Manager of the West Ham Corporation Tramways), and Mr. Lewis Slattery (General Manager of the Oldham Corporation Tramways). A committee was appointed to deal with the question of rail corrugation, with powers to call in any expert advice that they may deem necessary.

Electric Motors in Mines.—The Presidential address of Mr. G. H. Winstanley, at the first meeting of the session of the Lancashire branch of the National Association of Colliery Managers, is reported in the *Iron and Coal Trades Review* to contain the following remarks:—In many of the larger collieries which have been equipped on modern lines, there appears to be a growing tendency to use steam only for the winding engines, and the power generating plant, and to work all other machinery, both on the surface and underground, by means of electric motors. The only objection which can be urged against such an arrangement is that if the power plant breaks down, or stops for any reason, the whole place is stopped. This objection, however, is more imaginary than real, because in a well-designed plant the power-house will contain several units, that is to say, instead of providing one large engine and generator, equal to the total demand for power, there will be two, three, or more engines and generators, which may either all be worked together, or only one or two worked, according to the demand for power at the moment. This not only obviates the difficulty referred to, but it also tends towards economy, because it is far better to work an engine and generator up to its full load than to work a larger one at half load. In the night-time, therefore, for example, when the demand for power may reasonably be expected to be less than in the day, one, two, or more of the engines may be shut down.

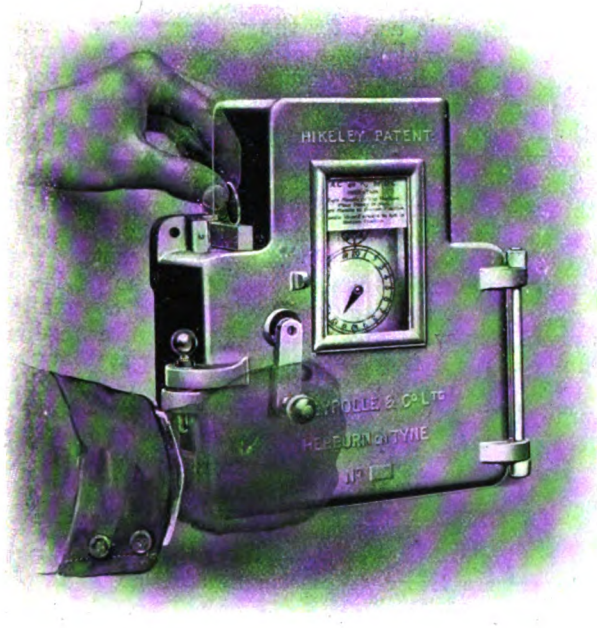
CHARGING FOR ELECTRICITY BY THE HOUR RATE

A METHOD of charging in small installations, where the cost of an ordinary meter is not justified, is coming into use in some places, where the charge is based on the number of hours' use of current, irrespective of the number of lamps that are being fed. This system has met with considerable favour in some parts of Spain, and has lately been developed in England in a tentative manner on the mains of the large supply companies in the Northumberland and Durham areas.

It is therefore of interest to give a few details concerning the Hikeley patent meter, which has been especially designed to meet these requirements for installations up to about eight lamps. Briefly, the meter is supplied for use with alternating or direct currents, and is of the prepayment type. The circuit is closed automatically by putting one or more pennies in the slot, and the switches remain closed for a period depending on the number of coins inserted. The standard design is such that for every penny current can be used for 5½ hours, but the calibration can be altered to suit any other rate.

The general appearance of the meter is shown in the figure. It consists essentially of a clock with an electrically operated detent, beyond which there is no electrical metering gear about it. The clock operates a large toothed disc seen inside the instrument, tending continually to turn in one direction. If this



THE HIKELEY PREPAYMENT TIME METER.

motion goes on uninterruptedly it will, at the end of the travel, operate a trigger which, on being knocked away, allows the switch on the meter to open. The act of putting in a penny and moving a handle in accordance with the directions given, virtually "puts back the hands of the clock," and gives the tenant a further period before the trigger is operated. The motion is effected by first bringing the outside handle, which engages with a drum slotted to receive the penny, to the upward limit of its path. The penny, on being inserted, acts on a connecting piece between this drum and a toothed wheel, controlled by a spring and engaging with the large toothed disc. On bringing down the outside handle the large disc is thus turned through a position equal to one pennyworth, the penny is then dropped into a cash box, and the small toothed wheel is released from the drum. The position of the pointer on the front dial then shows the number of hours' running which the consumer has in hand before further payment becomes necessary. The slot in the drum is made large enough to allow a halfpenny to fall clear, so that if anyone attempts to defraud the electricity supply, the biter becomes bit.

As in slot machines of all descriptions damage is continually done by the insertion of bent pennies, the opening for the admission of coin just allows a straight full-sized penny to pass. The gauge has, however, a slight upward movement, so that, should a bent penny be inserted and stick, it can be lifted slightly and the penny prised from below. The cash box is sealed separately from the cover of the case, so the man who periodically winds up the clock cannot collect the money without breaking the seal. With regard to winding, this in practice is found to be necessary about once a month, as the clock provided runs continuously for a fortnight, and the electrical detent prevents it from working when no current is passing.

The current passes through the winding of the electromagnet, which only allows the clock to run while current passes through it. A current equivalent to one eight-candle power lamp is sufficient for it to operate the detent. The current then passes to one contact of a double switch, with entirely separate arms, through these two switch arms in series to the terminal block of the meter. It is purely in series on one limb of the lighting circuit, no shunt connection being used. The object of the double arm switch is to prevent fraud. One obvious way to close the switch of the meter would be for the action of the handle, either upwards or on its return journey, to bring the brush down into a contact, but this would allow a dishonest person to tie the handle in position without placing a penny in the slot. The way in which this is overcome is to have two separate bridge arms, one closed by the upward sweep of the handle, and the other by its return stroke. Moreover, unless the insertion of a penny has in the meantime caused the disc with the tripping device to be rotated, the trip will immediately operate on the downward stroke of the handle, and no current can be obtained. If there is no money "banked" in the machine in the form of hours to run, the back switch will not operate, but it should be noted that the handle of the meter can, if necessary, be used as a main switch, as the operation of the handle without the use of a penny will not move the pointer either backwards or forwards.

In the illustration it will be noted that the top portion of the window is occupied by a tablet giving instructions as to the working of the meter. The front of the case is hinged and padlocked; if it is swung back there will be seen a set of check dials covered from the consumer's observation by the instruction label, showing the total number of hours that the meter has been working. By comparing the hours run by the money in the cash box the collector can immediately detect theft of money. The electromagnetic detent which holds the balance in such a position that the clock will start again when the detent is withdrawn, can be reached for examination from the back of the meter, which, on being screwed to the meter board, is inaccessible to the consumer. The detent is of peculiar construction, consisting of a thin reed so arranged that, while it yields very easily to the pin on the balance wheel in one direction, it becomes rigid and detains the pin on the return stroke. The detent is withdrawn smoothly on the action of the electromagnet.

It is only necessary to add that the whole design appears to be of very strong and substantial construction, and that the overall dimensions of the device are about 9 ins. by 8½ ins. by 5½ ins. Messrs. A. Reyrolle & Co. have developed Mr. Hikeley's patent, and the first batch of the device made have now been in successful use for about two years.

Imperial College of Science.—Sir William White will distribute the medals, prizes, &c., to the successful students of the Imperial College of Science and Technology in the Lecture Theatre of the Victoria and Albert Museum, South Kensington, on Wednesday, October 7th, at 4 p.m. The Rector (Dr. H. E. Bovey, F.R.S.) will deliver an address.

Railway Electrification.—The Berlin correspondent of the *Financial News* states that it is rumoured that the Allgemeine Elektricitätsgesellschaft, together with the Siemens-Halske Company, has under consideration a project for forming a new company to deal with the electrification of the Prussian railways. In New York, the announcement has been made that the directors of the Illinois Central Railroad Company have decided upon the electrification of their suburban lines at Chicago.

Proposed Tax on Gas and Electricity in Germany.—The exact nature of the proposals for new sources of revenue which are to be put before the German Government has not yet been published, but, according to the *Elektrotechnischer Anzeiger*, very drastic and far-reaching proposals have been made. The above journal publishes an extract from a Berlin paper, in which it is stated that it is proposed to tax not only electric and gas light, but also electrical energy or gas used for power purposes. It is estimated that the total revenue from these sources should be over 60 million marks, which figure, it is stated, could only be reached if the tax were fixed at about 5 per cent. There will, no doubt, be a considerable opposition to such a tax, which would have a very harmful influence on the electrical industry in Germany, and seriously retard progress in the development of the country's water-power resources.

CATALOGUES AND PAMPHLETS RECEIVED

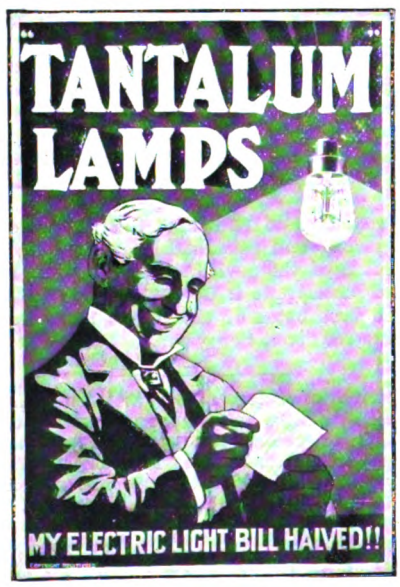
SILENT GEARING.—Pamphlets are to hand from Messrs. W. F. Dixon & Co., describing their improved metal-bushed buffalo raw-hide silent-gears, made at their works at Manchester. These are made in a large number of sizes, up to 4 ft. 6 ins. diameter and 24 ins. face. These pinions are greatly esteemed for the special features of bushing, flanging, and cutting. They are built upon a metal bush made with lugs or keys for driving, and on the outside finished with metal flanges or a plain ring, the function of which is to firmly secure the whole in one piece, and the teeth are machine cut, and the steel or G.M. shrouds are then affixed by steel screws through the entire pinion. No rivets are used. In bevel wheels the teeth are planed accurately to gear with each other.

STORAGE BATTERIES.—A booklet from the Electric Power Storage Co. gives some notes on the history of the development of the storage battery by the firm, followed by a description of the leading features of the E.P.S. forms of stationary cells of the heavy and lighter types, and what are called moting type cells for automobile, launch, and similar work. These latter have an output of 11 watt-hours per lb. Small portable cells and motor car ignition cells are also included, and particulars are given of the latest forms of E.C.C. primary dry cells, which are also manufactured by the company.

ARC LAMPS.—Messrs. Johnson & Phillips have issued a leaflet illustrating their "Magnet-Juno" inclined carbon flame lamp and vertical carbon flame lamps, both of which are of very simple design; a still newer pattern is a single enclosed clutch type lamp of compact form. The same list also includes prices of the firm's well-known ordinary open type arc lamps. They ask us to state that the list will be sent to anyone upon request.

TANTALUM LAMPS

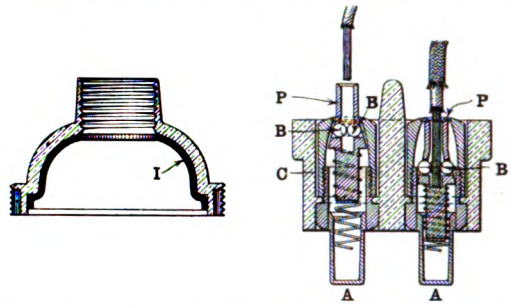
WE understand that Messrs. Siemens Bros. Dynamo Works, Ltd., are making a great feature of advertising their tantalum lamps in a very effective manner, and have placed a large contract for bill-posting on public hoardings in the provinces, and for the display of similar smaller advertisements in the Underground Railway and Tube carriages in London. A large poster, of which the accompanying illustration is a repro-



duction, has been prepared. The expression of satisfaction on the face of the consumer who finds that his electricity bill has been halved is delightful, and the displaying of this should be of considerable value in the campaign of electricity against its natural enemy, gas. A reproduction of this poster in neat show-card form will be supplied on application to Messrs. Siemens Bros. Dynamo Works, Ltd., at 6 Bath Street, City Road, E.C.

A NEW LAMPHOLDER

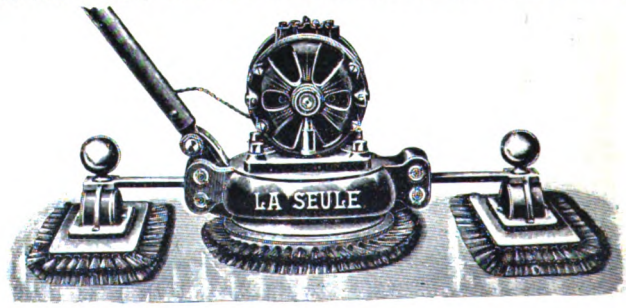
AN exceedingly ingenious new lamp holder is being put on the market by Messrs. Drake & Gorham, Ltd.—one which will save an enormous amount of time and trouble in fitting and is likely to have a great vogue. All men who have anything to do with house-wiring know how much time is wasted in the operation of connecting up the ends of a pendant "flex" into the lamp-holder terminals. The new holder is designed to simplify this by the substitution for the screw terminals of a simple clutch arrangement. The wire is just pushed into the terminal and is held tight. The illustration below shows a section of the porcelain interior C of the holder and also the dome; the outer case of the holder is of the ordinary standard shape and design. In the figure the left-hand terminal is shown as it is before the wire is inserted, and the



right-hand terminal during the act of inserting the wire. The terminal is in the form of a conical plunger, P, with three small recesses in which brass balls, B B, are placed in such a way that they project slightly and touch the bush which holds the plunger in place. The wire is pushed in, forcing down the plunger against the action of a helical spring (which is the same spring as is used for the ordinary pins, A A, for the lamp terminals) and at the same time pushing out the three balls and finding its way to the bottom of the hole below them. This is the position shown at the right-hand side of the illustration. On releasing the wire the spring presses the balls against the side of the bush and makes them grip the wire tightly within the plunger, and pulling the wire merely tightens the grip. The dome of the holder has an internal insulating covering, I, to prevent the terminals from making contact with it. The device is a very clever one and is sure to be popular, especially as its price is very little in excess of that of an ordinary lamp-holder. A frivolous member of our staff suggests that the name given to it, "the Automat," might be improved upon; he proposes "the drum and fife band"—because there is no fiddling about it.

AN ELECTRICAL FLOOR POLISHER

AN ingeniously constructed electrically-driven machine for polishing parquet floors has been devised by a Swiss engineer, M. J. Bruyère. The apparatus, by which a great deal of the arduous labour of polishing a floor can be saved, is shown in the accompanying illustration. It produces a combined rotary and reciprocating motion of the brushes, and is driven by a 1/6 h.p. motor, which takes only 1¼ amp. on a 110-volt circuit, and can be connected to an ordinary lamp-



Electric Floor Polisher.

holder. The reciprocating movement of the outer brushes tends to minimise the reaction of the rotating brush, and therefore lessens the pressure on the handle required to keep the whole machine from rotating. It is found that if care be taken to hold the apparatus so that the reciprocating brushes work in the direction of the grain of the wood as much as possible, a much better polish can be obtained with this apparatus than with either rotary or reciprocating brushes alone. It appears that the revolving brush cleans the floor, while the high degree of polish is due to the action of the reciprocating brushes. The motors are of the commutator type, and can be used for either continuous or alternating current. Inquiries relating to the apparatus should be made to M. Rickert, engineer at Zurich.

THE FIRE AT THE PARIS TELEPHONE EXCHANGE

THERE has been much talk and there have been many articles in the newspapers with regard to the fire in the chief Paris telephone exchange in the Rue Gutenberg, briefly reported in our last issue, but very few actual facts as to the arrangement of the exchange have hitherto been made known. A few particulars will doubtless therefore be of interest to our readers.

The total number of underground lines coming into the exchange and coming on to the main frame in the basement were 40,000. On the main distribution frame the connections were made by ordinary paraffined cotton wires, and the rising wires to the switchboard were also of paraffined cotton, for the exchange was built long before the present practice of using fire-proof wire came into vogue. There were four separate switchrooms, and all except one were on the magneto system, and all wired with paraffined cotton cable. The ground floor was taken up with offices; on the first floor was the trunk switchroom; on the second and third floors were the old magneto switchboards; and on the fourth floor of the building the new central battery exchange, about which so much has been heard. This latter was in accordance with modern practice, and fire-proof cables, we believe, were employed. In fact, a photograph, which shows the top floor of the exchange after the fire, has the appearance as if the cables on this part were not burnt at all. Naturally, however, the switchroom on the top floor was destroyed, because there must have been a blazing furnace on the floors below with all the paraffined cotton cables burning. The statement made at the time of the disaster that the fire broke out in the basement is correct, and it is practically certain that it commenced at the main distributing frame.

There appears also to be some misconception as to the task of rebuilding the exchange. Contrary to what has been commonly stated, we do not believe that the chief difficulty will be in finding material to replace the burnt switchboards. Although switchboards for 40,000 subscribers seems a large order, yet it must be remembered that the manufacture of central battery boards for Paris to replace the old plant had already been started; and since the telephone departments of other Governments have kindly promised their assistance to the French Government, there will probably be very little difficulty in finding the necessary new material in a comparatively short time, at all events for a temporary equipment. Two years, which has freely been given as the time necessary to restore telephonic communication properly in Paris, is probably much longer than should be necessary. It is reasonable to expect that the chief difficulty will be experienced with regard to the buildings, for it naturally means a very large building to furnish space for a group of exchanges of this character. In addition to this, those who know the methods of administrative organisation in Paris will be aware that the personal factor will be almost equally important. With a good man in charge, strict discipline, and effective organisation, however, the replacement of the exchange could very well be one of those fine pieces of rapid efficient engineering work with which telephone engineers are not unfamiliar, at any rate in this country. We trust that the reports of dissensions among the officials are not true, or have been much exaggerated, and that the work of re-erection of the exchange is already being initiated on a proper basis.

LOCAL NOTES

ABERDEEN: *Tramway Receipts.*—For the week ended September 23rd, the tramways receipts show a decrease of £206 compared with the corresponding period of last year. From June 1st this year the receipts have decreased by £479 compared with last year.

ARGENTINE: *Cordova Tramways.*—The municipality has granted a further extension of time to the electric tramway company to commence construction, on condition that the guarantee deposited is increased by $75,000, which will remain the property of the municipality if the works are not commenced in the proper time.

AUSTRALIA (NEW SOUTH WALES): *Tramways and Railways.*—The Colonial Treasurer, in his Budget statement, states that the capital cost of the railways up to June 30th last was £45,090,000, on which the net returns gave interest at the rate of £4 18s. 10d. per cent. The capital cost of the tramways was £3,681,000, and the net returns gave interest at the rate of £6 2s. per cent. The railway surplus, after paying working expenses and interest, was £581,000, and the tramways surplus £90,000. The railway mileage worked was 3,472 and the tramway mileage 132. The gross returns of both railways and tramways were within a fraction of £6,000,000. Railway construction was proceeding in order to open up more rich farming districts.

BARNSTABLE: *Electricity Charges.*—A resolution is to be moved at the next meeting of the Council that the charge for electricity for public lighting shall not exceed the rate charged to other large consumers for lighting purposes, and that the Electricity Committee be requested to draw up a scale of charges upon this basis.

BATH: *Purchase of Electricity Works.*—It is stated that the negotiations between the Corporation and Mr. Schenk for the purchase of the municipal electricity works are now so far advanced that the Board of Trade only requires to be satisfied on one particular point before their formal assent is granted.

BIRMINGHAM: *Death from Electric Shock.*—An employee of Messrs. W. P. Griffin & Co., electro-platers, Cliveland Street, Birmingham, accidentally stumbled against a dynamo last week, and received a shock from which he died.

BIRMINGHAM: *Telephones at Railway Stations.*—The Midland Railway Co., is erecting public call offices at practically all the local stations on their Birmingham system. It will not be possible, however, to obtain trunk line communication at these suburban call offices.

BOURNEMOUTH: *Tramway Receipts.*—Recently published returns with regard to the tramway undertaking show a considerable decrease in receipts over the corresponding period of last year.

BRIGHTON: *Electric 'Buses.*—The London Electrobus Co. has applied to the Watch Committee for a licence to run a service of electric omnibuses on routes in the town not served by the Corporation tramways. The company propose to start with six 'buses, and to run at the existing fares over the routes now served by the petrol 'buses, but the Committee has deferred consideration of the application for three months.

CARDIFF: *Condition of Tramway Track.*—At the last meeting of the City Council, Mr. Caskell moved that an expert be appointed to make an investigation into the condition of the tramway track, and to report to the Council, recommending the best way of keeping the track in a satisfactory and safe condition. There was considerable opposition to this, as it was contended that the calling in of an expert entailed a very large expenditure which the city could ill afford. It was ultimately decided that a joint report from Mr. Harpur, City Engineer, and Mr. Arthur Ellis, the Tramways Manager, should be prepared.

CHINA: *Electrical Imports into Hankow.*—Recent statistics show that during the year 1907, the importation of electrical fittings into Hankow showed a slight decrease, but the American manufacturers gained a better foothold on certain articles of this trade. An American consular report states that small 12 and 16 inch desk fans, wall sockets, and plugs, switches and minor fittings of American make, are now commonly seen throughout the foreign concessions in Hankow. In main fittings, however, the American manufacturers cannot successfully compete with the German product.

DUNDEE: *Stair Lighting.*—The Electricity Committee recommend the adoption of a new scheme for stair lighting, which has been proposed by Mr. H. Richardson, the City Electrical Engineer. Under this scheme, the Corporation will undertake the lighting of all such property, and the payment of the cost is to be left for arrangement between the landlord and tenants. The lights will be switched on and off at specified hours.

Tramwaymen's Grievances.—The Corporation tramway employees have made application for an increase of 1s. per

Digitized by Google

week all round. The claim is based upon the fact that recently increases were granted to other employees of the Corporation, and it is claimed that the extra shilling asked by the tramwaymen is necessary to bring all the Corporation employees into line.

Electric Lighting Charges.—On Monday the Electricity Committee considered a report from the City Electrical Engineer (Mr. H. Richardson) on stair and close lighting, in which he proposed that the department should offer to light a property for a certain sum—in the case of a close and a stair requiring four good lights, for 24s. per annum, payable by the landlord, who would probably come to some arrangement with his tenants. The advantages would be that the department would be responsible for the putting on and off the lights exactly at an hour fixed by the Council, varied to suit the time of the year, and that it would not be possible for an evil-doer to put the lights out. It would put an end to the problem of stair lighting, and equally satisfy the Council, the police authorities, owners and tenants, and would generally tend to a most satisfactory state of affairs at a price which, it must be admitted, erred, if anything, on the side of cheapness. The committee approved the scheme, and agreed to remit the matter to the Lighting Committee.

Gas v. Electric Lighting.—A rather novel situation has arisen in connection with the lighting of one of the outlying districts in Dundee, which tends to show the great competition going on at present between the electricity and gas departments. Some time ago Mr. Richardson, the Electrical Engineer, had erected in this thoroughfare four flame arc lamps, the principal cause being to test the lamps. The new light since erected has given universal satisfaction to the shopkeepers and residents in the district, and had come to be looked on with great favour. Evidently under the impression that the arc-lamp lighting was not sufficiently bright, or, might we say, actuated by jealousy, the gas department a week ago suddenly erected large intensified gas lamps, practically alongside the arc lamps. With this new development the situation has become quite complicated, and has caused a lot of attention, while the local Press have also had several paragraphs lately about the subject. A special meeting of the Lighting Committee is to be held to consider the matter.

EAST HAM: *Lamp Hiring.*—The Electric Lighting and Tramways Committee of the Borough Council have adopted the suggestion that the scheme recently approved for the supply of electric lamps, &c., to consumers on the hire system should be extended, whereby intending consumers can be supplied with a smaller lamp, viz., 200-c.p. lamps at 35s. per quarter per lamp or two 100-c.p. lamps at the same charge.

GLASGOW: *Boxes for Disused Tramway Tickets.*—The Corporation have commenced the system of placing boxes on the cars for passengers to place their disused tramway tickets in. It is calculated that about 25 per cent. of the tickets find their way into the boxes.

Tramway Traffic.—The number of passengers carried on the tramway system last week was 4,470,880, compared with 4,614,061 for the corresponding period of last year, the receipts being £17,947 against £18,814. Since the commencement of the financial year on June 1st, the number of passengers carried has been 66,659,813 against 67,893,719, and the receipts £272,859 against £276,246.

HANDSWORTH: *Engineer's Salary.*—With reference to the increase in the salary of the engineer, recorded in our last issue, a meeting of the Handsworth Ratepayers' Association has passed a resolution protesting against this, whilst the undertaking was making a loss.

HANLEY: *I.M.E.A. Meeting.*—The Chairman of the Electricity Committee and the Electrical Engineer have presented a report upon the annual convention of the Incorporated Municipal Electrical Association at Nottingham this year.

HENDON: *Tramways Construction.*—Messrs. Dick, Kerr & Co., the contractors to the Middlesex County Council for the new tramways in this district, have notified the Council of their intention to commence the tramways in Cricklewood Lane and Finchley Road. When this line is completed, it will connect the Great North Road and Edgware Road systems, and it will be possible to travel from High Barnet to Willesden by electric tramway.

HESTON & ISLEWORTH: *Electric Supply Funds.*—At the last meeting of the Council, the Electricity Committee reported that, owing to the deficiency in the electricity revenue fund (amounting at March 31st to £970) and also to the fact that £1,908 is outstanding in respect of the wiring and fitting of consumers' premises, there is a heavy overdraught at the bank on the revenue account. Also, as the profits estimated to be earned during the present year will be comparatively small, the deficiency will not be greatly reduced, and meantime the undertaking is hampered by the want of working capital. Therefore, the Electricity Committee recommend that the Finance Committee should be requested to consider the question of the finances and to endeavour to take some steps to meet the deficiency. The question has been referred to a committee consisting of the whole Council.

HULL: *Post Office Electricity Supply.*—The Electricity Committee has been asked to supply power to the new post office in Lowgate for 131 eight candle-power lamps, 631 sixteen candle-power, and 16 arcs, and for nine motors of an aggregate power of 22½ horse-power.

Electrical Showrooms.—The Engineer has reported that, owing to the electrical exhibition which is being held, he had experienced great difficulty in getting the necessary material from manufacturers for the Corporation showrooms in Waterworks Street. He expected to have sufficient material towards the end of October ready for the lighting season.

Municipal Telephone System.—During the past 12 months there has been an addition of over 300 telephone instruments upon the Corporation telephone system.

IPSWICH: *Wireless Telegraph Installation.*—The Estate Committee has reported that they have agreed to lease to the Admiralty, as a site for a wireless telegraph station, a piece of land containing about four acres, known as the "Lock Meadow," the lease to be for 75 years from the 29th inst., terminable by the tenants at the end of the twenty-fifth or fiftieth year, on giving six months' notice; the rent to be £50 per annum, payable half-yearly. In addition to the rental the Government will also pay a contribution equal to the rates assessed upon the premises, and will take their supply of electric current, which will be a large one, estimated to amount to about £300 per annum, from the Corporation.

KINGSTON-ON-THAMES: *New Telephone Exchange.*—A new telephone exchange has just been completed at Kingston-on-Thames, and the 1,000 subscribers were transferred from the old to the new exchange without a hitch, last week. The new exchange has a capacity for 2,700 subscribers.

LEICESTER: *Electric Lighting Accounts.*—The accounts of the Electric Lighting Department for the past year show that the profit has diminished from £5,946 to £5,295. After deducting capital charges there is a balance of £1,951 to be carried forward. The total capital expenditure to June 30th was £287,461.

LIVERPOOL: *New Telephone Charges.*—The Council of the Liverpool Chamber of Commerce on Tuesday unanimously decided to re-nominate Mr. C. Lancaster to represent the Chamber on the Telephone Committee of the Associated Chambers of Commerce of the United Kingdom. They expressed their full confidence in him, notwithstanding the fact that he is a shareholder in the Telephone Co.

LONDON: *Chelsea Tramways.*—The Works and General Purposes Committee of the Borough Council have been considering the tramway proposals of the County Council in Chelsea, and have recommended their non-acceptance.

Hampstead: Electric Lighting.—A statement submitted to the Borough Council with regard to the electric lighting undertakings shows that the income for the mid-summer quarter was £7,459 3s. 8d., as compared with £7,293 16s. 5d. for the corresponding quarter of 1907.

Southwark: Capital Expenditure.—The Finance Committee of the Borough Council have decided that application be made to the L.C.C. for sanction to the borrowing of a loan of £8,500 to cover the amount standing against the electricity fund capital account.

PONTYPRIDD: *Tramways and Lighting Receipts.*—The receipts from the tramways for July and August amounted to £3,356, compared with £2,092 for the corresponding period of last year. In a report upon the subsidences which have taken place in the track upon the Rhondda Road route, the Electrical Engineer states that the track is getting twisted badly, and will require to be relaid shortly. Owing to the movement of the ground there was a breakdown of the traction feeder on July 31st. The receipts from the Electric Lighting Department for the same period amounted to £1,158, against £931 for the corresponding period of last year.

WALLASEY: *Tramway Extensions.*—The proposal of the Corporation to extend the electric tramways to Wallasey Village is receiving very strong opposition.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BANBRIDGE.—Information has been placed before the Council with regard to an electric lighting scheme, and expert advice is to be obtained.

CASTLEBLAYNEY.—A proposition has been put before the Council for an electric lighting scheme for the district. The matter is now under consideration.

CRAYFORD.—A committee has been appointed to consider the advisability of lighting the parish by electricity.

DUNDEE.—The Secretary for Scotland has sanctioned the borrowing of a further sum of £40,000 in connection with a new station and sub-station.

ELLAND.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £3,000 for the electricity undertaking. Owing to the increased demand for electricity it has become necessary to remove the destructor now attached to the electricity works, and install an additional boiler. The inspector, Mr. R. H. Bicknell, stated that, as the destructor had only been installed five years ago, he was afraid the Local Government Board would not allow the cost of the removal, because it might occur again.

FENTONA.—A proposition for an electric lighting installation in this town is being received favourably, and information as to the probable cost is being obtained from electric lighting firms in Dublin.

GRIMSBY.—The Electric Lighting Committee has reported to the Council that a further £2,000 is required in connection with extensions of mains and services.

Miscellaneous

BECKENHAM.—A Local Government Board inquiry has been held into an application by the Corporation for sanction to borrow £1,750 for the purpose of converting the present system of incandescent gas street lighting into electric lighting.

CROYDON.—The Board of Trade has sanctioned the borrowing of £900 by the Corporation for doubling a portion of tramway track in Cherry Orchard Road. Plans and estimates are being prepared for laying a duct in which to run a new cable, recently sanctioned in connection with the tramways. The estimated cost is £1,321.

DUBLIN.—A proposal is before the Corporation for fitting Osram lamps in existing gas lamps in the streets.

INDIA.—The Secretary of State for India invites tenders for a tramway line. Condition of contract from Director-General of Stores, India Office, Whitehall, and tenders by October 13th.

LIMERICK.—Tenders are invited for the supply and erection of two additional panels to the existing switchboard. Particulars from the Borough Electrical Engineer, and tenders to the Town Clerk by October 2nd.

SOOTHILL NETHER.—On the question of changing street lighting from gas to electricity, a proposition has come from the Yorkshire Electric Power Co., and a deputation from the Council, which has visited some other towns, has reported upon the proposal favourably.

WAR OFFICE.—Manufacturers who wish to be invited to tender for Army requirements are requested to communicate with H. de la Bère, Director of Army Contracts, War Office, London, S.W., stating the particular article they manufacture. The list of goods required from time to time includes lamps, scientific instruments, telegraph poles, traction plant, weldless-steel tubes, wires, cables, and electrical stores.

WARRINGTON.—Tenders are invited for flame arc lamps. Particulars from the Borough Electrical Engineer, fee £1 1s., returnable, and tenders to the chairman of the Electricity and Tramways Committee by October 7th.

WIGAN.—The Wigan Coal & Iron Co., Ltd., are contemplating putting down important and extensive electrical plant at certain of their big collieries in the Wigan, St. Helens, and Leigh districts.

WORSLEY.—The Earl of Ellesmere, now one of the largest private coalowners in England, is about to instal electrical plant at several of his pits in Worsley (Manchester) and adjoining districts.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations, and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.C.—Additions, 26 Throgmorton Street. Architect, W. C. Jones, 32 Bedford Row, W.C.

S.E.—Seventeen houses, Algernon Road, Lewisham. Builders, S. J. Jerrard & Sons, 40 Loampit Vale, Lewisham, S.E.

Proposed church, High Street, Lewisham. Architects, Kelly & Dickie, 446 Oxford Street, W.C.

Addition to boys' school, Northbrook Schools, Taunton Road, Lee, Lewisham. Architect, E. H. Ryan-Tenison, 12 Little College Street, Westminster, S.W.

New street, Herne Hill Road to Dane Avenue, Lambeth. Surveyors, R. Ellis & Son, 45 Fenchurch Street, E.C.

PROVINCES.

ABERDEEN.—Additions, Aberdeen City Hospital (£12,500). J. Rust, City Architect, Aberdeen.

BLACKPOOL.—Promenade widening and improvements (£40,000), and public baths (£25,000). John Shanks Brodie, Surveyor, Town Council.

BRIDGEND.—Alterations and additions, Angleton Asylum. Surveyor, Glamorgan County Council.

BRISTOL.—Additions, East Street Baptist Chapel. Architect, H. Williams, 51 Corn Street, Bristol.

Workshops at Avonmouth Dock, Bristol, for J. Shearman & Co., Ltd., engineers and general ship repairers.

CARLISLE.—Cumberland Infirmary extensions.

CHRISTCHURCH.—New infirmary for Christchurch Board of Guardians. Clerk, Board of Guardians.

CRESWELL (BARNSLEY).—Elementary school (£8,000). Surveyor, Derbyshire County Council.

CROMER.—Public mortuary and dust destructor. A. F. Scott, surveyor, Town Council.

DUNDEE.—Extension of baths (£10,000). J. Thomson, borough engineer and architect, City Council.

EALING.—New hall and skating rink (approximate cost £2,000). Architect, Alfred Burr, 85 Gower Street, W.C.

New hospital. Architects, Hall-Jones & Cummings, Parliament Mansions, Victoria Street, S.W.

FULBOURN ASYLUM (CAMBS.).—Mr. Graham Harris is advising the Committee of Visitors, in connection with the electric lighting of this asylum. Further tenders are to be invited from the gas and electric lighting companies.

GLASGOW.—Houses and shops, Glasgow City Corporation. A. B. M'Donald, City engineer and surveyor.

Houses and shops, Egleton Street, for Caledonian Railway Co.

GRIMSBY.—Fifteen houses, Cooper Road. Builder, R. G. Kitching, 75 Convamore Road, Grimsby.

Parish room, Farebrother Street, for St. Augustine's Church Council.

HENDON.—Factory, Colendale Avenue. Builder, A. J. Staines & Co., 154 Gt. Tichfield Street, W.

Eight new roads on Beddington estate. Surveyor, W. Hollis, Church End, Finchley.

Four detached houses, Templars Avenue. Builder, R. V. Hart, Burgess Park, N.W.

ILFRACOMBE.—Public Library. O. M. Plouse, Surveyor, Urban District Council.

JARROW.—New stores for Jarrow and Hebburn Co-operative Society.

Twenty-seven houses, Wansbeck Street South. Architect, C. W. Bell, 17 Norfolk Street, Sunderland

MANCHESTER.—Addition to mission hall, Teignmouth Street and Rider Street.

Zion Church and Institute, Stretford Road and Mulberry Street, Hulme.

Alterations to White Lion Inn and house, 73-75 Sondell Street, Stonehewer Street, and Back Livesey Street.

Addition, Catholic Apostolic Church, Stretford Road, Hulme.

MERTON.—Proposed sub-fire station at Raynes Park. Surveyor, Merton Urban District Council.

NELSON.—Extensions to St. John's Church (£1,200). Architect, E. M. Bruce-Vaughan, Cardiff.

NEWPORT (Mon.).—Eight houses, King's Parade. Architects, Habershon, Fawckner & Co., 41 High Street, Newport.

Thirty-nine houses. Architects, W. Graham, Hitchcox & Co., Bank Chambers, Newport.

Ten houses, Blenheim Road. Builder, W. T. Case, Chepstow Road, Newport.

OLDHAM.—Extension of infirmary and nurses' home, Rochdale Road, for Board of Guardians. Clerk, Board of Guardians.

SALFORD.—Alterations, Welsh Calvinistic School, Broad Street, Pendleton.

Alterations, Wesleyan School, Gravel Lane, Salford.

SALISBURY.—New isolation hospital for Salisbury and District Joint Hospital Committee (£14,265). Architect, J. H. Goodman, Town Hall Chambers, Reading.

SOLIHULL.—Proposed new isolation hospital. Surveyor, Solihull District Council.

SOUTHAMPTON.—Workshop, Church Army Home, Commercial Road. Surveyor, J. F. Crook, 39 Cambridge Road, Avenue Road, Southampton.

Digitized by Google

Twenty-four houses. Surveyor, S. C. Greenwood, 11 Portland Street, Southampton.

TIPTON (STAFFS.).—Ten houses and outbuildings, Neptune Street. F. Pitt, Dudley.

UXBRIDGE.—Four houses, Otterfield Road, Yiewsley. Surveyor, A. H. Winterburn, Yiewsley, S.O., Middlesex.

WHITEHAVEN.—School (700 places). E. E. Stiven, engineer and surveyor, Town Council.

WILLESDEN.—Alterations to Coronet Laundry, Alric Avenue, by Badenock & Bruce.

Motor garage and stores, Acton Lane. Architect, G. A. Sexton, 42 High Road, Kilburn, N.W.

Formation of new road off Bolton Road. Architects, Trant, Brown & Humphreys, 332a High Road, Kilburn, N.W.

Boiler house and chimney shaft, Leicester Road. Surveyors, M. W. King & Sons, 6 Holborn Viaduct, E.C.

TENDERS RECEIVED AND ACCEPTED

BARKING.—The tender of S. Anderson & Son, Barking, at £7 8s., for installing electric light in Creekmouth School has been accepted by the Education Committee.

BRIGHTON.—The Electricity Committee has approved of the action of Mr. J. Christie, the Borough Electrical Engineer, in accepting an offer by the North Metropolitan Electrical Power Distribution Co. to purchase the disused maximum demand indicators at 11s. each, the Corporation paying carriage and having the instruments recalibrated.

BURNLEY.—The contract for the supply of electrical sundries during the ensuing half year to the Burnley Guardians, has been placed with Mr. J. Rawlinson, of Burnley.

COVENTRY.—On the recommendation of Mr. J. A. Jeckell, the Electrical Engineer, the tender of the Union Cable Co. has been accepted for the supply of cable to the Corporation, and in explanation of his attitude in recommending a foreign tender in preference to one from a British firm, Mr. Jeckell expresses the opinion that prices quoted by British firms were so suspiciously close as to create a suggestion that there is a "ring" amongst British firms to keep prices at a certain level.

CROYDON.—The Lighting and Electricity Committee complained at the last Council meeting, in regard to the contract of the Weber Concrete and Construction Co., Ltd., relative to the erection of three coal bunkers and one ash cover and receiving hopper, together with constructional steel works at the electricity works, that the work had not been executed with due expedition. The Council agreed to a recommendation that, after seven days' notice, the work be taken wholly out of the contractors' hands, the Corporation to re-contract with some other firm. The contract was to have been completed in June.

The Corporation has accepted the tender of Caspard & Co., Croydon, at £151 9s. 4d., for the lighting of its new swimming bath.

DUNDEE.—The following tenders have been received for the Clepington sub-station:—Mason and brick work, Mr. A. E. Linder, Blackness Road; joiner work, Mr. Thomas C. Stocks, Crescent Lane; slater work, Mr. Charles Brand, Overgate; plumber work, Messrs. J. Robertson & Sons, Princes Street; plaster work, Mr. Michael Lawless, Hean's Lane; steel work, Mr. John Mundy, Glasgow. The total cost of all the tenders is about £1,800.

GRIMSBY.—Tenders have been received for the supply of 6,500 tons of slack from hard steam coal for delivery within twelve months. Mr. W. A. Vignoles, the Electrical Engineer, has carried out a number of tests, and after hearing his report the Committee has decided to carry out a lengthy test, burning about 120 tons of coal from one colliery before deciding upon the placing of the tender. There were two prices which came so close together that the Committee could not choose between them without further tests.

HANLEY.—The tender of Messrs. Ferranti, Ltd., for switchboard extensions at £500, has been accepted.

IPSWICH.—The Electric Supply and Tramways Committee have reported that, with a view to obtaining additional fuel economy at the power station by using slack coal, they had accepted the offer of the Crosthwaite Fire Bar Syndicate, Ltd., to fit their furnaces to the power station boilers, on the understanding that, should the economy at the end of a three months' trial prove satisfactory, the furnaces would be purchased. The economy gained by the use of these furnaces and slack coal has fully justified the makers' claims, and it is anticipated that during the twelve months the total saving will be somewhere in the neighbourhood of £400, as compared with last year's figures. The committee have, therefore, informed the Crosthwaite Syndicate that they will purchase the furnaces at the price agreed upon, viz., £85 per boiler, or a total for the five boilers of £425. In moving the adoption of the report, the Chairman of Committee stated that they had been experimenting for weeks and months with various coals, and with these bars they had been enabled to buy coal at 12s. 6d., whereas last year the coal cost 16s. 9d., and it was estimated that they would save something like £1,200 a year. The report was accepted.

MAIDSTONE.—Eleven tenders have been received for the supply of slack coal, and that of Messrs. Corey & Sons, for Scotch screen-washed peas at 10s. 11d. per ton has been accepted.

NEW POST OFFICE POWER STATION.—The Postmaster-General has just given his decision in regard to the equipment of the new Blackfriars power station, and as a result the steam turbines, surface condensers, &c., are to be supplied by Willans & Robinson, Ltd., and the alternators, water-strainer, &c., by Dick, Kerr & Co. Willans & Robinson, Ltd., are the main contractors for this plant, and the contract price is £24,191.

COMPANIES' MEETINGS AND REPORTS

COMPANIA DE ELECTRICIDAD DEL PLATA.—The report for the year to June 30th last shows a gross profit of $59,715, and a dividend of 8½ per cent. is recommended. The output during the year increased by 23 per cent. New machinery consisting of boilers and a 1,200-kw. dynamo have been contracted for.

DEVONPORT & DISTRICT TRAMWAYS CO.—At the annual general meeting on Friday, the report for the half year to June 30th was adopted. The total capital expenditure on that date was £162,184. The total revenue for the half-year amounted to £11,812, and after deducting all expenses chargeable to revenue, including debenture and other interest, there is a surplus of £579, to which is added £156 brought forward. The total balance of £736 is to be carried forward. The directors report that during the next few years considerable expenditure will have to be incurred in relaying portions of the track, and they have, therefore, transferred for this purpose the sum of £6,749 from the depreciation and reserve fund to the permanent way renewals fund. The report further points out that, owing to the unsatisfactory condition of the company during the past few years, overtures have been made to the Corporation with regard to concessions in the terms under which the company now works, or, alternatively, that the Corporation should purchase. The Corporation, however, have declined to grant any concession, nor have they given a definite answer on the question of purchase.

DICK, KERR & CO.—At the ordinary general meeting on Tuesday, the report and accounts given in our last issue were adopted. Mr. J. Kerr, chairman of the company, presided, and said that it was with regret that the directors had to announce a decrease in the profits compared with previous years. This was entirely owing to the very severe competition met with in every department, and was in no way due to slackness on the part of the directors or restriction in the efforts of their very energetic and capable staff. The position had been further affected by the financial crisis in America, whilst municipal borrowing had also been considerably restricted. The electrical industry, he said, had for some years past been engaged in a very serious struggle, and he was sorry to say that, at the moment, at all events, he did not see much likelihood of competition becoming less keen in this country. They were, therefore, devoting most of their energies to developing Colonial and foreign business, and it was interesting to know that a very large proportion of the machinery now manufactured at Preston was for abroad. They had taken a rather important contract for tramway car equipment for the City of Moscow in face of very keen Continental competition, and their business connections in South America, and Japan particularly, had been increasing rapidly. Owing to the great falling off in the demand for electric tramway equipment, they had turned their attention to developing important power schemes, both hydraulic and steam, a class of business which had been very largely exploited in Switzerland, Norway, America, and Canada. In conclusion, he made a respectful suggestion to their financial friends in the City, and asked their good influence on behalf of English manufacturers on those occasions when they found the capital for enterprises abroad. A little patriotic feeling and support might do much in helping the cause both of the unemployed and in-

Digitized by Google

dustrial capital in our own country. Mr. J. B. Concanon having expressed satisfaction at the report in view of the circumstances, the report was adopted as stated above.

HARRISON, AINSLIE & CO.—At the annual general meeting on Friday, it was stated that the arrangements between the company and the electrical company which supplied the electrical pumping plant for the unwatering of the Lindal Mines, will go to arbitration. The chairman said they had been advised that the plant has not yet proved itself equal to what was guaranteed, and differences have consequently arisen. As all the parties concerned are desirous of avoiding litigation, it was confidently hoped that the questions in dispute would be amicably settled before long. The company was not directly a party to the pending disputes, and he believed they were protected against loss. Notwithstanding those disputes and difficulties, the directors continued their efforts to bring the mines into the highest state of efficency and readiness, and, using the new and the former pumping plant, had succeeded in freeing the mines from water and putting them into a condition to meet any demands up to 1,000 or 1,200 tons per day for many years to come. The cost of the electrical plant was agreed at £50,000 in shares. In the accounts it stands at £64,337, the difference being due to additional necessary works not included in the original contract.

OERLIKON CO.—The report for the year ended June 30th shows a gross profit of 2,558,000 francs. The net profit amounted to 447,354 francs, and a dividend of 4 per cent. upon the 8,000,000 francs paid up capital is announced. The sum of 120,000 francs is carried to reserve fund, and the balance of 7,354 francs is carried forward.

SWANSEA IMPROVEMENTS & TRAMWAYS CO.—The directors' report for the half-year ended June 30th, shows that upon the tramway undertaking the gross receipts amounted to £24,267, being an increase of £1,950 upon the corresponding period of last year, and the expenses to £19,690, an increase of £1,115. The expenses include debenture and other interest, and the amount payable to the Swansea Corporation in respect of the tramways and light railways leased from the Corporation. The profit on the half-year's working is £4,576, to which is added the balance of £1,531 brought forward. The directors recommend that this sum be allocated as follows:—To reserve and depreciation, £1,000; to dividend six per cent. preference shares, £295; dividend five per cent. preference shares, £1,004; carried forward to next account, £3,809. The meeting is on the 7th inst.

WILLANS & ROBINSON.—The report for the half-year ended June 30th last states that as regards Rugby, after writing off £6,510 as depreciation, there is a profit of £18,472 as the result of the half-year's work. As regards Queen's Ferry, there is a net loss on the half-year's working (after contributing to debenture interest and to the directors' salaries) of £2,786. The net profit for the half-year is, therefore, £15,685, and the total amount available for distribution or otherwise, including £7,443 brought forward from last half-year, is £23,129. The directors propose to pay a dividend at the rate of 6 per cent. per annum on the preference shares, absorbing £9,999; to apply £1,750 partly in paying interest upon, and partly in redeeming funding certificates, in accordance with the approved scheme; and to pay a dividend at the rate of 10 per cent. per annum upon the ordinary shares, leaving a balance of £8,046 to be carried forward. The profit for the half-year, though inferior to that for the half-year preceding, is approximately the same as for the corresponding period of 1907. Allowing for the fact that the first half of the year is rarely so good as the second half, it will be seen that the company maintains its position, and as the earnings are more than sufficient to pay the usual dividend, and as there is a considerable balance to be carried forward, the directors do not think it necessary to propose any change. But in view of the present exceedingly unfavourable trade outlook, they think it right to point out that, unless there should be a definite revival of business, it will not be safe to assume that the recent satisfactory progress of the company will be sufficiently maintained to assure the continuance of the present dividend upon the ordinary shares. The Queen's Ferry works were offered by auction on September 16th, but were not sold. No exertion will be spared to effect a sale by private treaty, and in any case it is intended to dispose of that portion of the plant which it is not specially desired to retain with the buildings. Work at Queen's Ferry has practically ceased. The meeting is on the 6th inst.

YORKSHIRE ELECTRIC POWER CO.—The half-yearly meeting was held on Tuesday, at Leeds, when the report and accounts given in our issue for September 10th were adopted. Mr. A. Lupton, who presided, referred to the high price of coal, and said that if the Eight Hours Bill were passed there would be small probability of a return to reasonable prices. Although the company was not directly affected by the deplorable strike in the cotton mills, it must necessarily suffer to some extent, when it was considered that the group of textile industries for which the company supplied power was more important than any other single group of customers, and provided 40 per cent. of their total revenue. With regard to the general slackness of trade, he thought this might not in the long run be entirely a disadvantage, as it was at such times that manufacturers were most disposed to consider economies, and the economies arising from use of electric power were undoubted.

NEW COMPANIES

CORDOBA LIGHT, POWER, & TRACTION CO.—This company was registered on September 24th, with a capital of £500,000 in £1 shares, to acquire the benefit of concessions, grants, decrees, rights, and powers granted by any authority in Cordoba or elsewhere in the Argentine Republic, and to carry on the business of electric power station, waterworks, tramway, railway, and omnibus proprietors, carriers, suppliers of electric light, &c. Minimum cash subscription, 50 per cent. of any shares offered to the public, but no public issue of initial capital contemplated. The number of directors is not to be less than three nor more than seven: the first are Sir John I. Courtenay, 263A St. James's Court, Buckingham Gate, S.W. (chairman); G. Kitchin, Warnford Court, E.C.; T. F. Thomson, 62 London Wall, E.C.; and H. A. Trotter, 7 Mincing Lane, E.C. Qualification, 250 shares. Remuneration, £1,500 per annum, divided. An agreement between T. F. Jackson, for this company, of the one part, and various persons and corporations (as vendors) of the other part, provides for the sale to this company of 3,700 shares of common stock of the Corboda Light & Power Co. (incorporated in Maine, U.S.A.), at the rate of £20 (in shares) for each $100 share. The company is also to acquire from T. N. Vail a further 1,840 shares of the common stock, 4,840 shares of the preferred stock, and promissory notes for 126,000 dollars, the purchase consideration for these being 284,940 shares in this company. The shares and promissory notes to be acquired from Mr. Vail are under arrangements made by him, held on account of over 70 persons and corporations. Registered office, 15 Copthall Avenue, E.C.

EGHAM & DISTRICT ELECTRIC LIGHT CO.—This company was registered on September 23rd, with a capital of £25,000 in £5 shares, to acquire the business carried on at Egham as the "Egham Electric Lighting Syndicate," and to take over among the assets thereof the benefit of a certain provisional order. The subscribers are:—F. S. Powell, The Elms, Egham, diamond merchant; F. J. Powell, 17 Poland Street, W., lapidary; G. Gray, Westwood, Egham Hill, builder; T. H. Martin, 3 Pall Mall East, S.W., surveyor; W. H. Gardiner, 155 High Street, Egham, landowner; E. C. L. Baker, Church Street, Staines, builder; J. Goring, jun., Ironbarks, Staines, butcher. Minimum cash subscription, £5. The first directors are F. S. Powell and F. J. Powell. Table "A" mainly applies. Registered by Jordan & Sons, Ltd., 116-117 Chancery Lane, W.C.

FIXARC LAMP CO.—This company was registered in Edinburgh on September 22nd, with a capital of £1,500 in £1 shares, to acquire from Pierre M. Capitaine, electrician, 29 Rue Floreal aux Lilas, Seine, France, and from the Fixarc Lamp Co., 49 Virginia Street, Glasgow, for all their right and interest therein, the exclusive license to exploit, manufacture, and sell in any part of the world a patent for lamps for electric lighting, registered as "Arc Lamp" in Belgium, and to carry on in France and elsewhere the business of dealers in electric lamps, carbons, and accessories, &c. The subscribers are:—W. D. Hendry, 49 Virginia Street, Glasgow, accountant; J. Robertson, 45 Hope Street, Glasgow, machinery agent. The number of directors is not to be less than three nor more than five: the first are W. D. Hendry, J. Robertson, and W. F. Fellows. Registered office, 49 Virginia Street, Glasgow.

I. T. C., LTD.—This company was registered on September 22nd, with a capital of £10,000 in £1 shares, to make, sell, buy, put up, maintain, and work telephones, telegraphs, electrical apparatus, &c. The subscribers are:—I. Mayer, Woburn House, Upper Woburn Place, W.C., merchant; E. C. Cunnew, 120 Howson Road, Brockley, Kent, traveller; A. Stocken, 3-4 Lime Street Square, E.C., gentleman. Private company. The number of directors is not to be less than two nor more than five: the first are H. Mayer (permanent managing director and chairman) and E. Mayer. Remuneration as fixed by the company. Registered office, 64 Leadenhall Street, E.C.

J. L. MANUFACTURING CO.—This company was registered on September 22nd, with a capital of £20,000 in £1 shares, to acquire the manufacturing business carried on by the Johnson-Lundell Electric Traction Co., Ltd., to adopt an agreement with T. L. R. Cooper, and to carry on the business of manufacturers of and dealers in electric motors and dynamos and their accessories, electricians, electrical and mechanical engineers, iron, brass, and metal founders, boiler makers, &c. The subscribers are:—F. Allen, Duppas Hill, Croydon, solicitor; T. L. R. Cooper, 20 St. Leonards Road, Ealing, engineer; H. Rottenburg, Holmhurst, Dowanhill, Glasgow, engineer; L. B. Oldfield, 16 Eastcheap, E.C., solicitor; J. Allen, 16 Eastcheap, E.C., solicitor; A. Berney, 36 Bensham Lane, W. Croydon, accountant; S. Hill, 72 Masons Avenue, Wealdstone, Harrow, clerk. Private company. The number of directors is not to be less than two nor more than five: the first are T. L. R. Cooper and H. Rottenburg. Qualification, £100. Remuneration (except first directors), £50 each per annum. Registered office, Johnson Street, Southall, Middlesex.

TUNGSTEN METAL CO.—This company was registered on September 22nd, with a capital of £40,000 in £1 shares, to acquire from the Cornish Development Co., Ltd., a leasehold factory for the production of tungsten metal (now in course of erection at Widnes), with the benefit of certain contracts for

Digitized by Google

the supply of wolfram ore, &c., to adopt an agreement with the Cornish Development Co., Ltd. The subscribers are:—F. A. Dangerfield, Duppas Hill, Croydon, solicitor; J. L. F. Vogel, Hillersdon, East Molesey, engineer; J. Allen, 16 Eastcheap, E.C., solicitor; L. B. Oldfield, 16 Eastcheap, E.C., solicitor; A. Berney, 36 Bensham Lane, W. Croydon, accountant; S. Hill, 72 Masons Avenue, Wealdstone, Harrow, clerk; W. T. Furness, 67 Britannia Road, Fulham, S.W., clerk. Minimum cash subscription, 10 per cent. of the shares offered to the public. The number of directors is not to be less than two nor more than five; the subscribers are to appoint the first. Remuneration, £50 each per annum (£25 extra for the chairman), and a share in the profits. Registered office, 56 Cannon Street, E.C.

COMPANY MORTGAGES

BRUSH ELECTRICAL ENGINEERING CO., LTD.—A trust deed dated September 4th, 1908, to secure £125,000 prior lien debenture stock, has been registered. Property charged—Certain freehold and leasehold property in Loughborough, Leics., and the company's other assets, present and future, including uncalled capital. Trustees—Electric and General Investment Company, Ltd., 1 Great Winchester Street, E.C.

EDMUNDSON'S ELECTRICITY CORPORATION.—Trust deed dated August 15th, 1908, to secure £100,000 debenture stock, has been registered. Property charged—£76,900 first mortgage debentures and £5,800 first mortgage debenture stock in various subsidiary undertakings, and the company's other assets, present and future. Trustees—Electric & General Investment Co., Ltd., 1-2 Great Winchester Street, E.C. Trust deed dated August 13th, 1908, securing an additional ½ per cent. per annum, and in certain events a premium of 5 per cent. in respect of £472,000, the amount now outstanding of an issue of £480,000 first mortgage debenture stock secured by trust deeds dated July 10th, 1899, and December 29th, 1903, and seven indentures dated April 27th, 1900, to January 19th, 1906, have been registered. (The deed of August 13th, 1908, is supplemental to the deeds of 1899 and 1903, and indentures of 1900 to 1906.) Trustees—Sir James Bailey, Eaton Square, S.W.; and Anglo-American Debenture Corporation, Ltd., 20 Birchin-lane, E.C.

HORSFALL DESTRUCTOR CO.—Mortgage to bankers, dated March 24th, 1908, securing not more than £3,000.

ST. JAMES'S & PALL MALL ELECTRIC LIGHT CO.—Four and a half per cent. debenture stock, dated May 29th, 1900, securing £150,000.

SUNBEAM LAMP CO.—Particulars have been registered of £10,000 debentures created by resolution of January 28th, 1904, pursuant to Section 10 (3) of the Companies Act, 1907, the amount of the present issue being £1,200. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f., quoted on Tuesday night, was £62 to £62 10s. per ton (same as last week).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The trustee in the bankruptcy of W. A. Roderick, electrical engineer, 12 Penmaen Street, Swansea, has been released.

CAMBORNE MINING EXHIBITION.—The Union Electric Co. has received a letter of thanks from the Royal Cornwall Polytechnic Society for the arrangements which the company made in connection with the lighting of the recent Camborne Mining Exhibition, and for the loan of apparatus.

APPOINTMENTS AND PERSONAL NOTES

Dr. C. C. Garrard has resigned his position of manager of the instrument and transformer department of Messrs. Ferranti, Ltd., in order to take up the position of manager of the switch department of the General Electric Co., Ltd.

Owing to ill-health, Mr. S. B. Cottrell has resigned his position as engineer and general manager of the Liverpool Overhead Railway. Mr. Cottrell, who was at one time on the staff of the Mersey Railway Co., was resident engineer under Sir Douglas Fox and the late Mr. J. H. Greathead, during the construction of the Liverpool Overhead Railway, and upon the opening of the line was selected as engineer and general manager. Mr. Cottrell is at present in Scotland for the benefit of his health, and it is understood to be his intention to commence a consulting practice as soon as the state of his health permits.

Applications are invited for the post of traffic superintendent upon the Metropolitan Railway. Applicants must have experience of the working of heavy local traffic, and a knowledge of goods management. Applications to the secretary of the company by October 17th, endorsed "Traffic Superintendent."

The Leicester Corporation require a shift engineer in the tramway power station, preference being given to one having had previous experience in a large traction station with Corliss condensing engines and Lancashire boilers. Salary 45s. per week, rising to 60s. Applications to the Tramway Engineer.

MISCELLANEOUS CITY NOTES

BERGMANN ELECTRICITY CO.—*The Financial News* states that the Board of Directors will shortly put before the shareholders a proposal for increasing the company's capital from M.14,000,000 to M.21,000,000, by the issue of M.7,000,000 of new shares, which will be offered to present holders at 165.

HOVE ELECTRIC LIGHTING CO.—An interim dividend on the ordinary shares at the rate of 8 per cent. per annum has been declared for the six months ended June 30th.

INTERNATIONAL ELECTRICITY CO.—The *Financial News* states that the absorption of the International Electricity Co. by the Union Bank of Vienna is attracting considerable attention in Vienna. The latter takes over all the assets and liabilities, and will exchange one share of the Electricity Co. for one and a fifth of its own shares, with participation in the dividends beginning from January 1st, 1909. The object of the International Electricity Co. is the working of various electrical systems and patents, and it recently sold its electric light plant to the City of Vienna, the purchase price being 20,000,000k. The Union Bank now proposes to organise a special electro-technical department, under the management of the former directors of the Electricity Co. The capital of the International Electricity Co. is divided into 37,500 shares, and, normally, the Union Bank would have to create 45,000 new shares of its own; but as the bank is already a large holder, an issue of 10,000,000k. worth of new shares will suffice.

KALGOORLIE ELECTRIC POWER & LIGHTING CO.—The directors announce a dividend on the preference shares of 6 per cent. per annum for the six months ending September 30th.

RAILWAY AUDIBLE SIGNAL CO.—Subscriptions have been invited during the week for an issue of 14,793 shares of £1 each of this company, which has been formed to acquire the benefit, except as regards France, of certain inventions relating to signalling on railways. The system is that adopted upon a short length of the Great Western Railway at Fairford, and also between Twyford and Reading, in which condition of the signals is given to the driver upon the locomotive.

TECHNICAL INSTRUCTION.

BOROUGH POLYTECHNIC INSTITUTE,
103, Borough Road, London, S.E.

(Five minutes by Car from Blackfriars, Waterloo, and Westminster Bridges.)

ELECTROTECHNICS DEPARTMENT.

Head of Department:
JOHN HENDERSON, D Sc., F.R.S.E., A.M.I.E.E.

First Year . .	General Principles (for Beginners).
Second Year . .	Technical Applications, including Electric Wiring and Fitting.
Third Year . .	Continuous Current Work: Instruments, Testing Dynamos and Motors.
Fourth Year .	Alternating Current Work, Principles and Theory, Measurements, Alternators, Motors, Transformers, Single and Polyphase Work.
Special Courses .	Electric Wiremen's Work, Construction and Design of Electrical Appliances and Workshop Fittings. Advanced Electricity and Magnetism.

Commencing 28th September, 1908.

For further particulars and detailed Syllabus of each Course, see Prospectus.

C. T. MILLIS, *Principal.*

APPOINTMENT VACANT.

PREMIUM PUPIL. Vacancy for pupil to obtain experience in all branches of Central Station work. Apply ELECTRICITY WORKS, CANTERBURY.

SITUATION WANTED.

DRAUGHTSMAN (25), electrical, mechanical, university, and technical school; four years' experience with good firms. Home or abroad.—D., 24, South Hill Road, Liverpool.

FOR SALE.

ARC LAMP CHARMS. Made in gold, silver, and cheap metal. Splendid advertising novelty. Particulars, JEWELLER (Wholesale), 334, Barking Road, Plaistow.

Digitized by Google

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 24th, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in brackets indicate communicators of inventions from abroad.

1907 Patents

19,570, **Time-Limit Switch.** C. C. Garrard & Ferranti, Ltd. An improved form of relay for opening or closing the auxiliary trip-coil circuit of a circuit-breaker a definite interval after the overload or other abnormal condition has commenced. In those patterns which operate by winding up a suspended weight, the time interval is varied by altering the length of travel of the weight. According to the present invention, two weights are used; one is secured to the end of the cord, and the other slides loosely on the cord. The height of the latter is adjustable, and determines the time interval. The weights are so proportioned that the lower one is wound up by the normal relay current until it touches the upper weight; under abnormal conditions the upper weight is lifted. Variation in the height of the upper weight provides a simple and effective means of adjusting the time interval. Two claims, two figures.

19,883, **Reverse Current Circuit-Breaker.** British Thomson-Houston Co., R. C. Klinker, E. B. Wedmore, and J. E. Woodbridge. A reverse current circuit-breaker for alternating-current systems, with potential and current windings wound on a common magnetic circuit. These two windings act differentially when the current is in the normal condition, but cumulatively on reversal of the current. In the latter case an armature is moved, and this operates the tripping mechanism of the circuit-breaker. A serious defect of this type of relay is the transformer action which takes place between the two windings. To remedy this defect, the present invention provides means whereby a compensating E.M.F. opposing the induced E.M.F. is applied to the current winding of the relay. This E.M.F. is generated in an auxiliary current winding in series with the main current winding. The auxiliary inducing potential winding may be arranged in parallel or series with the main potential winding. A further advantage is claimed when the two potential coils are arranged in series, in that, on the occurrence of a heavy rush of current, the current coils do not exert any inductive effect on the potential windings, as the effects of the two sets of windings neutralise one another. Three claims, three figures.

20,227, **Impregnated Tungsten Filaments.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). A process for the manufacture of metal filaments consisting of a mixture of tungsten and thorium oxide. Fine tungsten powder and thorium oxide are mixed with an alloy of cadmium, bismuth, and mercury, in the proportion of 35 per cent. of the alloy and 65 per cent. of the refractory material, consisting of tungsten and thorium oxide in various proportions. From only a few per cent. to as much as 50 per cent. by weight of thorium oxide can be used. The alloy used as a binding agent is, of course, vaporised, and the filament sintered together in the usual manner. It is claimed that the hot resistance of a tungsten filament with an addition of 20 per cent. thorium oxide is about 50 per cent. greater than that of the pure tungsten filament. As a filament consisting of 50 per cent. thorium oxide cannot be easily welded to leading-in wires, a paste of fine tungsten powder with a trace of water glass is used for making the connection when such a high percentage of thorium oxide is present. If a higher percentage still of thorium oxide is used, the filament becomes brittle, but has a very high resistance, so that very short filaments without supports can be used. Three claims.

1908 Patent

14,805, **Antiseptic Attachment for Telephone Mouthpieces.** J. Freel. According to this invention, it is proposed to prevent the communication of disease, through the medium of a telephone mouthpiece, by the application of a diaphragm of antiseptically treated fine silk to the mouthpiece. The diaphragm can be secured to the rim of the mouthpiece by an elastic ring. One claim, four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

19,870, Kohlen. Burglar and fire alarms.

20,095, Edgcumbe & Everett. Relays for the protection of electric circuits.

20,203, Siemens Bros. Dynamo Works, Ltd. (*Siemens-Schuckert-werke Ges.*). Arrangements for equalising the loads on the phases of polyphase systems.

20,332, Veritys, Ltd., & Gott. Motor controllers.

20,348, Watson & Smith. Multiple trembler induction coil ignition systems.

20,785, Werkner. Electrical transmission of power for propelling vehicles.

20,878, Parsons & Ball. Electrically controlled clocks.

20,986, Bell. Magneto machines.

22,870, British Thomson-Houston Co. (*Allgemeine Elektricitäts-Ges.*). Motor starters.

23,216, Felten & Guilleaume Lahmeyerwerke Akt.-Ges. Means for altering the difference of potential of two points of a circuit between which a practically constant current has to flow.

23,707, British Thomson-Houston Co. (*General Electric Co., U.S.A.*). Control of alternating-current motors.

24,635, Legge & Scott. Arc lamps.

24,993, British Thomson-Houston Co. (*General Electric Co., U.S.A.*). Controlling mechanism for motor-operated railways signals.

25,684, Pendlebury & Rudd. Means for stopping railway trains independently of drivers.

25,740, Beamish. Electrical signalling installations.

25,834, British Thomson-Houston Co. & Clough. Insulating the windings of dynamos.

25,999, Aarhus Dynamo & Elektromotor-Fabrik & Johansen. Motors.

26,489, De Voe. Devices for threading conduits.

26,661, Langham. Portable electric egg-testing lamp.

26,938, Rider. Signalling systems for railways.

27,412A, Bevis & Angold. Arc lamps.

1908 Patents

16, Phillips. Telephones.

620, Fairweather (*Benjamin Electric Manufacturing Co.*). Lamp cluster holders.

700, Agrell. Type-printing telegraphic apparatus.

811, Glenister & Glenister. Insulating wires and cables.

1,754, Lertourné. Preventing the loss of electric energy by heat when working projectors.

2,357, Lambert. Track brakes for tramcars.

4,145, Greenbaum. Coupling talking machines with circuit making and breaking devices.

4,364, Sveinbjornsson. Generation of electricity on railway trains and boats.

4,461, Michaud & Delasson. Process for manufacturing filaments for illuminating and heating purposes.

4,509, Pidd. Guides for pulleys or trolley heads.

5,297, Bleeck. Primary batteries.

6,764, Soc. Ch. Legrand et Cie. Electrically-controlled locks.

8,421, Wolfram-Lampen Akt.-Ges. Filaments.

8,713, Henrique. Interrupter for ignition systems.

8,994, Krause & Harff. Railway signalling systems.

11,221, Scherl. Single-track vehicles.

11,410, Carroll. Fire alarms.

11,415, Norsk Hydro-Elektrisk Kvaelstofaktieselskab. Production of sodium nitrite.

12,336, Roost. Meter for controlling the duration of telephone conversations.

14,910, Siemens-Schuckertwerke Ges. Protective covers for glow lamps.

16,076, Willey & Worsley. Automatic controlling devices for tramcar trolleys.

16,208, Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*). Current transformers.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1907 Patent

24,027, Timar & Von Dreger. Arc lamps.

1908 Patents

3,504, Wenger. Precipitation of electrolytic copper in the form of sheets by iron.

7,705, Nodon. Process for recovering tin from waste mixtures.

11,599, Rittersberg & Rubert. Process of manufacturing filaments for electric lamps from vegetable oils and resins.

13,527, Firm of Robert Bosch. Ignition apparatus for internal-combustion engines.

15,262, Firm of Robert Bosch. Ignition apparatus for large internal-combustion engines.

17,419, Little. Arc lamp electrodes.

17,530, Land-und Seekabelwerke Akt.-Ges. Cables.

17,934, Palmborg. Automatic telephone exchanges.

18,275, Cooper. Regenerative systems of motor control.

POWER SUPPLY AND ITS EFFECT ON THE INDUSTRIES OF THE NORTH-EAST COAST

ONE of the most interesting of the Papers read at the Middlesbrough meeting of the Iron and Steel Institute was that with the above title, by Mr. C. H. Merz.

In this paper, power supply refers to the provision of electricity for industrial use by companies specially constituted for the purpose. Power supply, though of comparatively recent development, has already had the following effects upon the industries of the north-east coast:—A great saving of coal and reduction of smoke has resulted; there is now, apart from the Power Co., practically speaking, no coal burned on the Tyne for power purposes except in chemical factories. The Tyne shipyards and engineering works may be said to have adopted electricity to the exclusion of all other forms of motive power. The application of electricity to all new uses has been facilitated; the suburban traffic facilities of Newcastle are more ample than those of any other town of similar size at home or abroad; and four new rolling-mills are about to be driven electrically. New industries have been established in the district, purely because of the cheap power supply available. A substantial commencement has been made in the utilisation of the waste heat and gases existing in the area, and in this regard the district occupies a unique position owing to the extent to which its future power requirements can be met by electricity produced as a by-product of two of its largest industries, the making of pig-iron and the making of coke.

The station from which the greater portion of the current is now supplied—Carville—was begun in 1903 by the installation of 14,000 electrical horse-power of steam turbine-driven generators producing three-phase 40-cycle current at a pressure of 6,000 volts. This installation has been increased fourfold during the past four years, so that the generating plant now aggregates 56,000 electric horse-power, and Carville has now a greater output of electricity than any other public supply station in Europe. From Carville the transmission and distribution networks extend westwards to and through the city of Newcastle-upon-Tyne, northwards to Blyth, and eastwards along the river Tyne to North Shields, while in a southerly direction the cables at present reach a point some thirty miles south of Carville, and extensions will shortly be completed linking up the northern cable network to the power system which has now been in operation some eighteen months in the Middlesbrough district.

Unity of policy and uniformity of system on the part of the two other large power companies (the Durham Electrical Power Distribution Co. and the Cleveland & Durham Electric Power Co.), have been secured by working agreements. The development has gradually extended northwards and southwards from the Tyne, and it is now possible to obtain electricity on the same system throughout practically the whole area shown on the map in Fig. 1. The capacity of plant installed represents about one-ninth of the total plant installed in public supply stations of the United Kingdom. But as the power companies are working on a more constant load, *i.e.*, a better "load factor," the electricity actually generated is about one-quarter of that generated in the whole of the public supply stations of the United Kingdom.

Though the extension of the power-supply system has been rapid, its development and the growth of its profit-earning capacity were considerably delayed by the work which had to be done from time to time to secure uniformity of system. Unfortunately with each amalgamation or extension of area considerable alterations had to be effected in the system of the new company concerned, as in some cases the frequencies were different. Five coal-fired stations and three waste-heat stations, aggregating 101,950 h.p., are now in operation on the system, and one further coal-fired station (at Dunston) and two waste-heat stations are under construction, which will bring the total plant capacity up to 136,550 h.p.

A factor invariably of vital importance in the production of cheap current, whether by a public company or by a private manufacturer, is the capital expenditure per useful horse-power of plant. This decreases as the size of plant grows, while the running efficiency at the same time increases. The local conditions governing power supply in this district are:—(1) The low price of coal, enabling manufacturers to produce power themselves at relatively low rates. (2) The fact that the manufacturers' works are mostly of considerable size, *i.e.*, their individual electrical requirements are large. (3) The existence of large quantities of potential energy in the form of waste heat and combustible gas.

The first and second conditions have been met by the power companies, in erecting their main generating stations: (*a*) Taking full advantage of the best coal and water facilities available; (*b*) installing plant of capacity much in excess of that which any individual manufacturer, however large, could adopt; (*c*) by catering for all classes of consumers, thereby securing a diversity of load with a resulting constancy of output, and so utilising the plant installed to the best possible advantage.

On considering the various purposes for which the power supply is utilised, the author remarked that there is at the present moment not a single firm of shipbuilders or engineers on the north bank of the Tyne inside the Power Co.'s area of supply which does not take 95 per cent. of its power from the company. Power is also supplied for working the electrified lines of the North-Eastern Railway. There are now four new electrically-driven rolling-mills being installed in this area—two by Dorman, Long & Co., one by the Bowesfield Steel Co., and one by a new company now being formed. The electricity for these will be purchased from the company. The supply of electricity to coal mines, beginning as it did not more than four years ago,

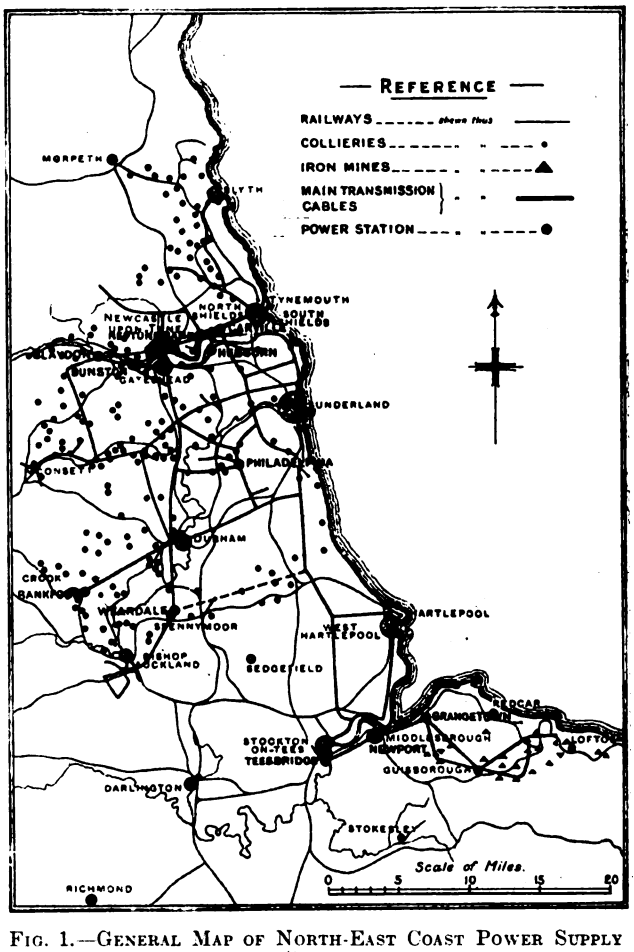

FIG. 1.—GENERAL MAP OF NORTH-EAST COAST POWER SUPPLY SYSTEM.

has not reached the same stage of development as in the case of other industries, though collieries having an ouput of some 8,000,000 tons per annum are taking, or are arranging to take, practically their whole supply from the power companies. This supply will include, among other apparatus, winders of 1,600 h.p. each. It is estimated that the application of electricity to coal mines in this district, when as complete as that to the Tyne shipyards, will render available for outside sale over 1¼ million tons of coal, equivalent to, say, over half a million sterling per annum.

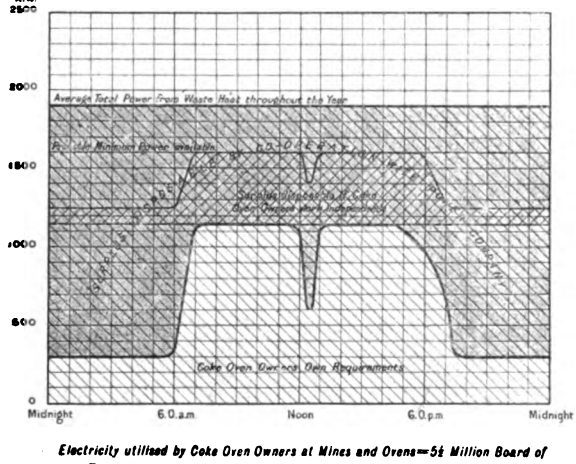
To summarise present results, the three power companies are now responsible for the supply of current to 80 miles (single track) of electrified railway, four tramway systems, the lighting in towns having populations aggregating over 700,000, motive power to the extent of 85,000 h.p., and electro-chemical works of over 12,000 h.p. The last-named are new industries attracted to the Tyne solely by cheap power supply, and there is every indication that their number will in future be largely increased.

Digitized by Google

Mr. Merz then went on to speak of the important question of the efficient utilisation of waste heat. He estimated that in the counties of Northumberland and Durham and the North Riding of Yorkshire, from the working of coke ovens there ought to be available waste gas and waste heat capable of developing over 150,000 h.p. continuously, if used under boilers, or probably a quarter of a million horse-power, if the gas were used in gas-engines. With regard to blast furnaces, he said that if gas-engines were used exclusively for power purposes, then, after the requirements of the stoves and the blowing-engines had been met, there would still be available from the Cleveland furnaces alone a supply of surplus gas equivalent to 61,000 h.p. continuously.

In all cases investigated by the author it has been found that a greater profit will accrue to the coke-oven owner by co-operating with a power company than by proceeding on independent lines. There are three reasons for this :—(1) When a private owner erects a generating plant independently he must install some reserve or spare plant, with a consequent heavier outlay of capital than is necessary to a power company, which, possessing a coal-fired station, need install no spare plant in any of their waste-heat stations, but can, instead, meet any variation of load by the coal-fired station, which also acts as a stand-by against any breakdown. (2) This necessity of putting down spare plant results in smaller, and therefore more expensive and less efficient plant. To take a case—supposing 2,000 h.p. is available, if the station is to be used in conjunction with the power company's system—one 2,000 h.p. unit would be entirely satisfactory, the power system acting as stand-by. If it is to be used in a separate generating station, one would probably install three 1,000 h.p. units—two working and one spare. The gain in the former case in capital cost, running cost, and efficiency is obvious. As a matter of fact, the capital cost in the second case would be nearly double what it would be in the first. (3) The power company, having a market for current many times greater than the output of any individual waste-heat station, can run such a station continuously at maximum output, so utilising completely all the current that can be produced; whereas it is impossible to conceive the power requirements of an individual coke-oven and colliery owner coinciding even approximately over 24 hours with the amount of gas or waste heat available.

ESTIMATED DAILY OUTPUT AND LOAD CURVE OF WASTE HEAT STATION AT CROOK.



Electricity utilised by Coke Oven Owners at Mines and Ovens=5¼ Million Board of Trade Units per annum.

Maximum Surplus available for Outside Sale, if Coke Oven Owners work independently = 2¼ Million Board of Trade Units per Annum.

Surplus disposable by Co-operating with Power Company = 10 Million Board of Trade Units per Annum.

FIG. 2.

Fig. 2, which refers to Messrs. Pease & Partners' installation at Crook, shows the advantage of co-operation very strikingly. It will be seen that the area of the rectangle enclosed between the top line and the base (shown "hatched") represents the total amount of power available, that "hatched" (but not shaded) the requirements of the colliery owner, and that "cross-hatched" the amount disposable had the colliery owner put in his own plant independently, and been able to find a purchaser; it also assumes that the outside purchaser had approximately the same load-curve as the colliery owner himself, which is a reasonable assumption, unless the power be transmitted long distances, as the only users of power in the vicinity of coke-ovens are other colliery owners. The area shaded grey represents the surplus power actually used under the co-operative arrangement.

It is more difficult to get out so typical a curve in the case of blast-furnaces, as the conditions vary so widely. Of course, if a company produces pig-iron only, and does not convert the iron into steel, co-operation with a power company is at present, practically speaking, the only outlet which it has for its surplus power. If, however, a blast-furnace works has a steel mill attached, it may be argued that the correct thing to do is to follow the plan adopted by many large works in Germany, namely, to install gas-engine blowers and gas-driven dynamos at the blast-furnaces, the latter plant producing the necessary power for driving the steel mills.

Capital charges are invariably the controlling factor in the total cost of electricity, and the question raised above, namely, whether it is commercially sound for a blast-furnace owner to co-operate with a power company or not can only be decided in each individual case. It is clear that if it be decided to make the works self-contained, then the supply capacity must always be in excess of the possible demand, otherwise a risk is run of a portion of the works having to be stopped, and as the demand varies from time to time there must be a variable amount of gas utilised involving wastage when supply exceeds demand, or the burning of coal at certain periods when demand exceeds supply. Given an equitable arrangement, it is clear that the same general arguments in favour of co-operation which hold in the case of coke-ovens are applicable to blast-furnaces with steel-works attached.

The power companies in the Newcastle district having their transmission cables interlacing the entire industrial area, and being in a position, with their large load already developed, to utilise any amount of electricity whenever and wherever produced, are arranging for waste-heat stations at different points, turning all the electricity so produced into a common network from which the colliery company, the coke-oven owner, or the blast-furnace owner can purchase any amount he may require, all spare plant and all plant to deal with exceptional peak loads being kept at the main central coal-fired station. To summarise briefly the work which has already been done in the utilisation of surplus power, the first co-operative arrangement made by any of the power companies was brought about by the initiative of the owners of the Priestman Collieries, and resulted in the erection of the power station at Blaydon in 1905. At the present moment the three power companies have at work or in hand five waste-heat stations, three in connection with coke-ovens and two in connection with blast-furnaces. Additional stations are under consideration.

It will be remembered that as regards the Cleveland blast-furnaces the calculations quoted dealt with the surplus available on the basis of the gas being utilised in gas-engines, but the adoption of gas-engines to the exclusion of all other types of prime-mover still lies some distance in the future, and in the majority of cases in Cleveland it is found that steam blowing-engines are used, and that after the requirements of the stoves have been met the gas is practically all expended in raising steam to supply these blowing-engines.

To free any substantial quantity of gas for outside power users would involve therefore the substitution of gas engines for the existing steam-blowers. Considerations of capital expenditure usually forbid this course, and had it not been for the development of the exhaust steam turbine the Cleveland furnaces could not be regarded by a power company as an immediately available source of energy. In this connection, as capital outlay controls so completely the cost of electricity, and as exhaust steam turbines are so dependent on a high degree of vacuum for efficiency (at 26 inches they consume 50 per cent. more steam than at 29), it is perhaps not always easy to justify the policy of installing small exhaust steam turbines inland in conjunction with an intermittent supply of steam such as that from a colliery winding-engine, as this involves a cooling-tower and a regenerator with a consequent poor vacuum and high capital outlay.

Olympia Motor-Car Show.—The annual exhibition of motor-cars at Olympia, promoted by the Society of Motor Manufacturers and Traders, has been fixed for November 13th to 21st. The show will be confined to racing, touring, and pleasure cars and accessories, and a separate exhibition for commercial vehicles and motor boats will be held next spring.

Obituary.—The death occurred last Thursday, at the advanced age of 85, of Sir Samuel Canning, who was well known as one of the pioneers of submarine telegraphy, to which sphere of action he devoted his energies from 1850 onwards. He acted as chief assistant to Sir Charles Bright in the laying of the 1858 Atlantic cable, and had superintended the laying of the Gulf of St. Lawrence cable in the preceding year, and was also connected with various other cable enterprises, including those to Gibraltar, Malta, and Alexandria.

ELECTROLYTIC PRODUCTION OF IRON SHEETS AND TUBES

A PAPER was read by Mr. S. Cowper-Coles at the Middlesbrough meeting of the Iron and Steel Institute, describing an electrolytic process for making tubes, cylindrical vessels, sheets, and wire in one or two operations from crude or scrap iron, or direct from the ore, without the processes of smelting, rolling, or drawing, at a cost that has hitherto been thought impossible.

The author referred to the early work in this branch of electrometallurgy, including that of Bockbushmann in 1846, Feuquieres, Smee, and Klein, and explained some of the difficulties met with in his own experiments in the year 1898 on the production of electrolytic iron plates. These were chiefly the occurrence of gas lines, pits, and exfoliated deposits, but the results obtained were a great advance on what had hitherto been effected, although they were not far enough advanced to be turned to practical account. It was not until the present year that sheets and tubes were obtained of a quality equal to steel, and with a surface that required no after-treatment, such as rolling or drawing.

An electrolytic iron production process, to be of commercial value, must fulfil the following conditions, namely, the voltage between the terminals of the depositing cell must be low, the current density per square foot of cathode surface must be high, and the iron or steel deposited must be in such a form that it can be used for industrial purposes without smelting.

The process briefly consists in placing crude iron (which may contain those elements which are at present so detrimental to the production of high-class iron or steel), or finely divided iron ore, in suitable containing vessels in which an acid solution is circulated, using an insoluble anode material; or, further, the process may combine the use of soluble and insoluble anodes. The crude iron or iron ore being in each case connected to the positive pole of the supply, the iron goes into solution, and is deposited on cylinders or plates which may be either rotated or stationary, depending upon the class of finished product required. It is conceivable that in some cases iron might be recovered without mining, acid liquor being circulated over the ore deposits.

When it is desired to produce a highly finished sheet, a metal sheet of the desired surface is wrapped round the cathode, and held in position by means of grooves and wedges. In this way sheets of large dimensions can be made, by employing a mandrel, say, 8 ft. in diameter, a sheet 24 ft. by 5 or 7 ft. can be produced. When it is desired to produce tubes, iron mandrels somewhat smaller than the internal diameter of the finished tube are coated with lead by electro deposition, or by having lead drawn over them. When the desired thickness of iron has been deposited the mandrel is heated to a temperature sufficient to melt out the lead, and thus admit of its easy withdrawal.

The electrolyte employed consists of a 20 per cent. solution of sulpho-cresylic acid saturated with iron. In some cases it is advantageous to add small quantities of carbon di-sulphide, the temperature of the solution being about 70° C., the current density about 100 amperes per square foot. The solution is kept charged with iron oxide, which is kept in suspension in the electrolyte by means of stirrers, by moving one or both of the electrodes, or by circulating by means of a pump. Excellent results have also been obtained by depositing the iron in a closed cell with a vacuum of a few inches, and also with a chloride solution and porous cells, bleaching powder being produced as a by-product; or the chlorine utilised to form fresh iron chloride.

Amongst other applications the process can be applied to the production of bi-metallic tubing and plates; that is to say, to tubes or sheets coated on the one side with copper or other metals or alloys. The process can also be applied to the direct production of large sheets or strips representing the cutting surface of a file, and cut up into portions of the desired shapes, and secured to suitable backing, to form separate files. The prints are produced by making a continuous impression or a number of impressions from a suitable die, revolving roller, or reciprocating tool in a lead alloy. The matrix thus prepared is mounted on a revolving drum, and steel deposited by the process which has already been described.

Electrolytic steel, with considerable variation in the percentage of carbon, can also be produced. Houllevigue observed that when iron is deposited from iron containing uncombined carbon, the product at the cathode was free from carbon; but when deposited from iron containing combined carbon, the cathode product also contained carbon. The author's observations confirm this statement, and at a future date he hopes to publish figures showing the results that can be obtained. The amount of silicon in the iron can also be considerably varied. An important feature of the electrolytic process will no doubt be the introduction of some new ferrous alloys, which cannot be made by fusion. Alloys of iron and nickel have already been produced electrolytically.

The structure of electrolytic iron varies considerably, and in some cases it is found to be amorphous, whilst in other instances it possesses a structure somewhat similar to that of wrought iron. The properties of electrolytic iron appear to depend largely on the amount of hydrogen present, and therefore on the annealing, which reduces or eliminates the occluded hydrogen. The more hydrogen it contains the greater is its hardness.

Samples tested have given a hysteresis loss of under 0·3 of a watt per pound. The hardest varieties will scratch glass.

There are two distinct varieties of electrolytic iron, with varying percentages of hydrogen; the softer kind of iron is silver-grey in colour, whilst the other variety is very hard and brittle, breaking as readily as glass, and containing a higher percentage of hydrogen. The hardness varies between these two extremes. A surface can be obtained on the latter of a silvery whiteness, and with a mirror finish, without polishing, as will be observed by the specimens exhibited. Either quality can be produced at will by increasing or decreasing the electromotive force at the terminals of the cell.

Iron highly charged with hydrogen is very inert, and not readily attacked by acids. The softer quality is also comparatively inert.

Mr. Cowper Coles considers that the electrolytic production of iron and steel has now emerged from the laboratory or academic stage to a practical conception, enabling iron and steel to be produced in a highly finished form from iron ore or scrap iron, in a condition which realises the highest market value, by a process which reduces labour to a minimum, and under conditions which can be compared to the working of a central electric-light station for cleanliness and health.

The advantages of the system are summarised in the Paper as follows:—

Finished products, such as tubes, sheets, and wire, can be produced at less cost than by the processes of smelting, refining, and rolling. A product is obtained which does not corrode so readily as steel, at less cost. The process can be worked economically when no coal is available. Iron ore that is useless for ordinary smelting operations can be advantageously utilised by the electrical process. The process is a power process, and utilises but little labour. Small units can be worked economically. The process is more cleanly and healthy than the operations of smelting. Little or no scrap is formed.

From figures given in an appendix it appears that the estimated cost of plant for producing 5,000 tons of electrolytic iron in the form of tubes, sheets, and wire per annum, would be £108,295, and the cost per ton of production £5 5s. 3d.

THE POSTMASTER-GENERAL'S ANNUAL REPORT

THE fifty-fourth report of the Postmaster-General, giving an account of the business of the Post Office during the year ended March 31st, 1908, was published on Friday. We give below an abstract of the sections relating to telegraphs, telephones, and wireless telegraphy:—

Telegraphs.

During the year 85,969,000 telegrams passed over the Post Office wires, as compared with 89,493,000 in 1906–7, a decrease of 3·9 per cent. The estimated value of the railway and canal free telegrams is £56,550, against £59,600 in 1906–7; that of the Government free telegrams £20,150, against £22,700 in 1906–7. The decrease in the number of telegrams is, to some extent, apparent only owing to the basis of computation having been somewhat altered, with the view, primarily, of giving a more accurate presentment of the amount of work actually done by the Post Office in connection with telegrams. The decrease in the number of ordinary telegrams is most marked in the case of London local traffic, and is attributed to the increasing popularity of the telephone.

The loss to the State on Press messages, which pass at the special rates prescribed by the Telegraph Act of 1868, is estimated at about £225,000 a year.

Steady progress has been made with the underground tele-

Digitized by Google

graph line between Edinburgh and Glasgow. The line to the West of England will, it is hoped, reach Penzance in the financial year 1908–9, with a spur to Plymouth, as well as to Weston-super-Mare. The construction of this line will greatly diminish the risk of interruption in the important cable routes which start from the West and South-West of England. Underground lines from Birmingham (southwards) and from Bristol (northwards) are being put in hand, with a view to a line hereafter between those two cities; and progress is also being made with the underground line which is to connect Newcastle-on-Tyne with Leeds, and so with the main underground system. The section from Newcastle to Durham has been completed.

The International Telegraph Conference which has just concluded its labours at Lisbon, although not falling within the year 1907–8, may perhaps be referred to. The British delegates were Sir H. Babington Smith, K.C.B., C.S.I., Mr. A. M. J. Ogilvie, Mr. R. J. Mackay, and Mr. F. W. Horne. No very important changes were made by the Conference; but various smaller measures have been agreed to which will help to facilitate international telegraphy, and will be to the advantage of the public. In the International Telegraph Regulations, the Conference incorporated regulations which deal with the acceptance, wire-transmission, and delivery of wireless telegrams to and from ships, and with the accounting arrangements in respect of such telegrams, so that the wireless telegraph installations on ships and shore stations are now for purposes of public communication joined to the general telegraph and cable system in most countries of the world. One of the subjects discussed at the Conference was that of Code Telegraphy, and the Lisbon Conference, while maintaining the privilege of using artificial words, has adopted measures designed to check the tendency shown in some codes to depart altogether from a reasonable standard of pronounceability.

Wireless Telegraphy.

During the year 39 licences (covering 58 installations) have been granted under the Wireless Telegraphy Acts. Of these, 37 were for experimental purposes and two for private business purposes. Since the end of the financial year the Postmaster-General has licensed installations at Liverpool for general public communication with ships, and installations at Heysham Harbour and Parkeston Quay for public communication with the packets of the Midland and Great Eastern Railway Co. respectively. Under the Order in Council of February 29th, 1908, licences have become necessary for radio-telegraphic installations on board British ships on the high seas. Licences are in preparation, and will shortly be issued to a considerable number of ships. The formal ratification of the Radio-Telegraphic Convention of 1906 has now been deposited; and the Government has also adhered to the Convention on behalf of the whole of the British Empire, except Newfoundland, which has decided not to adhere for the present, and the Orange River Colony, which, as an inland country, sees no necessity for adhesion. The Convention has been ratified by the great majority of the other signatory Powers, and came into operation on July 1st, 1908. The Marconi Co. has accepted the position, and decided to co-operate with the Government in giving effect to the Convention and the regulations annexed to it. The Post Office has continued during the year to collect and deliver the Marconi Co.'s telegrams to and from ships at sea under the arrangements settled in 1904. The total number of outward telegrams dealt with during the year was 1,725, as compared with 1,140 in 1906–7, and of inward telegrams 20,067, as compared with 15,853. Under the new arrangements, consequent on the coming into operation of the Convention, telegrams can now be forwarded (with the charges prepaid) from foreign countries for transmission to ships through the Marconi and other stations open for public traffic in this country, while telegrams can similarly be forwarded from this country for transmission through any foreign or colonial station so open. In connection with the Convention, a new Post Office station (which will have a range of about 250 miles) is being erected at Bolt Head, Devonshire, and will shortly be opened for public communication with ships. The Post Office stations for communication between Tobermory and Loch Boisdale (Marconi system), and between Hunstanton and Skegness (De Forest system), have continued to work satisfactorily during the year.

Telephones.

The number of telephone trunk wire centres open on March 31st, 1908, was 551, as compared with 533 on the corresponding date in 1907. During the year 342 new trunk circuits were provided, bringing the total number in use up to 2,385, containing about 80,000 miles of double wire. The capital expenditure on the purchase and development of the trunk wire system up to March 31st last amounted to £3,946,658, including an expenditure during the past year of £570,406. The total number of conversations which took place over the inland trunk wires during the year 1907–8 was 21,993,113, showing an increase of about 11 per cent. upon the number for the previous year. The gross revenue derived from the inland trunk service was £535,104, as against £480,658 in 1906–7, an increase of 11·3 per cent. The average value of each conversation was slightly more than in 1906–7, namely, 5·84d., instead of 5·82d. The receipts for the Continental Telephone Service for the year 1907–8 were £21,187, as against £20,166 for the previous year. The reduction of fees above 6d. for trunk calls made between 7 p.m. and 7 a.m., which took effect on October 1st, 1906, has resulted in a large increase in the number of calls. Not only has the loss of revenue been made good, but there has been an actual increase of about 12 per cent. In addition to 101 exchanges, 93 public call offices connected with the Post Office trunk line system were opened at places where the number of prospective subscribers was not sufficient to warrant the opening of an exchange. The total number of subscribers to the Post Office provincial telephone exchanges on March 31st, 1908 (excluding those at Glasgow and Brighton) was 11,579, as compared with 10,010 on March 31st, 1907; and the number of exchange telephones rented increased during the year from 13,232* to 15,785. This increase in the number of subscribers is the result of the normal development of the provincial telephone system of the Post Office. There has been a slight decrease in the number of the subscribers to the system taken over in 1906 from the Corporations of Glasgow and Brighton. On March 31st, 1908, the number of exchange telephones on the Glasgow system was 12,151, and the number on the Brighton system was 1,768. Steps are being taken to put the systems on a better footing.

On the question of telephone charges, it is pointed out that the present tariff is to some extent experimental; and further experience under the new conditions which will arise after 1911 will show whether its requires modification. Much interest has been shown during the year in the method adopted by the Post Office in recording calls made by subscribers. A committee of the London Chamber of Commerce, which made a thorough investigation of the system in use at the larger exchanges of the department, have satisfied themselves that the measures taken to secure the accuracy of the accounts rendered to subscribers are efficacious, and that the percentage of error, which is very small, is in favour of subscribers and not of the Post Office. There are now only two municipal telephone systems in the United Kingdom, viz., Hull and Portsmouth, and the number of telephones connected is 2,445, and 2,545 respectively. The sum received as rental in respect of private wires was £185,269, as compared with £183,008 for the preceding year. The number of telephones connected with the Post Office telephone system in the metropolitan area increased during the past year from 41,236 to 48,032, and additional subscribers are being connected at the rate of about 160 a week. The City Exchange, situated in the same premises as the Central Exchange, was opened during the year, and new exchanges have been established at Southall and Hornsey. It has also been found necessary to enlarge the London trunk exchange in order to provide accommodation for the additional circuits which, owing to the rapid development of the trunk system, will shortly be brought into use. There were 534 Post Office call offices open in the London area on March 31st last, and the number of calls made from call offices increased by nearly 55 per cent. during the past year. The length of the underground pipes which had been laid in the metropolitan area for telephone purposes up to March 31st last was 2,227 miles, 197 miles of which were laid during the year. Cables containing 383,070 miles of wire have been laid, including 95,862 miles rented by the National Telephone Co., and 43,548 miles provided for telegraphs, private wires, &c. The lines of the present subscribers and the junction lines connecting exchanges amount to 136,979 miles, and 102,357 miles of wire remain available for the future development of the telephone system. About 65,280 miles of telephone wire were laid by the Post Office in the metropolitan area during last year. The Postmaster-General has been considering whether a form of accounts could not be devised which would show more clearly the financial results of the telegraph and telephone services. He accordingly appointed a committee, on which the Treasury was represented, to report on the matter. The question is a very complicated one, and the committee has not yet finished its work; but, in accordance with their preliminary recommendation, the Estimates for 1908–9 have been presented to the House of Commons in such a way as to show separately the expenditure involved in the telegraph and telephone services. The amount of royalty received during the year from the National Telephone Co. was £269,789, and from other licensees £2,677. Having regard to the transfer of the National Telephone Co.'s system to the State at the end of 1911, arrangements are being made so far as practicable to prevent unnecessary duplication of plant during the period which still remains for the dual development of the telephone system in this country. The mileage of wire provided on rental terms by the Post Office for the company and by the company for the Post Office is constantly increasing. The company's Central Exchange at Cardiff is accommodated on Post Office premises, suitable rental being paid by the company for the facilities that are being afforded; and similar arrangements will be made in other cases.

Negotiations are also being carried on as to the development of the telephone service in those areas where competition has led to the duplication of wires and plant in general. The Post Office has to deal at present with 946,165 miles of wire distributed as follows:—Public telegraph wires, 274,183 miles; telephone wires, 482,394 miles; leased and other wires maintained by the Post Office, 189,588 miles. The new buildings for the central power station at Blackfriars are nearly completed, and the foundations for the engines, &c., are being laid.

* The figures for 1906-7 have been adjusted.

THE TRACKLESS TROLLEY SYSTEM

Report of the Manchester Committee

THE deputation appointed last July by the Manchester Corporation Tramways Committee to inspect the trackless trolley system in operation in certain towns in Germany has now presented its report. The deputation consisted of the chairman, deputy-chairman, the chairman of the Permanent Way Sub-Committee, and the general manager, Mr. J. M. McElroy, to whose courtesy we are indebted for a copy of the report.

The introductory portion deals with the general question of transit facilities for suburban districts, and considers the two following questions :—(*a*) How far is it desirable and advantageous to extend the tramway system into the suburban and thinly-populated outside districts, having due regard to the financial stability of the undertaking? and (*b*) when a reasonable limit of extension has been reached and some means of transit is desired beyond that limit, what is the best system to adopt? It is pointed out how the cost of operating tramways may be divided into running expenses, which remain approximately constant no matter how the total car mileage increases, and standing expenses, which *decrease* as the number of car miles per mile of track *increases*.

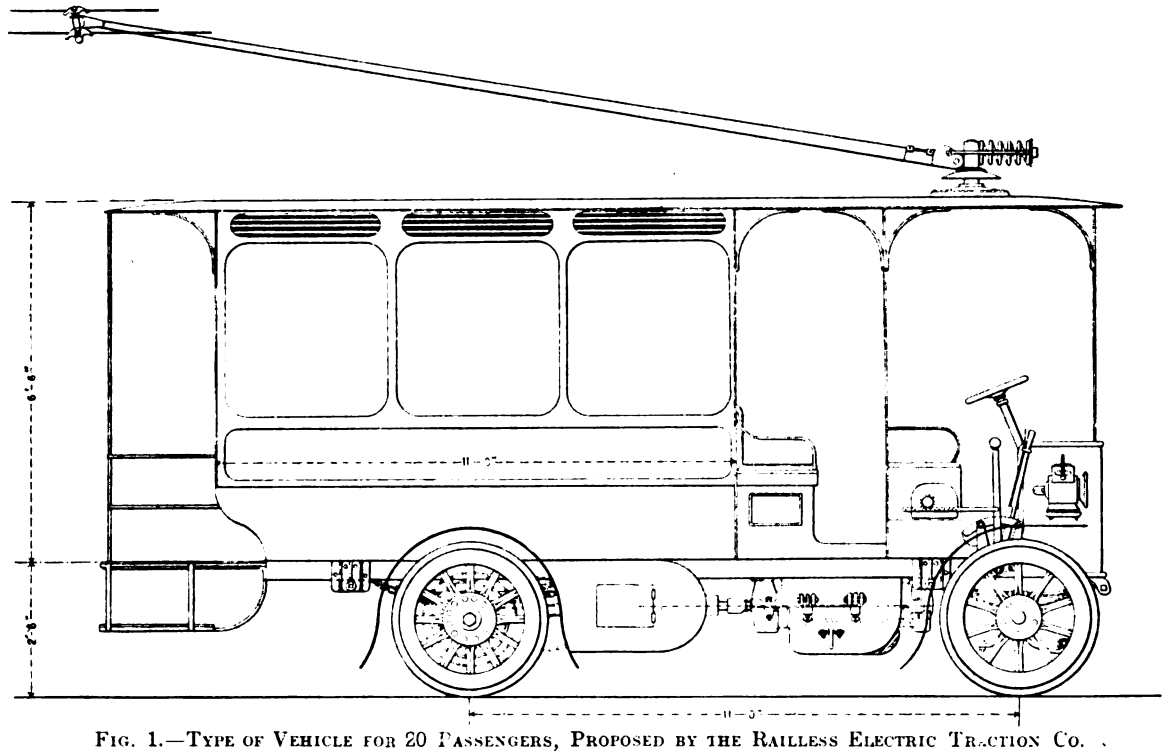

FIG. 1.—TYPE OF VEHICLE FOR 20 PASSENGERS, PROPOSED BY THE RAILLESS ELECTRIC TRACTION CO.

In illustration of this, a table is worked out to show how such expenses increase per car mile as the number of car miles per mile of track increases. Taking extreme cases, it is seen that, taking a figure of £380 per mile of single track, with a half-minute service the standing expenses are 0·138 pence per car mile only, whereas with a half-hour service they reach the sum of 8·26 pence per car mile. Taking the receipts at 11d. per car mile and the running expenses at 8·5d., *i.e.*, the surplus receipts at 2½d. per car mile, it would appear from the table that a nine-minutes' service is the economic limit. When dealing with the question of extension of a tramway system, however, the earnings and expenses of the extension must not be viewed as if such extension were a separate undertaking to be operated apart from the general tramway system. It must be remembered that, generally speaking, extensions tend to increase the value of the existing lines right from the centre of the city, and, therefore, the economic limit may be placed at a less frequent service than nine minutes. It may be safe to say that the economic limit would probably be reached on routes which would provide suitable revenue for a commencing service of, say, ten to fifteen minutes—provided that the length of the extension is not too great compared with the length of the existing line measured from the centre of the city.

The report then considers briefly the advantages of tramways for city traffic over mechanically propelled vehicles running independent of rails and independent of a central power station, as regards running expenses, ability to handle extra traffic at rush hours, and the overload capacity of the power station. In connection with this last point, it is pointed out that the work which a tramcar has to do varies considerably at different times of the day and at different periods of the year. In winter, when the track is in a bad condition, the tractive effort required reaches its highest point, but this may only occur for a few weeks. It is better and more economical to generate energy to provide for these "peak" loads in large quantities in a central power station than to provide each separate vehicle with an equipment for generating or for storing its own energy, which may only be called upon for its maximum output a few times a year, but which will have to be carried about by the cars all the year round. The motors in tramcars are capable of dealing with these exceptional loads whenever they occur, and, whilst the cheapness of generation in central stations is somewhat neutralised by having to transmit the energy through feeders to the trolley lines, yet on the whole the advantages of such stations for the working of large tramway systems are altogether too great for us to think of generation in small quantities in automobiles.

The only field for the motor 'bus is (*a*) in towns or cities where tramways are not permitted, or (*b*) in suburban districts where the traffic is not sufficiently great to warrant the laying down of tramway rails, and in the latter districts it will have a competitor in the trackless trolley. For providing means of transit beyond the economic tramway limit the trackless trolley system claims consideration. Briefly it may be said to employ vehicles operated by electric motors obtaining their energy from overhead trolley lines, which are in duplicate—positive and negative. The vehicles are, of course, subject to the usual disadvantage of all vehicles which run on the ordinary roadway instead of on rails, namely, that the tractive effort is greater, the difference between the two varying, of course, according to the condition of the road surface.

The report then describes the three trackless trolley systems inspected by the deputation in Germany. A number of particulars of the working of these lines have already been given in our columns in connection with the Dundee report upon the same subject (see ELECTRICAL ENGINEERING, July 30th, page 184). That connecting the townships of the Monheim and Langenfeld near Cologne, was opened for traffic in 1904, and is 2½ miles in length. The overhead equipment is of the bracket-arm type, and there are two trolley wires. The passenger car is a single-deck vehicle equipped with a 25-h.p. motor, with a front-axle drive by ordinary gear wheels. The car is able to carry 30 passengers, and its total weight is 4 tons 15 cwts. The front-axle weight is 3 tons 4 cwts., and the back-axle weight 1 ton 11 cwts. The two rigid trolley booms are 18 ft. long, and are so constructed as to be able to swing round in all directions, to allow the cars to move about 10 ft. from

Digitized by Google

the centre of the trolley line in a lateral direction. They are fitted with special contact shoes, about 5 in. long.

A more recently constructed line is that connecting the townships of Neuenahr, Ahrweiler, and Walporzheim. This was opened for traffic in 1906, and is a little over three miles in length.

The rolling stock is an improvement on that seen at Monheim, being much lighter in construction. The cars are single-deckers, and weigh 3 tons 2 cwt., as against 4 tons 15 cwt. in the earlier constructed line. The seating capacity is 20, but a number of passengers are allowed to stand. The cars are driven from the front axle by a 20-h.p. motor, and the front wheels are rubber tyred, the back ones steel tyred. Two-thirds of the weight is carried on the front wheels, and one-third on the back. There are two trolley booms on each car. These are fitted with sliding shoes for making the connection with the trolley lines, and they appear to give no trouble whatever in actual working. Lightly-constructed trailer cars, weighing 32 cwt., and fitted with rubber tyres, are run during the busy hours. The trailers are provided with seats for 19 passengers.

In the town of Mülhausen the most up-to-date system of the trackless trolley has been equipped. The overhead equipment consists of four trolley lines—two positives and two negatives. This does away with the necessity, when cars are passing, of one of them pulling off their trolleys, or providing special passing places. The cars are very similar to those at Ahrweiler, with the exception that they are somewhat lighter in construction (weighing only 54 cwts.) and have only one trolley boom. This is fitted with a special double pole connection for taking current from the trolley line.

The result of their inspection convinced the deputation that in the towns they visited the authorities had succeeded in getting what they set out to obtain, namely, a means of transit at the lowest possible operating costs—costs which the small revenue from the sparsely populated districts just about cover. The report continues :—It was interesting to see the improvements effected between the earlier and the later constructed lines, and the following is a brief summary of the system as developed to date :—A lightly-constructed overhead equipment with bracket-arms and four trolley lines fed with electrical energy carried by overhead cables. Specially designed overhead fittings for ensuring the safe working of the positive and negative lines.

Small single-deck cars equipped with single motors, with a front-axle drive. Controllers of the barrel type, with five power notches and four rheostatic brake notches. To minimise maintenance expenses, rubber tyres fitted on the front wheels only. Single trolley booms, with a double shoe attachment for taking current from the trolley lines. Trailer cars used during the busy hours.

The deputation consider that the system as seen by them in Germany will require some modification if it is to satisfactorily fulfil our English conditions. The type of 'bus would have to be materially altered. The front-axle drive which the Germans have adopted renders the steering gear somewhat ineffective. 'Buses driven from the back axle, with all four wheels rubber-tyred, would be necessary for our requirements.

The Railless Electric Traction Co., of London, have been giving consideration to the problem of providing a design of trolley car suitable for English conditions, and they are proposing a single-deck 20-passenger car, equipped with a single motor of the ordinary tramway type, driving the back axle through differential gear, counter shaft, and Renolds' silent chain. The report considers, however, that this size of car is too small to be commercially useful unless trailer cars are used. The general arrangement of the car proposed is shown in Fig. 1.

In reviewing the financial aspect of the question and making comparisons with petrol omnibuses, it is remarked that trackless trolleys would be cheaper to operate than internal combustion motors, mainly under two heads—general maintenance and depreciation. As regards reliability, the report says :—We must say that we have more faith in cars equipped with tramcar motors satisfactorily fulfilling this requirement than we have with internal combustion or steam engines as developed up to the present time; and a visit to London—where numbers of 'buses which have broken down on their journeys may be seen—tends to confirm this view. Other advantages of cars equipped with electric motors—as may be judged by travelling in an "electrobus" in London—are that there is less vibration, less noise, and no smell.

"Trackless trolley cars" act as pioneers for tramway extension—as a means of developing traffic before going to the expense of laying down rails. When the time arrives for the construction of tramways, the overhead equipment can, with slight modification, be adapted for tramcars, and the trackless trolley cars can be transferred to other routes.

The report concludes :—We have consulted the Board of Trade on the subject of the powers necessary for equipping and running the trackless trolley, and they advised that a suitable clause should be inserted in the Bill which we understand will be promoted by the Corporation in the next session of Parliament, and we recommend that this course be adopted. This will cause some delay, but, in one sense, that is an advantage : it will give us more opportunity of fully considering the type of car and car equipments best suited to our requirements, and it will give time to the Railless Traction Company, who are introducing the system into this country, to further develop their plans for the modification of the German system so as to bring it more into harmony with English conditions.

PETROL-ELECTRIC CARS ON THE HUNGARIAN RAILWAYS

For some time experiments have been in progress on the Arad-Csanad Railways in Hungary on the use of different forms of traction for independent coaches and short, light trains, which have resulted in the partial replacement for the lighter traffic of steam traction by cars driven by petrol engines with electric transmission. The experiments were commenced some six years ago with cars provided with equipments of 40 h.p., but, as will be seen below, some larger cars are now also employed, and the system has since been extended to such an extent that more than 1,800,000 train miles have been covered in this way, and the result of the improved conditions has more than doubled the receipts during the last five years.

Some particulars of this car and of the results of working are given in *Le Genie Civil*. The equipment of each motor coach comprises a petrol engine coupled directly to a continuous-current generator, which supplies current to ordinary series-wound traction motors geared to the driving axles and provided with apparatus for series parallel control. Batteries are not employed. The generating sets are contained in the driver's cab at one end of the vehicle, and the radiators for the engine-cooling water are placed on the roof. In the smaller cars a single driver has control of the equipment, but in the faster cars for longer distances a separate mechanician is carried. An illustration is given in the article referred to of a mixed train consisting of a Westinghouse 40 h.p. petrol electric car weighing 13 tons, drawing a 6·3-ton passenger trailer and an 8-ton goods van. This latter is constructed for a 6-ton load, so that with the full complement of 90 passengers and two attendants the train has a total weight of 40·8 tons. Passenger trains consisting of one motor coach and two trailers, seating in all 198 passengers and of a total weight of 35·26 tons, are also run. These vehicles are all four-wheeled, and the wheel base of the motor coaches is about 26 ft. The speed of this train is from 22 to 25 miles per hour. The 40-h.p. engines have four cylinders, 120 mm. diam. by 140 mm. stroke, with Simms-Bosch low-tension magneto ignition, and when towing one trailer at 22 m.p.h. consumes about 0·2 gallon of petrol per mile.

The larger cars already referred to are equipped with 80-h.p. engines, with six cylinders, each 135×155 mm., running at a normal speed of 900 r.p.m., with high-tension magneto ignition and driving 50-kw. generators. These cars weigh 16·3 tons, and in the standard three-car passenger train they draw two 6·3-ton trailers, giving a total weight, including 134 passengers, of 38·3 tons. They are capable of running under these conditions at from 34 to 38 miles per hour.

In a summary of the results of working it is stated that the average working expenses per ton kilometer from 1900 to 1906, for petrol electric traction, were from 1·4 to 1·533 heller (one heller is a hundredth part of the Austro-Hungarian krone, and is thus approximately equal to one-tenth of a penny), as against 0·74 to 0·894 heller for ordinary steam goods traffic and 1·094 to 1·129 heller for ordinary steam passenger traffic. As, however, the average receipts per ton mile for petrol electric traction were 3·007 heller, as against 1·580 for goods and 0·935 for passengers with steam working, the increased working cost has been amply justified. It is interesting to note that the dead weight of train per passenger with the system under consideration is 0·255 tons, as compared with 1·09 tons in the case of the ordinary steam trains formerly employed on the same lines.

There are at the present time 37 of these motor coaches in use on the Arad-Csanad Railways, including some of 30 h.p. capable of running about 20 miles per hour. Including experimental cars, 41 have been constructed and 13 more, of 40 h.p., are on order. The capital expenditure incidental to the adoption of the system has been 2,026,000 krone (about £84,500), and the result of its introduction has been to convert a loss of 180,000 krone of previous years on the passenger working to a profit of 24,000 krone in 1905 and 300,000 krone in 1907.

BODDY'S "METALIK"
METALLIC FILAMENT LAMPS.

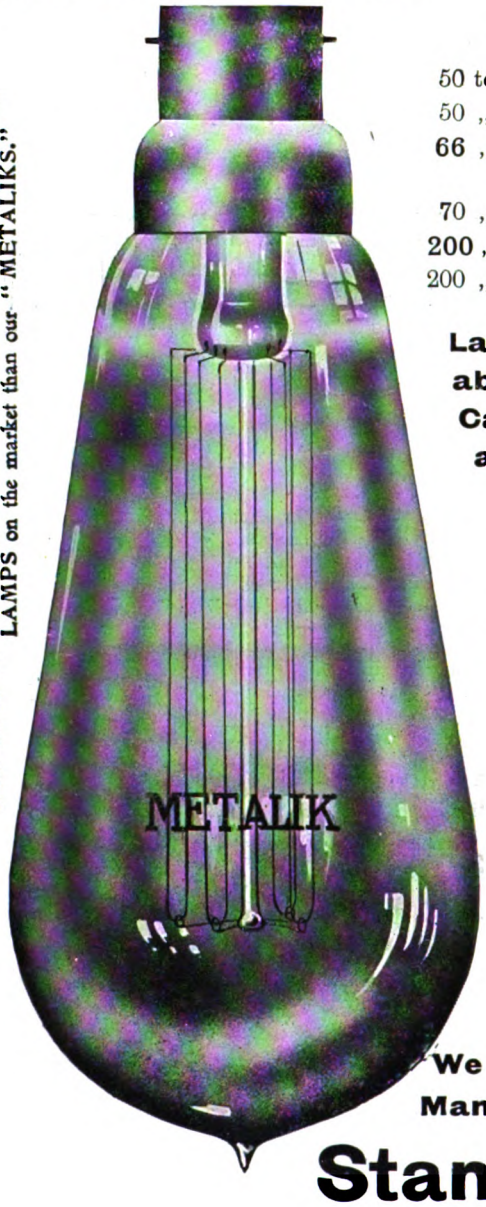
Since we **FIRST INTRODUCED** these lamps on to the English Market in 1907, they have **BECOME CELEBRATED** for

REMARKABLE SAVING OF CURRENT, LONG LIFE, SPLENDOUR OF LIGHT,

and have FIRMLY ESTABLISHED themselves in the CONFIDENCE OF LEADING AUTHORITIES, the demand now even Surpassing Expectations, and the lamps are being adopted more and more extensively by CORPORATIONS, PRINCIPAL CONTRACTORS, &c., throughout the United Kingdom.

Will burn in any position. **For Direct or Alternating Current.** **Efficiency: 1¼ watt per C.P.** **Average life over 1000 hours.**

There are no TOUGHER or more EFFICIENT METAL FILAMENT LAMPS on the market than our "METALIKS."



PRICES.

50 to 70 Volts,	16 C.P.	3/-	each.
50 „ 65 „	25 „	3/-	„
66 „ 130 „	25, 32 & 50 C.P.	4/-	„
70 „ 130 „	100 „	7/6	„
200 „ 250 „	50 „	6/-	„
200 „ 250 „	100 „	8/6	„

Large Stocks of the above Voltage and Candle Powers kept at all our Depots for Immediate delivery.

Our Filaments are made under a SPECIAL CHEMICAL process, by which they are of a tougher nature than any other METAL filament lamp of this type on the market, at the same time being quite as Highly Efficient.

Will BURN IN ANY POSITION. For Direct or Alternating Currents.

We are Exhibiting at Manchester Exhibition,

Stand No. 198.

We are in the POSITION to OFFER YOU the MOST FAVOURABLE TERMS, and SATISFACTION IS GUARANTEED.

THE

MANCHESTER ELECTRICAL EXHIBITION

OF

1908

OF all the trades and industries, electrical engineering is probably the one which can derive the greatest benefit from a properly organised exhibition, promoted by a representative committee of men, and recognised by the leading societies and institutions devoted to the interests of which it is the exponent. Any exhibition that is not merely a pleasure ground has for its object the improvement of some particular industry, either by bringing its products before the general public in an attractive manner, or by affording an opportunity for the various trading members of the industry and the allied industries to meet and inspect one another's wares, thus assisting the free buying and selling upon which business prosperity must necessarily depend.

An electrical exhibition, however, is beneficial in both these directions. The applications of electricity appeal directly to the public in a hundred ways. Progress is being made in electric lighting; and every householder and every business man is interested in ascertaining the very latest modifications in the science of illumination, the improvements that are constantly being made to promote economy and convenience, and the newest ideas in artistic designs of fittings. Electric heating and cooking appeals to the general public also, even if to a limited extent, as do likewise the advances that are being made in telephony and telegraphy. At the same time the supply station engineer and the wiring contractors desire to keep themselves informed of the various details of the new current-consuming devices, and the former must know of all the improvements that are being made in the design of generating machinery, its auxiliary plant, and distribution devices. The manufacturer of these things has to keep himself acquainted with the developments in machine tools and other labour-saving machines, and with the various mechanical parts that he uses but does not make himself. The mechanical engineer, again, and the manager of practically every manufacturing concern now take a keen interest in electric driving. All this is facilitated by an exhibition which brings together specimens of manufactures, machinery, and plant that are ordinarily distributed all over the country, and, what is equally important, an occasion which brings together and into more or less intimate contact the people who make, sell, and use them.

Apart also from its purely utilitarian aspects, an exhibition of this character has an educational value which must not be underrated. It has been said by a great man in one of those happy epigrammatic expressions that combine humour, terseness, and accuracy that a truly educated man knows something of everything and everything of something. The man of education is, in fact, a student all his life, and to him an industrial exhibition is a welcome means of extending his knowledge to those things of which he has still to learn "something."

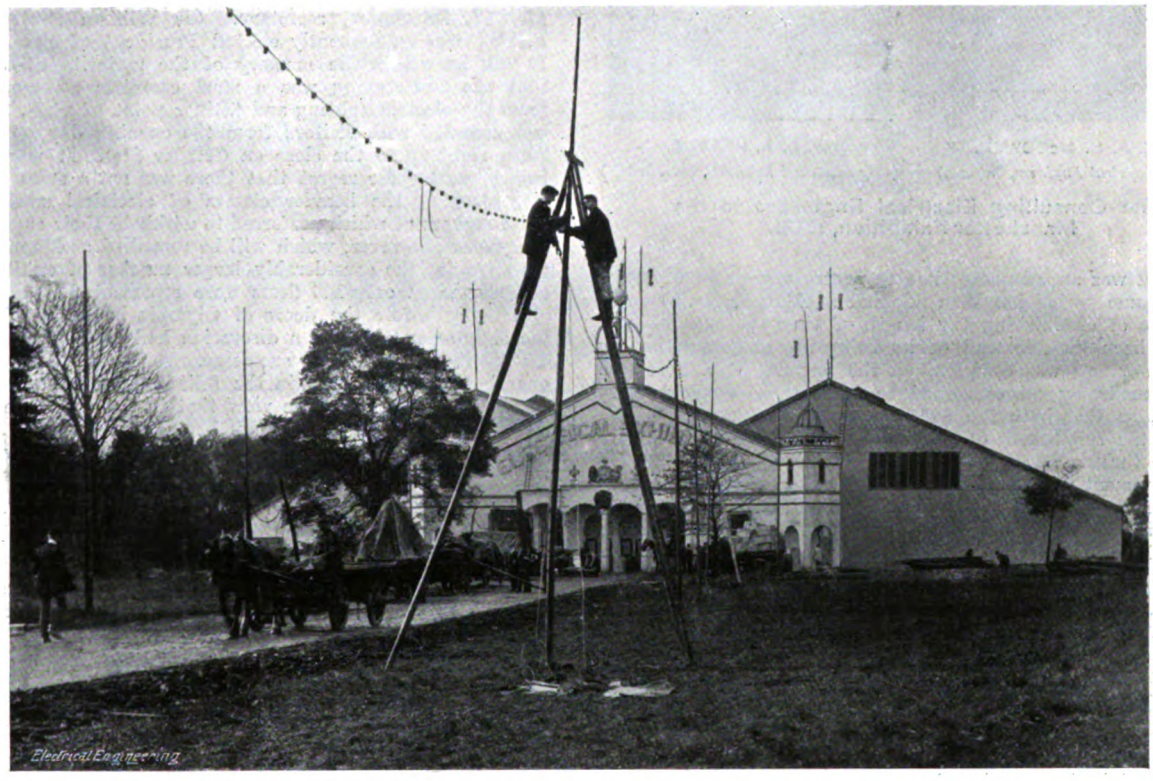

Fig. 1.—Erecting String of Lamps for Illuminating the Approach to the Exhibition.

It is, however, for the more selfish considerations that the electrical engineer is at present regarding the Manchester Exhibition. The electrical industry has suffered from a long period of depression, and it has probably been injured more than any other by the falling off in the general commercial activity of the country during the past few years. At the present moment a decided revival has taken place so far as electric lighting is concerned, fostered by the recent improvements in the incandescent lamp. It may confidently be anticipated that the present exhibition will assist in extending this revival to the other branches of electrical engineering.

SOME HISTORICAL NOTES

Leaving out of account the innumerable small local exhibitions which have been held in different parts of the country during the past few years—enterprises which have not always been regarded as a blessing by electrical manufacturers—the Manchester Exhibition of 1908 will be the fourth national electrical exhibition held in Great Britain during the 25 years' existence of the electrical industry here. The previous ones were held at the Crystal Palace in 1882 and 1892, and at Olympia in 1905. One sensible improvement has been made in the length of time such exhibitions are now allowed to run. The two Crystal Palace exhibitions were open for six months, whereas it was found that

The Consulting Electrical Engineers to the Manchester Exhibition, 1908.

one month was an adequate time to secure success at Olympia, and the same period has been adopted at Manchester. One of the results of diminishing the length of time the exhibition is open has been that, instead of its being the exception that an exhibitor's stand was complete on the opening day, a serious effort is made by all concerned to have their displays fully equipped, so that both the exhibitors and the public are able to derive the full benefit of the exhibition from the moment the doors are thrown open. In another direction, however, where an improvement might have been expected, one cannot but feel a sense of disappointment. When the remarkable growth of the industry is taken into account, it is a fact of more than ordinary interest that at the Crystal Palace Exhibition of 1882, inspired by the Paris Exhibition of the previous year, and mainly devoted as it was to electric lighting and telegraph work, the exhibitors numbered very few short of those at Manchester. They included a score of makers of magneto- and dynamo-electric machines; batteries and telephones were exhibited in similar quantities; and the remaining exhibits, making a total in the neighbourhood of 300, comprised, in approximately equal proportions, electric lamps and cables with a few of a miscellaneous character.

The Honorary Council of Advice at the first Crystal Palace Electrical Exhibition included Prof. Ayrton, Dr. John Hopkinson, Sir (then Mr.) William Crookes, Dr. Fleeming Jenkin, and Dr. C. W. Siemens, with Major Flood Page as general manager, and the exhibition, which was of more scientific than engineering interest, was honoured with visits by Royalty. The main feature of the Exhibition really was electric lighting. Weston and Brush arc lamps were shown, in addition to Edison and Swan incandescent lamps, to say nothing of the Jablockhoff candle, which was at the time in the height of its spluttering and dazzling ascendency. And it was in this year that the gas industry first gave evidence of its now notorious capacity for emulating both the methods and the practices of the electrical engineer. Stirred by the undoubted impression made upon the public mind by the advantages of electricity which were demonstrated at the Crystal Palace, a gas exhibition on similar lines was organised there in the following autumn.

Unlike the exhibition of 1882, which was a private speculation, that of ten years later was run on broader lines; the Crystal Palace Co. organised the exhibition, upon the suggestion of the London Chamber of Commerce, and gave the necessary space to exhibitors free of charge. A point of similarity, however, was that whereas in 1882 many foreign exhibits were transferred to London from the Paris Exhibition, which had been recently closed, in 1892 exhibits were transferred from the Frankfort Exhibition. Great strides had been made in electric lighting and in electrical machinery during the previous ten years, and consequently the exhibits were of a much more engineering character than in 1882, although the number of exhibitors was considerably less—about 200. The Advisory Committee in this year included many who took office in 1882, with the addition of Mr. S. Z. de Ferranti, Mr. J. E. H. Gordon, Mr. Gisbert Kapp, Mr. W. H. Preece, Major Cardew, Mr. Alex. Siemens, and others, who were assisted by a sub-committee appointed by the London Chamber of Commerce.

A long interval was allowed to elapse before the idea of another exhibition of a similar character was mooted. The suggestion eventually came early in 1905 from the National Electrical Manufacturers' Association in deference to the feelings of their members, who were at the time coming to the conclusion that the expense of sending machinery and apparatus to the many small local exhibitions, which had become quite a fashion, was not justified by the moderate results obtained. Electrical contractors and supply authorities gave their support to the proposal, which at once took definite form to the exclusion of a proposal, from other quarters, to hold a similar exhibition at the Crystal Palace. The Executive Committee, which included representatives of electrical manufacturers, municipalities, and supply companies, was presided over by Mr. E. Cunliffe Owen, C.M.G., of the Metropolitan Electric Supply Co., Mr. C. S. Northcote (Verity's, Ltd.) being elected deputy chairman, and Mr. W. Davenport, secretary. Sir William Preece, K.C.B., F.R.S., was subsequently elected President of the Exhibition. It will be within the memory of the majority of our readers that the undertaking was a most complete success, especially from the electric lighting and fittings point of view, and that it was crowded with visitors from the opening day on September 25th, right up to the close on October 21st. It was, nevertheless, a matter for regret that there was not a more representative show of the heavier classes of electrical machinery, the chief makers of which preferred to withhold their support. This is a defect, however, which will be remedied at Manchester, and accounts for the considerably larger number of exhibitors than in 1905, when only 140 firms were represented.

Actually before the doors of Olympia had been closed upon the Exhibition of 1905, a discussion had taken place as to the desirability of holding a successor. It was even suggested that one should be organised in the following year, but the Council of the Association held the view that it would not be politic to entertain the idea of holding another exhibition for at least three years. The matter was not discussed again seriously until the annual meeting of the National Electrical Manufacturers' Association, in April, 1907, when there was considerable difference of opinion about a suggestion emanating from the Manchester district, that an exhibition should be held there in the autumn of 1908. The general impression at this meeting was that whether the members of the National Electrical Manufacturers' Association acquiesced or not, the electrical engineering interests in Lan-

cashire intended to hold an exhibition, the case of which was particularly urged by Mr. Longbottom, of Electromotors, Ltd. By August last year, matters had advanced sufficiently for the announcement to be made that the Manchester and Salford Corporations had decided to hold an exhibition in their district, with their direct patronage and substantial support, in the autumn of 1908, and arrangements were then made for calling a meeting of corporation officials and supply companies' representatives in the North of England. Mr. S. L. Pearce and Mr. V. A. H. McCowen, chief electrical engineers to the Manchester and Salford Corporations, consented to act as Consulting Engineers to the scheme, and Mr. C. S. Northcote and Mr. Walter Davenport were appointed General Manager and Organising Secre-

tary respectively. The support of corporations and others was invited, and generously given in the form of donations, in exchange for which tickets of admission to the exhibition, printed specially for each authority, were supplied to the various contributors for free circulation in their respective areas. We believe that in Manchester alone some 50,000 tickets have been issued to picked consumers and potential consumers. It was also found necessary, in order to find additional working capital, to form a limited company to take over the necessary financial risk and guarantees. The profits arising from the exhibition, after the guarantors have been allotted their proper share, will be partly returned to exhibitors, and sums will also be allocated to the charities connected with the electrical industry, and, in consequence of the exhibition being held in the Manchester district, to a charitable institution nominated by the Manchester and Salford Corporations, and situated within their respective districts. A somewhat similar allocation of profits was made after the Olympia Exhibition. A preliminary canvass as to the probable support by the municipalities of the United Kingdom produced, as we have said, very satisfactory results, but a notable exception was the Glasgow Corporation. The plan and lists on the next three pages speak sufficiently for the canvass for exhibitors.

SITE AND BUILDINGS

The Manchester Corporation kindly consented to allow the use of a portion of Platt Fields Park, in the important residential district of Fallowfield, without charge, a site which, as will be seen from the map below, lies about 2½ miles along the Palatine Road tramway route. The building, erected by Messrs. Davenport Sons & Co., of Manchester, measures roughly 550 ft. long by 190 ft. wide. A feature of this is that there is practically no natural lighting, so that the interior will be lighted by arc lamps all day long.

The plan which we publish on page 4 shows at a glance the disposition of the various stands, &c., and in view of the fact that the buildings consist almost entirely of wood, it may be well to mention that elaborate fire precautions have been made.

A Corporation fire engine is stationed inside the building, firemen are on duty day and night, and water mains and standpipes have been erected at all the exit doors on one side of the building, with hose which will reach any distance. The river has also been dammed to preclude the possibility of the water supply giving out, whilst in addition there are to be a number of automatic fire alarm systems exhibited in working order. There should be no risk of fire from the electrical installations, either in the body of the hall or on the exhibitors' stands, as everything has been most carefully inspected by Mr. Pearce and his staff on behalf of the Manchester Corporation, who are supplying current, but smoking is allowed.

HOLDEN & BROOKE LTD.

"Parallel Flow" Oil Separators.
(Brooke's Patent.)

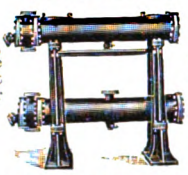
Highest Efficiency.
See List 127 E.

Without loss of Vacuum.

For freeing from oil or grease, exhaust or other steam as when condensing.

"High Velocity" Feed Water Heaters.
(Brooke's Patent.)

Heating Feed Water, &c., by Live or Exhaust Steam, or (as illustrated) by both.



Feed Water brought up to practically *Boiler Temperature* itself.

By our "High Velocity" System, far greater heat is obtained than by any other.
See List 156 E.

Leinert's Liquid Meters.
(Patent.)

Free from Complications.

Action and all parts visible.
See List 144 E.

Automatically measure and record (by actual weight) Water, Oils, and other Liquids. Accuracy not affected by changes in temperature and specific gravity of liquids dealt with.

Automatic Vacuum Dischargers.

See List 72 E.

For automatically draining and discharging water or other liquids from any Chamber under Vacuum, such as Oil Separators, Exhaust Steam Pipes, &c.

Steam Dryers.
(Brooke's Patent.)

See List 140 E.

No rivets.
No leaky seams.

The *only ones really reliable* with *high pressures* and *superheated steam.*

Injectors.

See List 137 E.

For all pressures and for *Hot Water.* Started and regulated by *one movement.*

Steam Traps.
(H. & B.'s Improved.)

See List 126 E.

Renewable Valve Seat.
Automatic Self-Grinding Valve.

Steady working with definite intermittent discharges.

Also Manufacturers of: PUMPS, COMPRESSORS, "PROTECTED SEAT" VALVES, EXHAUST HEADS, WATER LIFTERS, EJECTOR HEATERS, SIRIUS TRAPS, INJECTORS FOR ALL PURPOSES, &c., &c.

Sirius Works, West Gorton, MANCHESTER.

TRANSFORMERS

ANY SIZE

1 Watt to 1,000,000 Watts.

TEN YEARS AGO

we issued a catalogue in which occurs this paragraph—

"NON-AGEING IRON LOSS.—The ageing of iron in a transformer is due to a molecular change in the iron caused by the gradual heating and cooling, analogous to the well-known hardening effect on German Silver, Aluminium, &c., of gradual heating and cooling a number of times. This molecular change is less marked with iron having a fair percentage of one impurity than in perfectly pure iron. Several per cent. of Silicon produces one of the best irons for this purpose, and provided there are no other impurities this does not materially increase the hysteresis loss with extra care and time in annealing. (It is rather a combination of impurities than the actual percentage of any one impurity that increases the hysteresis loss.)"

Other makers are just beginning to see part of what to use in transformer iron—and what a fuss they make about it.

This is not all we know about transformers and we have not stood still in the interval.

MEETINGS OF SOCIETIES AND MISCELLANEOUS ARRANGEMENTS.

A new feature of the Exhibition will be the holding of meetings of various engineering societies in the Exhibition. Among those who have decided to do so are the Incorporated Municipal Electrical Association (October 16th and 17th), the Electrical Contractors' Association, and the Rugby Engineering Society. There will also be official visits made to the Exhibition by several municipal electricity committees.

An official visit will be paid by the I.M.E.A. on Friday, the 16th inst., and a Council meeting will be held on the following morning. The quarterly business meeting of the Electrical Contractors' Association will be held on the 16th inst., and on Saturday, the 17th inst., there will be a "propagandist" meeting, when all firms outside the Association will be asked to attend. This will be an open meeting, at which the aims and objects of the Association will be explained. The meeting will be at 11 a.m., and any electrical contractor not a member of the Association will be supplied with a ticket admitting to the Exhibition on application to the Hon. Sec. of the Manchester Branch, 10 and 16 Warren, Stockport, or to the Hon. Sec. of the Association, Haymarket Lane, Percy Street, Newcastle-on-Tyne.

A glance at the plan will at once show the position of the post office and telephone office inside the building, where full facilities are available. For the convenience of those visiting the Exhibition by motor-car, a garage has been erected, and full accommodation is afforded in the dining room, tea room, lounge and Welcome Club. Arrangements have also been made for the maintenance of a special taxi-cab rank immediately outside the Exhibition, which together with the very fine service of cars which the Corporation tramway department have available, should amply meet the needs of the visitors.

It had been intended to arrange for a series of more or less popular lectures, as was done at Olympia three years ago, but we understand that this idea has now been abandoned. Nor will there be any competitions in the way of electric cooking and heating, although there will be a number of such exhibits distributed throughout the building. We are also able to state that the management has abandoned the idea of installing a wireless telegraph outfit for maintaining communication with some town in the Manchester district. The possibility of this, as an attraction, had been announced, and it is evidence of the keenness of the Government department concerned that they should have communicated with the management a few days ago inquiring as to whether this idea was to be carried into effect.

THE "ELECTRICAL HOME."

An "Electrical Home," designed, built, decorated and furnished by Messrs. Goodall, Lamb and Heighway, of King Street, Manchester, occupies a central position in the Exhibition building. This house has been constructed bungalow style in one storey, of rough cast, painted white, with red tiled roof and overhanging door canopy surmounted with the heraldic device of former owners of Platt Hall. In a panel on one of the gables an inscription has been placed in French denoting that this is the little house with the good servants. Entry is gained by an ingenious "Sesame" door, which opens automatically when the visitor steps upon the mat and closes quietly when he steps off. An electric fire is fitted in the carved mantelpiece, and there is a central ceiling lantern with wall brackets. To the visitor's left will be found a spacious dining-room, oak panelled, in the Tudor manner, with arched beams. Adjoining the dining-room is the kitchen, in which every possible operation will be carried out by the aid of electricity. In the drawing-room a crystal chandelier and wall fittings have been installed, the design of the room being in the style of the later English Renaissance. Messrs. Drake & Gorham are responsible for the electrical lighting installation and the artistic fittings, and have on their stand a 25-volt oil engine plant which supplies the current. The General Electric Co., Ltd., have fitted the cooking apparatus, and will, we believe, give demonstrations in the kitchen, and Messrs. Elkington & Co., of London, supplied the silver.

THE EXHIBITORS' STANDS

Among the various exhibits that will attract particular interest is the miniature lamp factory, at which several skilled operators sent over specially from the Robertson Electric Lamp Works will be busy showing some of the processes in lamp manufacture. Electro Motors, Ltd., have some textile machinery in motion. Siemens Bros.' Dynamo Works show an electrical substitute for the "gassing" process in cotton manufacture. The British Thomson-Houston Co. exhibit a 1,000 kw. Curtis turbine and Messrs. Musgrave a 600 kw. Zoelly turbine with a glass cover on the wheel chamber so that the actual construction can be seen. The British Insulated and Helsby Cables have a wire-drawing machine working and also a section of 20,000-volt overhead transmission line. Messrs. Mawdsley's, Messrs. Drake & Gorham, and one or two other firms have put in complete 25-volt lighting plants for private house lighting with metal filament lamps. A new system of speed regulation for electrically-driven ring frames in cotton mills, shown by Messrs. Brown, Boveri & Co., will doubtless attract attention, as will also the new prepayment meter devices exhibited by Messrs. Reyrolle. The Post Office will have on view a historical collection of apparatus. Last, but not least, the great feature of the Exhibition will be metallic filament lamps.

These notes and the list below refer only to a very small proportion of the numerous exhibits of interest, detailed description of which will appear in our successive supplements.

To avoid any invidious distinctions, we have arranged the firms below in alphabetical order and not in order of magnitude.

The Aron Electricity Meter, Ltd.—Induction motor meters of various types. Clock meters. A complete system of clocks. Time switches. Hour counters for registering the total hours a lamp or lamps have been burning. Taximeters.

G. M. Boddy & Co.—Specimens of high- and low-voltage "Metalik" lamps, &c.

British Insulated & Helsby Cables, Ltd.—In addition to the exhibits mentioned above: Electric welders. Bates & Peard annealing furnace. House services, fuse boxes, and various switches, fuses, feeder pillar fittings, &c. The "Phantophone," an apparatus designed for simultaneous telephony and telegraphy, is exhibited for the first time altogether with a large collection of other telegraph apparatus.

British Westinghouse Electric & Manufacturing Co., Ltd.—Among this company's numerous exhibits is an automatic transformer cut-out. This consists of two auto-transformers, one to take the full load current, and one for light load. In the day-time the larger transformer is cut-out. Edgewise instruments with a V-shape scale so that readings can be taken from a distance at either end of the switchboard.

F. V. Brown & Co.—This firm is agent for Sanders Rehders & Co. (CO_2 recorders), Ross Hotchkiss & Co, (automatic "circulator," preservative compositions, &c.), and for the Daniels gas engine plant.

Crossley Bros., Ltd.—Suction gas plant. Horizontal gas engine driving a dynamo for emergency supply to the Exhibition. Arc light circuits.

D.P. Battery Co., Ltd.—Collection of storage cells, together with a specimen of plates, including the new "sponge" negative.

Drake & Gorham, Ltd.—A complete 25-volt lighting plant driven by an oil engine, and utilised for lighting the model home adjoining the stand. In the reception rooms of the home a selection of the firm's high-class fittings is shown. Jandus flame arc lamps. Motors and pumps. Switchgear. Metal filament lamps. Switches. Magnetic clutches.

Edison & Swan United Electric Light Co., Ltd.—Electric signs. Flame arc lamps. Fans. Switchgear. Measuring instruments. Lamps.

Electromotors, Ltd.—Motors with various gears. Steam and petrol sets. Textile machinery in actual operation.

The Electric & Ordnance Accessories Co., Ltd.—Dynamos and motors. Starters. Controllers. Miniature enclosed arc lamps. Flame arc lamps. Telephones. Heaters. Switchboards. The "Auto-meter," a combined speed indicator and speed recorder for use on motor-cars. Centrifugal fans.

Electrical Power Storage Co., Ltd.—Storage cells of various types. A large portion of the back of the stand is almost covered with 25-volt metal filament lamps, which are lighted from a battery of 14 cells.

The General Electric Co., Ltd.—This firm have a very large stand in the centre of the hall, and the searchlight erected on the top of it is particularly noticeable. Needless to say, Osram lamps and the fittings for them are an important feature of this exhibit.

Ferranti, Ltd.—A complete low-tension power switchboard built for their own works power station at Hollinwood.

Galloways, Ltd.—Galloway flue. Front end plate. Two superheaters. Boiler fittings.

E. Green & Son, Ltd.—Two models of Green's economisers and show case of sample tubes and specimen castings.

Hart Accumulator Co., Ltd.—A very large and representative collection of storage cells, including a battery of 30 11-plate cells, with capacity of 300 ampere hours, at the 12-hour rate. Practically every type of cell is represented from ignition batteries to large central station cells, and specimens of plates, separators, and accessories are shown.

Alfred Herbert, Ltd.—Machine tools.

The Hoffmann Manufacturing Co., Ltd.—Steel balls and ball bearings, and motors both vertical and horizontal fitted with these.

International Electric Co.—Orieco metal filament lamps. Meters. Telephone apparatus, &c.

Key Engineering Co., Ltd.—This firm have the Manchester agency of John I. Thornycroft & Co., Ltd. (motor vehicles), Cowans, Ltd. (switchgear), Ehrhardt & Sehmer (high-power gas engines. High-speed pumps.), Harris Patent Feed-Water Filter Co. (feed-water purifiers), Le "Carbone" (arc lamps), Otis Elevator Co. (elevators), Reavell & Co. (air compressors), Bat Electrical Co. (A.C. meters), Appleby's, Ltd. (lifting machinery).

Lancashire Dynamo & Motor Co., Ltd.—Motors and dynamos of various sorts, including a semi-enclosed backgeared motor. Flywheel equalising set for equalising peaks in a central station. Motor-driven winch and fan. Enclosed pipe ventilated variable-speed interpolar motor. In addition to these, motors made by the company are in use on twelve other stands.

Mawdsley's, Ltd.—"Zone" dynamos and motors, with their special winding. 200 : 25 volt motor generator for metal filament lamps, arranged in such a way as to show the increase in light given by this set and the metal filament lamps as compared with the 200-volt lamps supplied direct.

J. Musgrave & Sons, Ltd.—600-kw. Zoelly turbine driving a Siemens set, being a duplicate of the set described in our last issue, in connection with our description of the Falcon Mill, and destined for use at this mill. An electrically-driven barring gear, manufactured for use in conjunction with a 4,000 I.H.P. slow-speed vertical cross-compound engine for the Bankside station of the City of London Electric Light Co., Ltd. Cruse superheater.

Nalder Bros. & Thompson, Ltd.—Moving coil and moving iron instruments, including some quite new patterns. A large-sized illuminated dial instrument. Leakage indicators. A new tele-thermometer for use in cold-storage warehouses or cold-storage ships. Circuit-breakers. Jigger switch (the company's name for their limit indicator).

New Gutta Percha Co., Ltd.—Wires and cables insulated with Gutta Gentzsch and Pernax, as used by several railway companies, &c.

Oliver Arc Lamp, Ltd.—The Oriflamme arc lamp.

Pollock & MacNab, Ltd.—Machine tools.

Reyrolle & Co., Ltd.—An ironclad switchgear similar to that recently described in our columns, and also motor starters. The Merz-Price feeder protection system is shown under test, and some new prepayment devices, including the Highfield device used by the Metropolitan Electric Supply Co., Ltd., and the Hikeley prepayment hour meter, used by the Newcastle-upon-Tyne Electric Supply Co., and described in our current issue.

G. Richards & Co., Ltd.—Machine tools.

T. Robinson & Sons, Ltd.—Wood working machinery.

Siemens Bros. Dynamo Works, Ltd.—Loom motor fitted with spring belt tightening arrangements. Various motors. Specimens of switchgear. Meters. Arc lamps. Measuring instruments. Very many tantalum lamps.

Union Electric Co., Ltd. Motor-driven pumps and compressors. A compact paraffin motor and dynamo for private house installations. Numerous types of motors and arc lamps, measuring instruments, and switchgear.

PUBLISHERS' ANNOUNCEMENT

THE price of "Electrical Engineering" has been reduced to 1d.

The first number of "Electrical Engineering" was published on January 3rd, 1907, and the paper immediately took the leading position among the electrical newspapers. A thoroughly sound and practical technical paper, written and edited by men with long experience on the practical side of the electrical engineering industry, and illustrated with useful drawings to scale and well-printed photographs, was welcomed, and in spite of the comparatively high price of 6d., which it was necessary to charge for it, the paper scored an immediate success. The proprietors were, however, repeatedly urged to reduce the price in order to bring the paper within the reach of a wider circle of readers, and they decided from October 1st last to place "Electrical Engineering" on sale throughout the United Kingdom at the popular price of 1d. weekly (post free 1½d.). The leading features of the Paper remain unaltered. No change has been made in the Editorial Staff, the same high-class printing and illustrations are maintained, and the proprietors rely absolutely on the enormous increase of circulation which is assured, to recompense them for the sacrifice they are making in decreasing the price.

SUMMARY

THE Electrical Exhibition was opened to the public at Manchester on Saturday last, and inspected by the Press on that day. A formal "opening" ceremony took place on Monday, at which the Lord Mayor of Manchester expressed the opinion that electrical exhibitions should be held yearly in every large town. Some of the exhibits are described in the supplement published with this issue.

MR. J. B. HAMILTON, General Manager of the Leeds Corporation Tramways, has been retained by the Bournemouth Corporation to advise with regard to the administration and working of their tramway undertaking. (Page 514.)

THE electric generating station of the Letchworth Garden City is of particular interest on account of its small size and low cost. We give in this issue not only a description of the plant, but also some particulars of the capital cost of the undertaking and the working re-

Digitized by Google

sults. The station supplies six works with power, and a pumping plant is supplied separately by means of an overhead line. There is only a very small lighting load. The largest of the works is the book-binding and printing establishment of Messrs. W. H. Smith & Sons. We describe in full the method of automatic control adopted for some of the large printing machines. In the book-binding department a special form of ball-bearing is used, as it was absolutely necessary to ensure that no oil or grease should drop on the costly book covers. The total horse-power connected to the mains amounts to only 117 h.p. (Page 515.)

A short article describes an American installation in which a battery is used to equalise the load on an alternating-current system by means of a booster automatically controlled through a series transformer and auxiliary rotary converter. (Page 518.)

Illustrations are given of some of the very handsome fittings which have been installed in the new Holborn Borough Council Offices to be opened during the coming week. (Page 519.)

An electrically-propelled ferry-boat has been put into service recently on the Rhine. It is a twin-screw vessel, and is designed to carry 645 passengers. The electrical equipment comprises two 50 h.p. interpole series motors and a battery of 160 cells, with a total capacity of 335 ampere-hours on a one-hour discharge rating. The motors are controlled by levers in the navigating cabin where the instruments are placed. Two small motors are provided for operating the landing gangways, and an electrically-driven pump is also installed. Plug contacts for charging are provided at the landing-stage on one side of the river. (Page 520.)

Two of the fifty-seven accumulator railway cars ordered for the Prussian State Railways have been delivered, and are in service near Berlin. The design of the cars is quite different from that of the original cars in use at Mainz. Instead of placing the cells under the seats of the passengers' compartments they are now arranged in special shallow compartments in front of the driver's cabin. Each unit consists of two four-wheel cars, each car being equipped with one 80 h.p. motor and a battery of 84 cells. A run of over 60 miles can be made on one charge. (Page 518.)

The discussion on the Paper read by Mr. Merz on Power Supply at the Middlesbrough meeting of the Iron and Steel Institute turned largely on the utilisation of waste heat for power purposes, either in co-operation with a power company or for local needs. (Page 533.)

At 2.45 p.m. last Saturday the Lots Road generating station of the Underground Railways Co. of London had to be shut down for about two hours. The station supplies current to the District Railway, three tube railways, and (through a ten-mile trunk main) sections of the London United Tramways. The initial cause of the trouble was the burning out of a current transformer on a machine circuit. The transformer exploded, and this short-circuited the main oil-switch. The current surge, due to the earthing of one phase, overtaxed the static dischargers on the feeders, so that the 'bus-bars were earthed, and it was necessary to shut down the station. It took considerable time to clear up the earth connections on the 186 static discharge panels, and to make sure that it was safe to put 10,000 volts on the 'bus-bars again. (Page 524.)

The Elective Auditor at Cardiff, in his annual report, records with satisfaction that depreciation and renewal funds have now been created in connection with the electric light undertaking.—A committee appointed by the Erith District Council to consider the administrative expenditure of the various departments, recommends that the management of the electric lighting and tramways undertakings should be vested in one officer, instead of two, as at present.—Intercommunication with the municipal and company telephone systems in Hull is now complete.—Complaint is being made in Liverpool at the high charges for electricity.—An effort is still being made to secure compensation for the Mutual Telephone Syndicate in connection with its efforts to promote a telephone service in Manchester.—The Kensington Borough Council refuses to give its consent to the London County Council for the construction of tramways.—Particulars are given of some tests upon the water-purifying plant at the Summer Lane generating station of the Birmingham Corporation. (Pages 525–526.)

The London County Council require twelve water-tube boilers with mechanical stokers; the Salford Corporation require vertical steam and feed pumps; the Great Western Railway Company advertise for electrical stores, and tenders are invited for an electrical installation at the Twickenham Isolation Hospital. (Pages 526–528.)

The report of the Cleveland & Durham Electric Power Co. states that the connections to the company's system now amount to 20,105 h.p., against 9,172 h.p. last year. The net revenue for the year, after writing down preliminary expenses by £10,000, amounts to £5,142, in addition to £3,230 brought forward.—Some exception was taken at the meeting of Messrs. Willans & Robinson on Tuesday to the payment of the dividend upon the ordinary shares, but a resolution to this effect was lost.—There is a profit of £10,191 upon the business of Messrs. Scott & Mountain for the year to June 30th. (Page 530.)

In a specification published by the Patent Office on Thursday last K. Edgcumbe and C. I. Everett describe an improved pattern of motor-operated time-limit circuit-breaker, in which the timing-scale is independent of the current for which the switch is set. Among the other specifications published is one by the British Thomson-Houston Co. and F. H. Clough for a method of preventing chemical action in the armature slots of high-tension machines due to the high electric stress in the air space surrounding the conductors. A field system, consisting of poles with alternately series and shunt windings, is described in a specification by the Aarhus Dynamo & Elektromotor-fabrik. It is stated that this system of field winding is particularly suitable for crane and hoist motors. A specification by H. Bevis and A. E. Angold relates to an improved device for cutting out the shunt coils of arc-lamps when the carbons are burnt out, and another by J. E. and G. W. Glenister describes a proposed method of insulating electric wires with braided paper strip. A process for the manufacture of filaments of the rare earths for incandescing in the atmosphere is described in a specification by G. Michaud and E. Delasson. The filaments consist of an inner conducting core of carbon or tantalum and an outer radiating envelope of alumina and thoria. (Page 531.)

An International Conference on Electrical Units and Standards will be commenced on Monday at the rooms of the Royal Society, Burlington House, London. The main object of the conference is to obtain international agreement on the three electrical units, the ohm, the ampere, and the volt, so that the realisation of these units in all countries of the world shall be as near as possible identical. (Page 533.)

A recent article in an American contemporary by Messrs. H. C. Parker and W. O. Clark gives an interesting account of some of the experimental work in the development of the "Helion" lamp. The specific resistance of the Helion filament, which is formed of a preparation containing silicon on a carbon core, is stated to be several hundred times that of tungsten, and it is even possible to maintain the incandescence for long periods in the open air. (Page 534.)

Digitized by Google

The instantaneous success of the Electrical Exhibition in Manchester must be a matter for congratulation to every electrical manufacturer, whether he be an exhibitor or not. A large attendance of visitors who are taking an active and intelligent interest in the exhibits is encouraging the exhibitors to continue the adequate personal representation at their stands with which they have started, and there is no doubt that the business intercourse, both with the outside public and beween the firms within the Exhibition, will give a stimulus to the activity in the industry which has already shown signs of a revival during the past few weeks. There is another cause for satisfaction after a view of the exhibits. In spite of the fact that the keenness of competition has been a large factor in creating the depression from which the electrical industry has suffered during the past two years, and that cheap manufactures from abroad have joined in this competition, and in spite of the cut prices that have prevailed, necessitating the utmost economics in production, yet the general quality of the material exhibited, both as to workmanlike finish and solidity, shows all the characteristics which have long been the property of British-made goods. During the past few years many engineers have found it necessary to devote more of their energies to the selling department than to the designing office, but it is evident that this exigency of commerce has not caused any serious departure from the best principles of British engineering, and that our works remain well equipped in the technical departments. That the commercial side has now engineering knowledge and ability, as well as the technical side, is a clear gain, and so long as the selling department is not overstaffed or too lavish in its methods, the present system is a distinct improvement over the old one, in which there was a sharp barrier between the engineers and the men of commerce, the men on the one side of it lacking commercial experience entirely, while those on the other were lamentably ignorant of engineering methods and of the actual properties of the manufactures they had to sell.

Enthusiasm on the success of the exhibition must not tempt us to adopt the suggestion made by the Lord Mayor of Manchester and clamour for a yearly electrical exhibition in every town of importance. To do so would be to remove one of the chief causes of the success of the present exhibition, which is that sufficient time has elapsed since the last general exhibition of the same character to make it an "event" in the electrical industry. A yearly exhibition in every large town would mean that the same exhibits were carried about from place to place, and it would take the character of a travelling showroom. There is no doubt that the manufacturer must have a means of bringing his new patterns and new inventions before the buying public at frequent intervals, but a score of exhibitions yearly for this purpose in as many different towns would be a costly and inefficient way of carrying this out. It is for this purpose, however, that the technical Press of the country exists. We ourselves, and we believe our contemporaries also, are always ready to publish descriptions of any new electrical machinery, plant, or apparatus that may be introduced, and, speaking for ourselves, we know that our readers are as interested in learning of improvements in small detail as in our articles of more general character. This is a feature of our journal that we have always developed, and our editorial drawing office exists largely for assisting us in giving full effect to it. It may be argued that this does not give repeated publicity to the new article or pattern as would a series of exhibitions, but for this facilities are offered in the advertisement pages of our own and other technical papers at a far smaller expense and more effectively. The period of two or three years between exhibitions is, in our opinion, the right one, and one general exhibition for the whole electrical industry and for the whole country at this interval of time is best calculated to attain the desired object.

The mishap at the generating station of the Underground Electric Railways Co. of London, last Saturday, was a serious occurrence on account of the delays caused to thousands of passengers occasioned by the entire stoppage for about two hours of the whole of the important group of tube and other railways supplied from that power station. In considering the well-thought-out arrangements all over the system for the duplication of feeders, the provision for isolation of sub-stations, and so on, it has often been remarked that nothing but a complete breakdown at the Lots Road power-house could cause a serious interruption, and owing to the elaborate precautions which were taken in its design, even to the extent of dividing the whole power-house into duplicate and mutually independent halves, this has been regarded hitherto as a practical impossibility. That the peculiar circumstances, which led to a burn-out on a current transformer causing such a prolonged shut down of the station, are not likely to occur frequently is obvious from the official statement, which we publish in another column; but it is nevertheless a fact that no station, however complete its sectionalisation, is absolutely secure from temporary breakdown. One is naturally led to the question of how far it is advisable in matters of power supply to put all one's eggs in one basket, and the more so in view of the colossal single stations which have been featured in some of the proposed power schemes for London. It should be pointed out that in such a scheme as that of the Newcastle-upon-Tyne Electric Supply Co. there are several interconnected stations which could maintain, at any rate, a portion of the load in event of a complete shut down at Carville. One is tempted to ask whether some such interconnection for emergency purposes could not be arranged in London between the stations, say, of the Underground Electric Railway Companies of London at Chelsea, the Metropolitan Railway at Neasden, the London United Tramways at Chiswick, the Great Western Railway at Park Royal, and the London County Council Tramways at Greenwich, when the time comes for appointment of the London Traffic Board and the much-desired co-ordination of London traffic facilities. It may not be generally known that arrangements of this nature already exist in the case of some of the large London electric supply companies. The technical difficulties would be no greater than were got over by Mr. Merz in linking up the power companies of Northumberland and Durham.

While the small house transformer for enabling 25-volt metal filament lamps to be employed on 200-volt A.C. distributing networks is generally regarded as a more or less temporary expedient, it is clear that the 25-volt private lighting plant has come to stay. At the Electrical Exhibition in Manchester there are many examples of compact 25-volt country-house plants, in which a small generator is driven at high speed by a petrol or oil engine, making a very compact set, and the reduction in the number of cells of the battery increases the economy in first cost, and at the same time lessens considerably the floor space occupied and the labour involved in maintenance and supervision. The advent of the 25-volt systems, however, will necessitate some modification in house-wiring practice that must not be overlooked. Economies in insulating and protecting the conductors can, doubtless, be effected, but there are other directions in which departures from 200-volt practice must be made which may add somewhat to the cost of the wiring work. This cannot be too strongly urged at the present juncture, for the details of house-wiring are now left largely in the hands of the wiremen themselves, who simply work to conventional rules as to the number of lamps that may be connected on a cable of particular size and the number of lamps that can be allowed on a circuit from the distributing-board. Thus on 200 volts, ten 16-c.p. carbon filament lamps are the rule for a 3-ampere circuit from the distributing-board. At 25 volts, ten 16-c.p. metal filament lamps will require about 8 amperes, while if the same number of watts be taken for the circuit—viz., 600—the allowable current is no less than 24 amperes. It is probable that so large a current will only be taken in rare instances from a single way of a distributing-board, but even putting the limit at from 10 to 15 lamps per circuit, it is seen that considerably larger currents are used than at present. The percentage drop in volts over a bad contact is twenty-one times as great on a 25-volt 8-ampere circuit than over a 200-volt 3-ampere circuit, and the heat evolved is seven times as great. As also larger wires must be used for the heavier currents, difficulties will sometimes be introduced in "looping in," and the whole question of lamp-holders and fuse terminals must be examined. These are only some of the points that will arise on 25-volt installations, and the matter is certainly one which has now become of some importance.

We have to thank a large number of our readers for their congratulations and good wishes in connection with our new policy of reducing the price of Electrical Engineering from 6d. to 1d. So many letters have been received that it has been impossible to reply to each one individually. We assure our readers once more that no change has been made either in our editorial staff or management, and that the quality of the contents of the paper will be fully maintained.

Telegraph Traffic.—The cables between Paramaribo and Cayenne and between the Dardanelles and Constantinople, as well as between Arecife and Las Palmas having been repaired, the list of cables still broken is greatly reduced.—Owing to the hurricane in the Bahamas, the Nassau–Florida cable was interrupted on the 1st inst., but was repaired on the following day. Communication with Point-à-Pitre, Guadeloupe, was interrupted for a day. The landlines between Constantinople and Salonica and Smyrna are now in proper working order and clear. The cable of the Direct United States Cable Company is again in working order.

ARRANGEMENTS FOR THE WEEK

SATURDAY, OCTOBER 10th.

Birmingham & District Electric Club.

7.30 p.m. Smoking Concert at the Colonnade Hotel, New Street, Birmingham.

WEDNESDAY, OCTOBER 14th.

University College, London.

5 p.m. Lecture by Prof. J. A. Fleming, F.R.S., on "The Scientific Principles of Radiotelegraphy."

Association of Engineers-in-Charge.

8 p.m. Presidential Address by Mr. James Swinburne, F.R.S., on "Smoke," Mr. W. H. Patchell in the chair.

FRIDAY, OCTOBER 16th.

International Congress on Electrical Units and Standards.

Banquet by the Lord Mayor at the Mansion House to the delegates.

Incorporated Municipal Electrical Association.

Official visit to the Manchester Electrical Exhibition.

Electrical Contractors' Association.

Quarterly Business Meeting at the Manchester Electrical Exhibition.

SATURDAY, OCTOBER 17th.

Incorporated Municipal Electrical Association.

Council Meeting at the Manchester Electrical Exhibition.

Electrical Contractors' Association.

"Propagandist" Meeting at the Manchester Electrical Exhibition.

BOURNEMOUTH CORPORATION TRAMWAYS

Mr. J. B. HAMILTON, General Manager of the Leeds Corporation Tramways, has been called in by the Bournemouth Corporation to advise upon the administration and working of their tramways undertaking. This action on the part of the Corporation recalls the recent report of Major Pringle upon the Bournemouth tramways undertaking, in which he severely criticised the organisation of that department. He complained that there had not been a regular manager at Bournemouth, and that no one officer is responsible to the Corporation for the administration of the whole undertaking. He strongly advised the Corporation to make a change in the organisation by selecting, in open competition, a properly qualified general manager, and giving him control over the whole department. In reply to this it will be remembered that reports were furnished by the Borough Electrical Engineer and the Engineer and Traffic Manager, setting forth the duties of the various officials and claiming that the present system was efficient. It is stated that the present action of the Corporation is a direct result of Major Pringle's report.

Electro Harmonic Society.—The programme of the Friday concerts of the Electro Harmonic Society during the coming season is as follows:—Smoking concert, Friday, October 23rd; ladies' night, November 27th; smoking concert, December 18th; smoking concert, January 8th; ladies' night, February 2nd; smoking concert, March 26th. All the concerts will be held in the King's Hall, Holborn Restaurant, and commence at 8 p.m.

International Electrotechnical Commission.—The members of the International Electrotechnical Commission, which, it will be remembered, had its origin at the St. Louis Exhibition in 1905, and is a permanent international commission, will hold a meeting in Paris on October 14th, and a meeting also will be held in London on October 19th, in the evening of which the delegates will be invited to dinner as the guests of the "Dynamicables" at the Franco-British Exhibition. The meeting on the 19th inst. is mainly for the election of a new president, in succession to the late M. Mascart, and Prof. Elihu Thomson is to be nominated. It should be pointed out that these meetings are quite distinct from the International Conference on Electrical Units and Standards, which commences on Monday, at the invitation of the British Government, although the delegates in some cases are identical. The invitation to the "Dynamicables" dinner on the 19th inst., however, is extended to the delegates to both functions. An error in the date of the "Dynamicables" dinner appears on p. 533 of this issue, where it is given as October 14th. This date was originally fixed, but in consequence of the Paris meeting of the Electrotechnical Commission being on that day we are advised, as we go to press, of the change to the 19th inst.

Digitized by Google

ELECTRIC POWER AT LETCHWORTH GARDEN CITY

THE Letchworth Estate, which is the property of the First Garden City, Ltd., is situated between Hitchin and Cambridge on the Great Northern Railway, about 34 miles out of London. The total area of the estate is 3,818 acres, and the town proper, which covers about 1,000 acres, has a population of over 5,500. Ten factories have already started working, and others are in course of erection. The town itself consists of about 900 houses and 40 or more shops. At present the whole of the lighting of the town is by gas, which is supplied from the company's gasworks at 3s. per 1,000 cub. ft. for lighting and 2s. per 1,000 for power. There was, however, a considerable demand for electric power from some of the factories, and it was decided nearly two years ago to build a small power station. A gas-driven plant was settled on, and the tenders for the installation were called for in December, 1906, to a specification drawn up by the consulting engineers, Messrs. O'Gorman and Cozens-Hardy. With the exception of the buildings, the whole contract was placed with Messrs. Johnson & Phillips (Limited), Charlton, Kent, who sublet the gas engines and suction plants to the Campbell Gas Engine Co., and the battery of accumulators to the D.P. Battery Co.

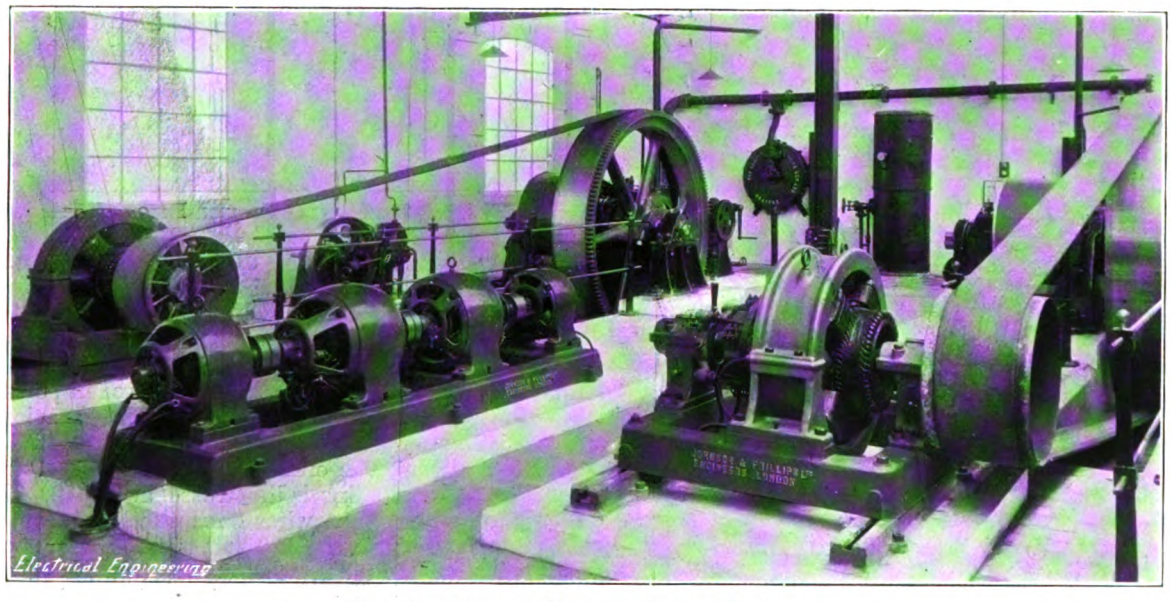

Fig. 1.—Interior View of Power Station.

The power station, an interior view of which is given in Fig. 1, contains two horizontal gas engines, each rated at 100 b.h.p., and two belt-driven continuous-current interpole generators, rated at 65 kw. at 500/550 volts, and running at 600 r.p.m. The booster balancer set consists of four machines coupled together on one bedplate. The balancing set, mounted in the middle, is capable of dealing with an out-of-balance current of 80 amps. when the boosters are not excited. The machines are cross compound wound, so that the E.M.F. on the overloaded side is automatically increased by one volt for every 10 amps. out-of-balance. The battery-charging boosters give 50 amps. at any voltage from 2–90. The three-wire switchboard consists of panels to control the two dynamos, balancers, boosters, battery, two feeders, and the usual B.O.T. earth panel. The battery is of the D.P. type, and consists of 260 cells, capable of giving a discharge of 30 amperes for 10 hours, with a final voltage of 1·85 per cell. The cells are in glass boxes, mounted on insulators and trays in the ordinary way. A milking booster, coupled to a ½ b.h.p. motor, is used in connection with this battery. The feeders and distributing cables are triple concentric paper-insulated and lead-covered, laid in wooden troughing on earthenware bridge pieces and covered by tiles. There is at present laid 320 yards of 0·125, 0·062, 0·125 sq. in. cable and 250 yards of 0·075, 0·0375, 0·075 sq. in. cable. Supply is given to the factories at either 500 volts or 250 volts for power, and 250 volts for lighting. Service boxes of the usual type were supplied, and in each factory a cut-out, switch, supply meter and maximum demand indicator were fixed. The engines are supplied with gas from two suction-gas plants, designed for working with anthracite fuel. There is also an alternative arrangement whereby the engines may be worked with town gas, and the pipework has been arranged so that the engines can be supplied with producer gas from either of the two suction plants. A geared barring arrangement is provided, so that one man is easily capable of turning the engine into a starting position; the engines are then started by means of compressed air contained in a mild steel receiver. A small gas-engine and single-acting compressor are provided to obtain the necessary store of air under a pressure of about 150 to 180 lb. per square inch. The air receiver is of large capacity, and has a sufficient store of air to start the engine several times in succession. The gas plants are of special design, so as to enable continuous runs to be made. They are provided with a water-motor fan for assistance in starting up; owing to the large amount of dust present, a water-motor fan is often better in such circumstances than an electrically-driven fan. Each gas plant is provided with two coke scrubbers of large capacity.

By the courtesy of the consulting engineers we are able to give the figures for the capital costs of the installation. These are as follows:—Buildings alone, £1,500; plant, £3,500; and mains, including an overhead line half a mile long, £500. This totals up to £5,000, or about £36 per kw., excluding mains, and £5,500, or about £40 per kw., including mains. At present the total connected horse-power amounts to only 117 h.p., but this figure will soon be increased. There are about 600 lamps connected, equivalent to 900 8 c.p. carbon lamps. The maximum load on the station amounts to about 65 kw. There is no night load, and the engines are not running Saturday after-

Digitized by Google

noons or Sundays, unless it is required to charge the batteries. At present it is only necessary to give the batteries a full charge once a week. The load is almost entirely power, and generally fluctuates between 30 and 60 kw.

The following results of working for the month of August are of interest:—The coal consumption per unit generated works out at a little under 2 lb.; the gas taken from the town mains for running the compressor amounted to 1,400 cubic feet; the number of units unaccounted for were 16 per cent. of the number generated; and the total number of units generated was 7,520. The works costs are as follows:—

Salaries and wages	0·511d. per unit
Coal (at 38s. per ton delivered)	0·387d. ,,
Water	0·060d. ,,
Oil, stores, and gas for compressor	0·056d. ,,
Total works cost, excluding capital charges	1·014d. ,,

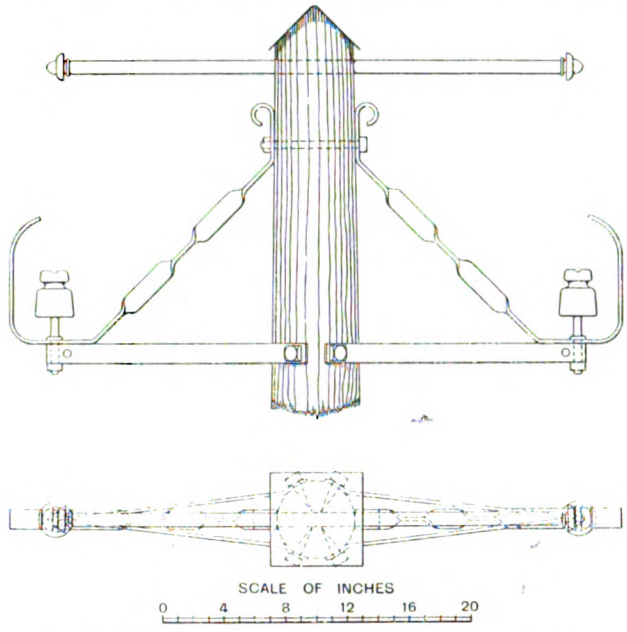

Fig. 2.—500-volt Overhead Pole Line Construction.

Considering the very small output of the station these results are very satisfactory. The maximum demand system of charging has been adopted; the rates for lighting are 8d. and 1½d., and for power 3d. and 1d., the higher figure being for the first 100 hours per quarter for all four quarters of the year. The average price obtained works out at 4d. per unit for lighting and 1·7d. per unit for power.

The overhead line mentioned above runs from the station across the fields to a pumping station half a mile away. Instead of crossing the road, the first 50

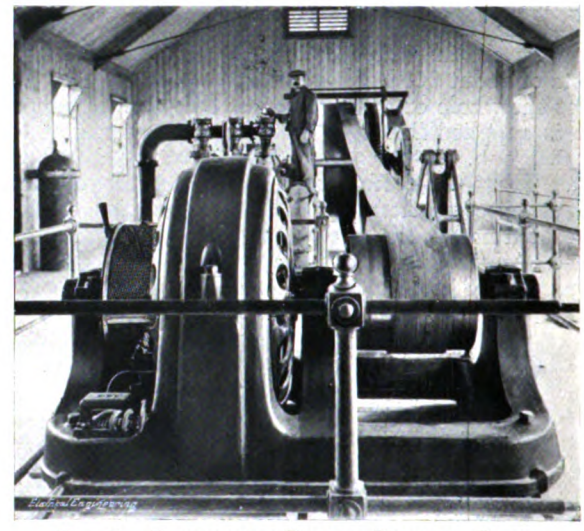

Fig. 3.—Electrically-Driven Pumping Plant.

yards of this line is v.i.r. cable drawn into cast-iron pipe. The first 170 yards of the overhead line consists of two wires of 19/14 stranded copper and the remaining 330 yards is 7/12 stranded copper. The wires are supported on porcelain insulators fixed to galvanised iron brackets, which, in turn, are fixed to wooden poles sunk into the chalk sub-soil. At the angles a special form of bracket and a heavier and stronger pattern of insulator is used. The ordinary form of bracket for the poles in a straight line is illustrated in Fig. 2. Where telegraph or telephone wires cross the line a protecting cradle is fixed above the 500-volt wires; the support for this is shown in Fig. 2. The contractors for this overhead line were Messrs. Christy Bros. & Co., of

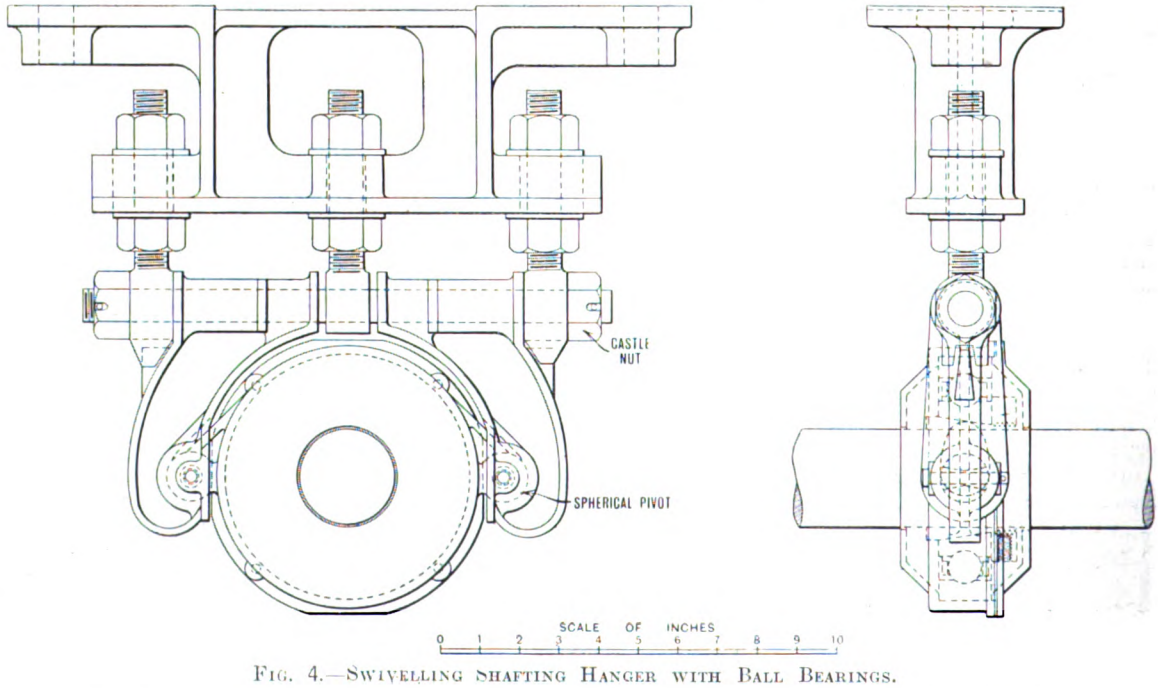

Fig. 4.—Swivelling Shafting Hanger with Ball Bearings.

Chelmsford. The drop along the whole line with a load of 45 amps. is 40 volts; most of this drop is in the smaller cable however; the first portion of the

Digitized by Google

line is designed for a much heavier load, there being a suitable site for one or more factories at the end of the first portion. At the pumping station at the end of the line there are two wells sunk into the chalk to a depth of 210 ft. The water is drawn up by means of an Ashley ram pump in each case which delivers into a tank; from the tank the water is pumped up into the

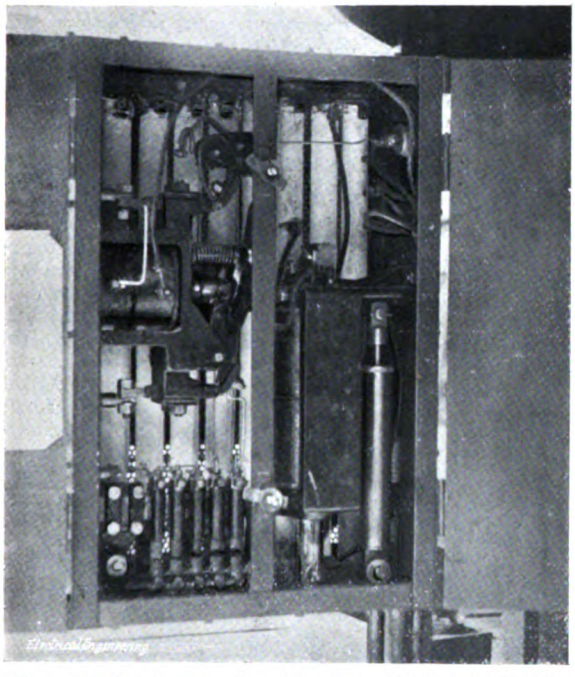

Fig. 5.—Automatic Starter for Printing Press.

main reservoir, on a hill some distance away, by means of a Glenfield and Kennedy three-throw pump which is coupled to the ram pump. In one case the complete set is belt driven by a 30 h.p. E.C.C. motor. The other set is at present driven by a gas engine. The electrically-driven set is illustrated in Fig. 3. Each set is capable of dealing with 11,150 gallons of water per hour.

The Letchworth power station has at present only seven customers; these include two printing works, the pumping station, a saw-mill, and a tapestry works. The largest consumers are the bookbinding and printing works of Messrs. W. H. Smith & Sons. In our issue of September 17th last we described the lighting and power arrangements at the London premises of this well-known firm. At the Letchworth works all the bookbinding and a large amount of printing is done. The works at Letchworth consist of two buildings, the one devoted almost entirely to bookbinding and the other, known as the Arden Press, to printing. In the former building there are in all six motors, aggregating 20 h.p. All the machines are belt driven, and it is worthy of notice that in many cases the machine or shafting pulley is arranged vertically above the motor pulley. Chrome leather belts are used, and this arrangement has caused no trouble whatsoever. "Brookhirst" starters with worm and wheel gear for ensuring slow starting are provided. A large number of small machines are driven through shafting by a single motor, and this shafting has, of course, several bearings, supported by brackets from the roof. As a number of expensively bound books are always in the works, it is essential that no oil or grease should drop from these bearings. To satisfy this condition the form of ball-bearing, illustrated in Fig. 4, was adopted. Only a minute amount of grease is required with such a bearing, and besides obtaining smooth and economical running the absence of falling drops of oil or grease is ensured. These hangers were supplied by Messrs. Mair, Sykes & Ferguson, of Kettering, and are constructed so as to allow for both angular and axial movements of the shafting. One bearing on each shaft has a device attached to it for the purpose of holding the shaft on end and yet still allow freedom to swivel. When swivelling takes place the levers shown in the figure move differentially; they move together when allowing for end motion. The ball bearings are of the well-known Hoffman type. There is nothing unusual about the installation besides the above. The lighting of this works is by carbon filament lamps; the wiring of the lighting and power circuits was carried out by Mann, Egerton & Co., Ltd., of Norwich. It is interesting to note that the average charge for power for these works for the last quarter worked out at 1⅝d. per unit.

In the Arden Press building there are in all 12 motors, aggregating 33 h.p. Six of the motors drive large printing machines, fitted with tumbler-switch automatic control. Two of these are controlled by the automatic gear manufactured by the Adams Manufacturing Co., and described in our issue of September 17th in connection with Messrs. W. H. Smith & Sons' London premises. The motors were manufactured by Electromotors, Ltd. The other four machines are belt driven from Johnson-Lundell motors, and are controlled by means of an automatic gear, which is a special development of the standard lift control gear of Messrs. A. W. Penrose & Co., adapted for use with printing machines. A photograph of one of these starters is given in Fig. 5, and a diagrammatic sketch, illustrating the mode of working is shown in Fig. 6. In this diagram A is the controlling tumbler switch, situated on the machine itself; on closing this switch a circuit is made from the positive main through the solenoid of the main switch, the low resistance C, the contacts D (only if the lever is in the starting position as shown), and the contact pieces E and F to the

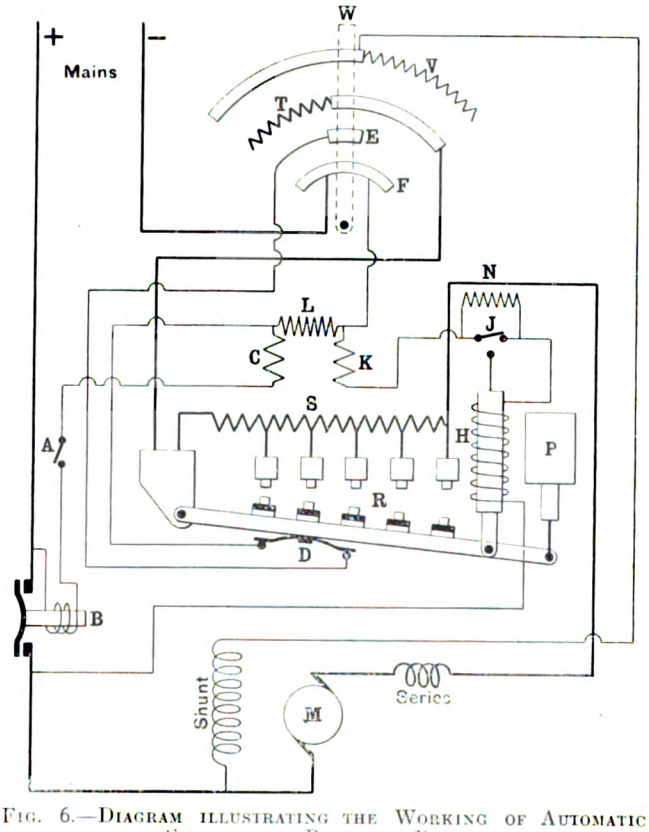

Fig. 6.—Diagram illustrating the Working of Automatic Starter for Printing Press.

negative main. It will be noted that the arm W of the speed regulator must be in the position of maximum shunt field in order to bridge across the contact pieces E and F. If the arm is not in this position there is a circuit through the high resistance L to F; this per-

Digitized by Google

mits a current to flow, which, although strong enough to hold up the plunger B, is not strong enough to raise it and close the switch when it is open. When running this reduced solenoid current flows through C and L, the other circuit being open at both D and E. The main switch having closed, the circuit through this to the starter solenoid H and from there through the low resistance K to the negative main is made. As the starting lever rises the starting resistance S is cut out gradually by means of the carbon contacts R, which make contact in succession. The movement of the lever is controlled by means of the dash-pot P. When all the resistance is cut out the plunger of the starting solenoid opens the switch J; this puts the resistance N in circuit and cuts down the current to an amount sufficient to hold up the plunger only. The motor will now be running at normal speed with full field, and the current in both control circuits will be cut down to the minimum amount on account of the opening of the switches D and J respectively. In order to raise the speed of the motor, the arm W is moved to the right, thus inserting a portion of the resistance V in the shunt-field circuit; to lower the speed the arm is moved to the left, and a portion of the resistance T is put in series with the armature. To stop the machine the tumbler-switch A is thrown; this breaks the main switch solenoid circuit and opens the main circuit. As mentioned above, it is impossible to start the motor again until the speed regulator arm is returned to the middle position. A machine fitted with one of these starters is illustrated in Fig. 7. The tumbler switch is just visible almost vertically above the jockey pulley. This latter is fixed on a pivoted lever, which is attached to the frame by means of a spring, and thus holds the belt in tension and gives a larger contact area on both pulleys. The average charge for power for these works amounted to rather less than 1⅛d. per unit last quarter.

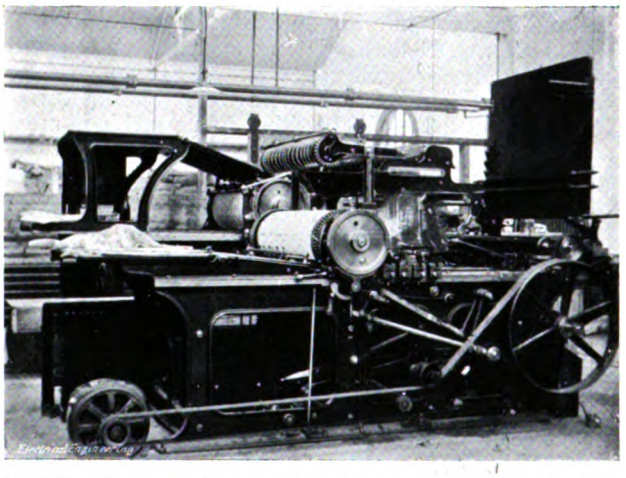

Fig. 7.—Printing Press with Automatic Tumbler-Switch Control.

The second printing works is that of the Garden City Press Ltd. In this works there are two large printing machines geared to electric motors of 4 and 2 h.p. respectively; these are provided with Adams controlling gear. There are in all five motors, with a total horse-power of 17 h.p. At the saw-mills there is a 15 h.p. motor, and at the tapestry works a 2 h.p. motor. These, together with the 20 h.p. motor at the pumping station, bring up the total to 117 h.p. connected.

We are indebted to the firms mentioned for permission to inspect their works, and to Mr. A. W. E. Bullmore, the chief engineer to First Garden City, Ltd., for facilities afforded. Our thanks are also due to Messrs. O'Gorman & Cozens-Hardy, the consulting engineers.

A STORAGE BATTERY FOR REGULATION OF AN ALTERNATING LOAD

A DESCRIPTION of a battery installation for dealing with load variations on an alternating current system at an American power-house at Elmira, N.Y., is described in the *Electrical Review* (New York). The station has a load consisting of traction, power, and lighting. The entire fluctuating load is concentrated on an auxiliary set of bus-bars, the direct-current load being supplied through rotary converters, and treated so far as the regulation control was concerned as an alternating-current load. The battery installed consists of 280 cells of the Gould Storage Battery Co.'s make, having a discharge capacity of 560 amperes for one hour (ultimate capacity when the tanks are filled of 880 amperes for one hour), and capable of delivering momentary discharges up to three times the one-hour rate.

This battery in series with a 140-volt, 600-1,700-ampere booster driven by a 2,200-volt, three-phase, sixty-cycle induction motor, is connected across the direct-current railway bars, the same being supplied from the variable-load alternating-current bars by transformers, and a 750-kilowatt, 600-volt rotary converter. The field of this booster is automatically controlled by an exciter set. The usual regulating field-winding of the booster is replaced by a fine-wire winding controlled by a Gould regulating converter. This converter, which is driven by a small synchronous motor, is fed by a series transformer placed in circuit with the feeder supplying the variable load bus-bars, and delivers a direct-current output proportional to the true energy component of the current in the alternating circuit. An auxiliary series transformer with sectional secondary taps brought to a compensator head mounted on the switchboard is connected in the alternating-current leads of the regulating converter, thus providing means for changing the effective ratio of the series transformer and permitting the average load supplied to the variable-load bus to be changed at will. An increased demand for energy on the variable-load bus causes an increased output from the series transformer in phase with the voltage wave, thus increasing the direct-current output from the regulating converter and causing the battery to discharge, or to charge when the demand on the bus-bar falls below the average for which the adjustable transformer is set. As long as the demand on the direct-current feeders is greater than the battery discharge, the action of the battery is to relieve the station of a portion of the direct-current load, the battery discharging directly to the direct-current feeders and reducing the load on the rotary. When the load conditions are such that the battery discharge is greater than the direct-current demand on the station, the battery first supplies the entire direct-current load and then inverts the surplus through the rotary and transformers to the 2,200-volt, three-phase bus. The ordinary peaks on the station, however, do not often require this actual inversion.

Great Eastern Railway Co.'s Electrical Employees.—Following on the reductions which have recently been made in various other departments, the directors of the Great Eastern Railway Co. have announced a revision in the terms of employment in the electrical engineers' department. From January 1st, 1909, the following alterations will take effect:—Linemen to be reduced 2s. per week for all men having over 34s. per week, exclusive of expenses, 1s. for all men below; assistant linemen to be reduced 1s. per week; foremen to be reduced 4d. per day; wiremen to be reduced 3d. per day; labourers to be reduced 2d. per day; rail contract men and battery men to be reduced 1s. per week; carpenters, smiths, fitters, &c., to be reduced 1s. per week; the arrangement of allowing pay for holidays will be discontinued.

Liability for Tramway Track Repair in London.—At the West London Police Court on Monday, the Hammersmith Borough Council sued the London United Tramways Co., Ltd., for failing to maintain and keep in proper repair the rails and roadway in respect thereof in Uxbridge Road, Goldhawk Road, and King Street. It was claimed on behalf of the Borough Council that the Tramway Company is bound under its Acts to keep the lines in proper repair, failing which the Council has authority to enforce a penalty of £5 per day during which the repairs are not carried out, through a Court of common jurisdiction. An objection was taken on behalf of the company, however, that under Section 33 of the Tramways Act of 1870, jurisdiction was removed from a Court of Summary Jurisdiction and placed in the hands of a Board of Trade arbitrator. The penalty of £5 per day could only be enforced after an award by the arbitrator. The company has already applied to the Board of Trade for an arbitrator. The magistrate, however, held that he had jurisdiction, but the case being a difficult and important one, he adjourned the summonses *sine die* for the decision of a higher court to be taken.

FITTINGS AT THE NEW HOLBORN BOROUGH COUNCIL OFFICES

THE accompanying illustrations represent some very artistic and effective fittings which have been supplied by Messrs. J. W. Singer & Sons, Ltd., of Frome, Somerset, to the new Holborn Borough Council offices, where they are placed in the Council Chamber. The building is electrically lighted throughout, and extensive use is made of metal filament lamps. The whole electrical installation, which is very complete, was carried out by Messrs. Foote & Milne, of Victoria Street, and the architects to the building, which is to be opened during the coming week by the Lord Mayor, are Messrs. Warwick & Hall.

AN ELECTRIC FERRY-BOAT ON THE RHINE

By Dr. M. Erb

AN electric ferry-boat has been put into service on the Rhine this year to provide a regular service between Godesberg and Niederdollendorf. It is the first of its type to be employed on this river, and is the largest electrically-propelled boat in use on any German waters. The boat, an illustration of which is given in Fig. 1, is licensed to carry 645 persons, and

Fig. 1.—Electrically-Propelled Ferry-Boat on the Rhine.

there is sufficient free space on the wooden fore-deck to accommodate four completely harnessed vehicles. The following are the leading dimensions of the boat, which draws about 2 ft. 9½ in. of water:—Length between perpendiculars, 98 ft. 5 in.; greatest breadth, 26 ft. 3 in.; height to main iron deck, 6 ft. 2¾ in.; length of free deck, 49 ft. 2½ in.; breadth of deck, 31 ft. 2 in.; and height to top of wooden deck, 7 ft. 6½ in.

The hulk is constructed of Siemens-Martin steel, and contains the following compartments between bow and stern:—Collision space; cabin with bunks for the crew; battery-room; and store-room. Behind the fore-deck, which is used for the accommodation of horse-drawn and motor vehicles, the deck is raised a few steps, and on this higher part a deck-house, consisting of a wooden framework covered with sheet steel, is erected. The back part of the deck-house is fitted as a saloon, while the front part contains the navigating cabin, toilet compartments, and the entrance to the motor-room. The surrounding deck is provided with seating accommodation, and is covered by a canopy projecting from the roof of the deck-house. From the navigating cabin, which is built of teak, and contains the helm, the motor-starting switches, and measuring instruments, a free outlook in all directions is obtained. Access to it is provided by means of a stairway on either side of the deck-house, as may be seen from Fig. 1. A longitudinal section of the boat, showing the arrangement and relative proportions of these compartments, is given in Fig. 2. Electrically-operated hinged landing gangways, 26 ft. 3 in. by 2 ft. 11½ in., constructed of iron and boarded with pitch-pine, are attached to either side of the boat. When raised they form a continuation of the guard railing encircling the deck. These gangways and the motors for operating them can be seen in one of the transverse sections given in Fig. 2.

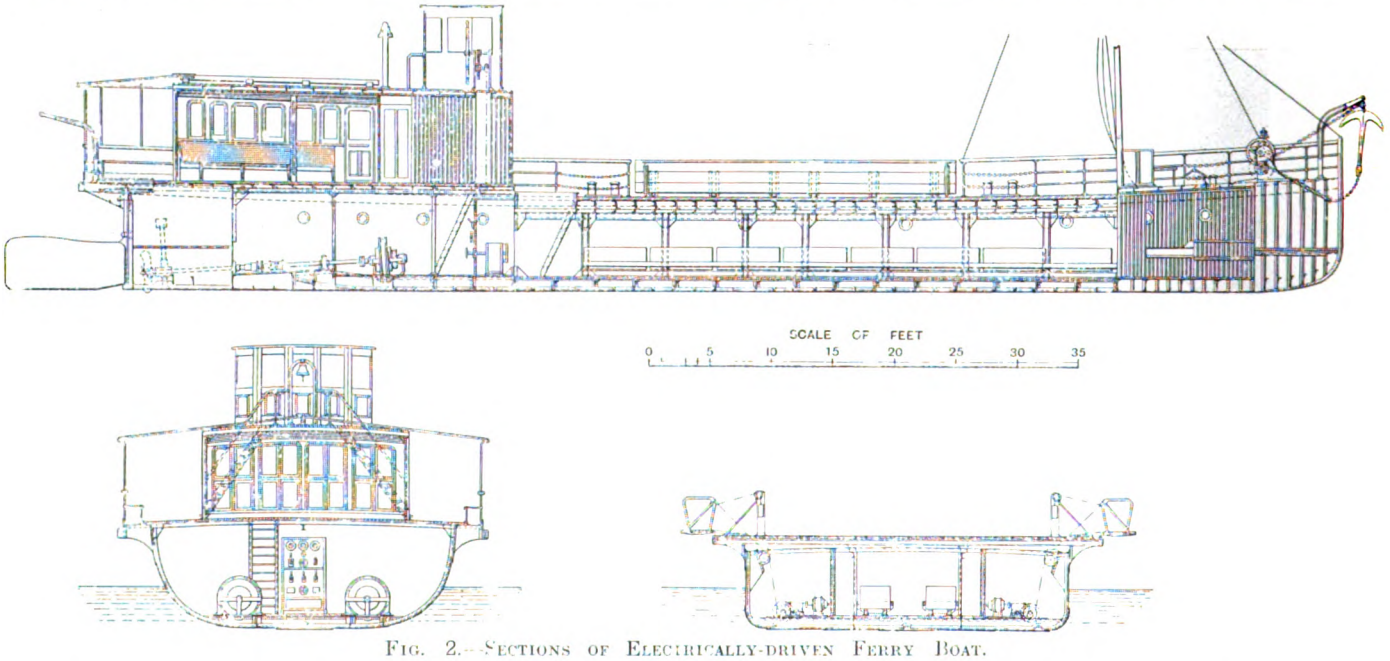

Fig. 2.—Sections of Electrically-driven Ferry Boat.

The boat is propelled by two screws, each of which is driven by an open-type interpole series motor directly coupled to the propeller shaft. The motors, one of which is shown in Fig. 3, are rated at 50 h.p. each, at 300 volts and 300 revolutions per minute, and are of very compact and light construction, being especially designed for the work. The magnet frames are of cast

Digitized by Google

steel, and the necessary stiffness is obtained by making them of U-section. The outer bearings of the motor are bracketed to the magnet frame, and the provision of a special bed-plate is thus rendered unnecessary.

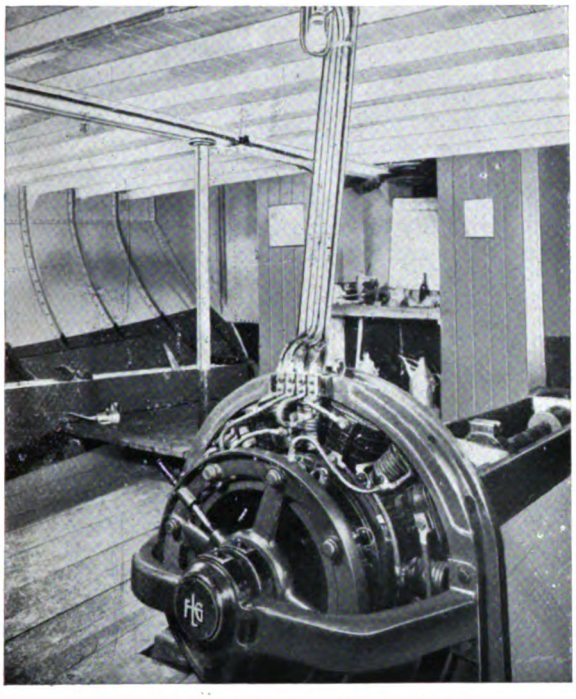

Fig. 3.—50-h.p. Interpole Series Motor.

The motors are equipped with commutating poles, by means of which it is possible to vary the speed within the widest limits and to reverse the direction of rotation suddenly without causing sparking at the brushes.

The starting and regulating apparatus for the motors is contained in the navigating cabin, the interior of which is shown in Figs. 4 and 5. Two reversing controllers are fastened to the wall of the cabin, and are

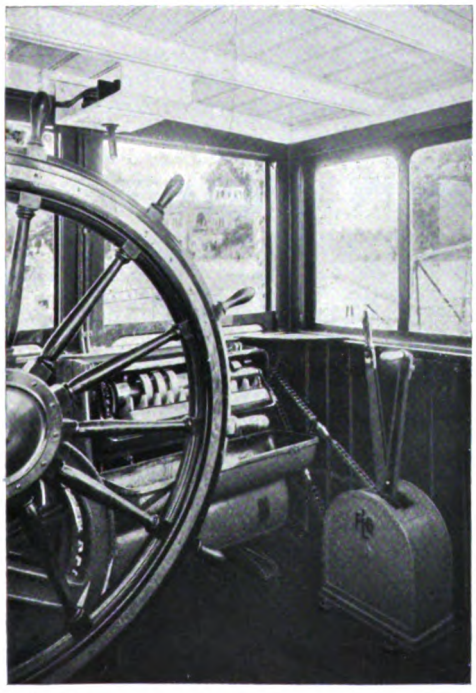

Fig. 4.—Interior of Navigating Cabin, showing Starting Levers and Reversing Controllers.

actuated through chain gearing by the levers seen to the right of the helm in Fig. 4. By imparting a forward or backward motion to either of the levers alone, the corresponding propeller motor is started up in the direction to cause forward or backward motion of the boat. To operate both motors together a stud at the top of the straight-handled lever is pressed down, and a catch is thereby brought into play by

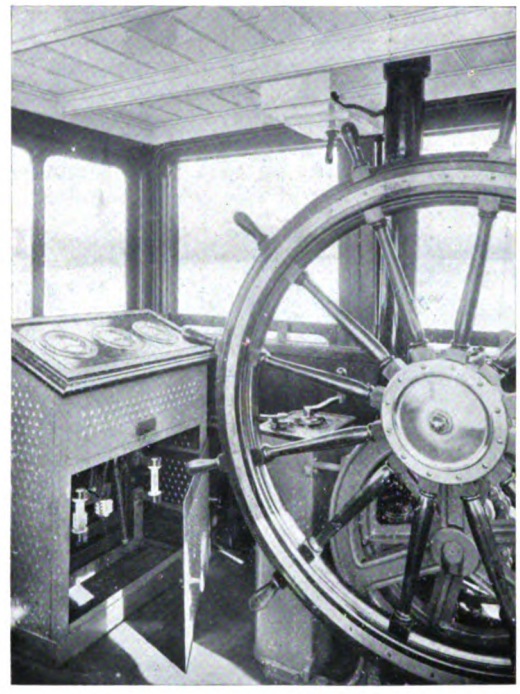

Fig. 5.—Interior of Navigating Cabin, showing Main Fuses, Instrument, Desk-Panel, and Controller for Landing-Flap Motors.

means of which the two levers are locked together. In addition to the two controllers for the propeller motors, the cabin contains a third, employed to operate either of the two small motors actuating the landing gangways. Fig. 5 also shows the instrument desk-panel, on which are mounted a voltmeter and two ammeters in the propeller-motor circuits. Two overload circuit-breakers, one for each motor-circuit, are mounted on the ceiling of the cabin.

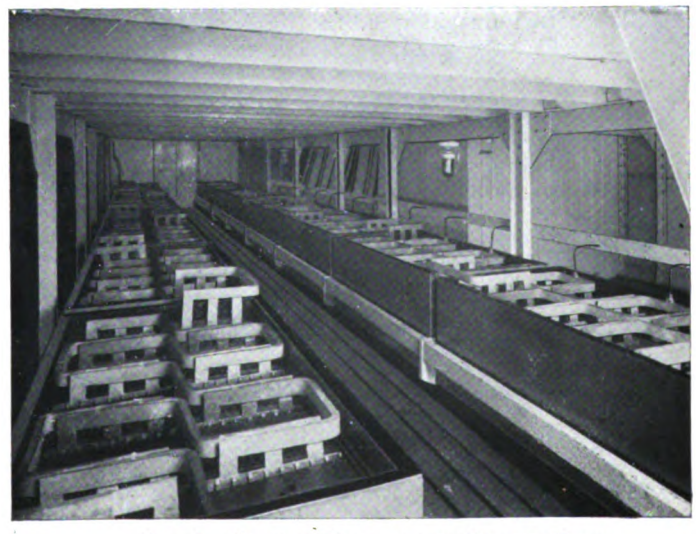

Fig. 6.—General View of the Battery Room.

The motors derive their current from a battery located below deck, consisting of 160 cells mounted in vulcanite cases, which are arranged in sixteen sets of ten each, each set being contained in a wooden trough. The battery has a capacity of 335 ampere-hours on a one-hour discharge rating, the pressure averaging 290/300 volts. The battery-room is thoroughly ventilated by numerous port-holes and

Digitized by Google

outlet pipes. A general view of the battery-room is given in Fig. 6. The two small motors—each of 3 h.p.—which operate the landing gangways are installed in the battery-room, and in order to protect them from acid fumes they are enclosed in a wooden casing. The battery is charged on the left bank of the river, current being taken from the Godesberg Electricity Works. Plug contacts are provided for the purpose on the landing-stage and on the boat, an armoured cable being carried on the boat to make the connection. These are shown in use in Fig. 7.

The main switchboard, on which are mounted the battery charging switch and the switches and fuses for

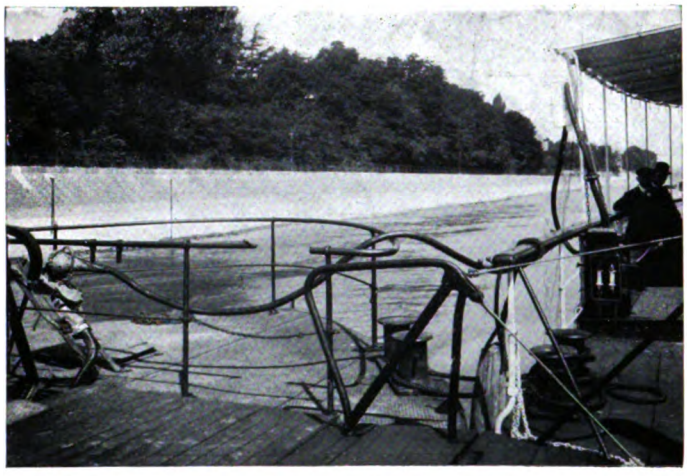

Fig. 7.—Plug Contacts in use at Landing-Stage for Charging.

the various lighting circuits, is erected in the machine-room, in which the motor-controller resistances are also located. For pumping out the boat a small pump, driven by a motor through a "Centrator" reduction gear, is provided. This is capable of dealing with 1,050 gallons of water per hour, and is also employed to supply with water the cisterns in connection with the toilet and washing arrangements. The scheme of lighting comprises twenty-eight incandescent lamps, suitably distributed in the various parts of the boat. The interior appointments of the passenger saloon are tastefully carried out in oak, in the Viennese style. There are eight large windows, which may be lowered in fine weather. The floor is laid with parquet linoleum, and a stove is provided to heat the saloon in winter.

The landing stages on either side of the river each consist of a pontoon, 52 ft. 6 in. by 16 ft. 5 in., connected to the shore by means of a bridge 82 ft. long and 26 ft. 3 in. wide on the Godesberg side, and 82 ft. by 13 ft. 1½ in. on the Niederdollendorf side. The ferry-boat was constructed to the designs of the firm of Ewald Berninghaus, Duisburg, and the complete electrical equipment was supplied by the Felten & Guilleaume-Lahmeyerwerke A.-G., of Frankfort-on-Main. Before its introduction, the cross-river traffic was dealt with by a cable ferry, which frequently obstructed the water-way, to the no small annoyance of other users of the river. This has now been done away with without creating a fresh nuisance in the shape of smoke from a steam-propelled ferry.

In conclusion may be given the average results of a number of tests which were made on July 27th, when the ferry-boat was put into service:—

(1) Crossing from Godesberg to Niederdollendorf—

Port screw working, about ...	70 seconds.
Starboard screw working, about	150 ,,
Time occupied on journey ...	4 minutes.
Average current taken by port motor	145 amperes.
Average current taken by starboard motor	134 ,,

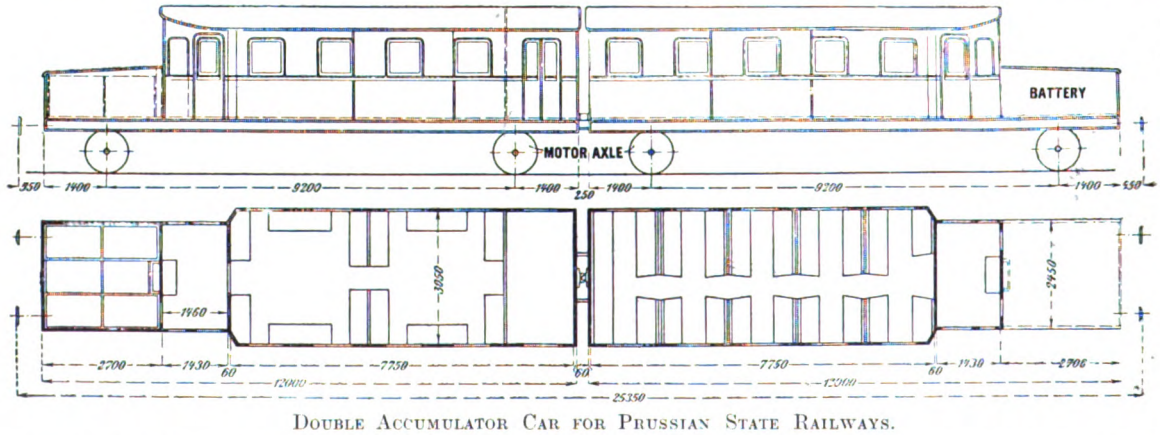
(2) Crossing from Niederdollendorf to Godesberg—

Port screw working, about ...	130 seconds.
Starboard screw working, about	180 ,,
Time occupied on journey ...	5 minutes.
Average current taken by port motor	137 amperes.
Average current taken by starboard motor	142 ,,

The motor current amounted in each case to about 50 amperes upon closing the circuit, and rose to 150 or 160 amperes when the starting resistances were short-circuited, as was always the case upon the open river, no speed regulation proving necessary. The speed of the motors was 320 revolutions per minute. The specific gravity of the battery acid was 1·25 at the commencement of discharge, and 1·15 after the eighth double trip.

ACCUMULATOR RAILWAY CARS IN GERMANY

About eighteen months ago five accumulator railway cars were put into service by the Prussian State Railways, in the neighbourhood of Mainz. Some particulars of these cars were published in Electrical Engineering, Vol. II., p. 206, and the results of the first year of working, with detail costs of running, expressed in pence per car-mile, were given in Electrical Engineering, Vol. III., p. 470. These results were so satisfactory that the Prussian State Railways ordered 57 new double cars of a new pattern, 19 each from the Allgemeine Elektricitäts Ges., Siemens-Schuckert Werke, and Felten & Guilleaume-Lahmeyerwerke. The cars have been designed, however, by Oberbaurat Wittfeld, of the State Railway Department



Double Accumulator Car for Prussian State Railways.

Two of these double cars have, according to the *Elektrotechnische Zeitschrift*, been delivered by the first-mentioned firm, and are running between Tempelhof and Zossen. The cars are to be used for the purpose of supplementing the service provided

Digitized by Google

by the heavy through-running trains, for suburban traffic, especially for connecting outlying districts with the stations at which the through-running trains stop, and for districts where the traffic is not sufficient to cause a steam service to be remunerative.

The units which have just been put in service each consist of two four-wheel cars coupled together, as shown in the figure opposite. Each car carries half the battery in a special shallow compartment in front of the driver's cabin, which overlooks it. This arrangement is preferable to that in which the cells are arranged under the seats, as it was found impossible to avoid damage to the car fittings by the acid and the gases evolved. The fumes from the cells also made it unpleasant for the passengers. Including a certain amount of standing room, the double car can carry one hundred passengers. Entrance to each car is through the driver's cabin. The electrical equipment of the complete combination consists of two interpole series motors, one on each car, rated at 50 h.p. each for two hours, or 80 h.p. on the one-hour rating basis. Series-parallel control is effected from either of the two drivers' cabins. The battery, consisting of 168 cells, 84 in each compartment, gives a total pressure of at least 310 volts, and has a capacity of 368 ampere-hours. The total weight of the double car is about 55 tons. A distance of at least 100 kilometres (62 miles) can be run on one charge, and a maximum speed of 50 kilometres per hour (31 miles per hour) can be attained on the level. The cars are provided with compressed air brakes, one motor compressor sufficing for both cars. Each controller has the usual "dead-man's" handle, which, if released, causes the current to be cut off and the brakes applied in whatever position the controller may be. The starting resistances are placed under the cars. The batteries for these cars were supplied by the Akkumulatorenfabrik Akt.-Ges, of Berlin, who, it will be remembered, supplied the batteries for the Mainz cars, and agreed to keep them all in good condition for a period of five years, and to replace all parts damaged through use under normal conditions, for an inclusive charge of 1·55d. per car-mile.

Similar cars to the above, also to be supplied by the Allgemeine Elektricitäts Ges., will be run on the local line from Königsberg to Insterburg. The 19 cars from the Felten & Guilleaume-Lahmeyerwerke will be put in service on the lines Cologne-Remagen, Cologne-Aix-la-Chapelle, and Cologne-Niederlahnstein. Accumulator cars with a seating capacity of 80, and capable of running a distance of 50 to 70 kilometres (31 to 44 miles) on one charge, are being run on the lines Osterfeld-Heissen, and Heissen-Hattingen, in the Ruhr district. During the winter similar cars will be put in service on the line from München Gladbach to Düren, near Cologne.

POWER SUPPLY AND ITS EFFECT ON THE NORTH-EAST COAST

SEVERAL speakers took part in the discussion on the Paper read by Mr. C. H. Merz on the above subject at the Middlesbrough meeting of the Iron and Steel Institute. In the Paper itself, which was given in an abridged form in our last issue, the author gave some particulars of the growth of the undertaking of the Newcastle-upon-Tyne Electric Supply Co., which now works in connection with the Durham Electrical Power Distribution Co. and the Cleveland and Durham Electric Power Co., part of the plant of which has been altered to be of the same frequency. The whole scheme now combines eight generating stations aggregating 136,550 h.p. (including three waste heat stations), and three representing an additional 34,000 h.p. are under construction. The Paper considered the questions of utilising the waste heat from coke ovens and blast furnaces, &c., and pointed out the advantages of co-operation with a power company in this direction.

The discussion may be said to have added very little of interest to the contents of the Paper. Mr. T. Westgarth announced himself as an enthusiastic believer in gas engines, and criticised the absence of reference to gas engines in the Paper. Low as is the cost of production in the waste heat stations at the present time by the use of gas engines, he said considerably more power would be produced. The fuel economy is greater and the other running costs of a gas engine station need not be more than that of a steam plant. As regards the reliability of gas engines it was quite true that in the earlier days, at Hickman's, at Froddingham's, and at Cochran's works there has been a certain amount of trouble, but in spite of this fact they continue to extend their gas engine plant, while at Barrow and at Coltness gas engines are being put down for dynamos and blowing engines.

Mr. Greiner, of Cockerell & Cie., Seraing, described how in his works the various departments deal with the matter of charging for electric power. The departments are all separate, and the electric power department buys the power in the first case from the steel department, and then, having converted it into electricity, sells it to the different departments. He said that there were 11,000 h.p. of gas engines in the works, producing electricity, but as there was no power company in the neighbourhood a co-operative scheme of the kind described in the Paper was impossible to them. If they had an opportunity of co-operating with an outside company who would buy all their excess power, they would only be too glad to do so, more especially with the object of counteracting the effect of trade fluctuations upon the output of power.

M. Goubet also spoke in favour of gas engines and the cost of maintenance, provided the gas is properly cleaned.

Mr. Selby Bigge, after congratulating the author upon his success in bringing unification about on the North-East Coast, dwelt upon the fact that only 15 per cent. of the total power of the power companies was to be found in the waste heat stations, though doubtless the output in units was more. He mentioned that in Silesia current was generated at ¼d. a unit from waste heat all told, which compared apparently with 0·35d. per unit in the coal-fired stations in this district. He mentioned a case where 15,000 h.p. of gas engines was installed, and where 5,000 was used for neighbouring collieries, 1,000 for other purposes about the furnaces, and the rest sold.

Mr. Carnegie (Samuel Osborne & Co.), of Sheffield, agreed with what the author said about small users doing better to buy current than to generate it. He wished to know what size of private plant it would pay to put down. He said that they had a rolling mill which was driven by power supplied by the Sheffield Corporation, the price of current being on a sliding scale working out at about 0·6d. per unit.

Mr. Merz, in reply, pointed out that although the waste heat stations at the present only represented 15 per cent. of the total power installed, they would next year, owing to their higher load factor, produce nearly half the total output. The relative merits of gas and steam had nothing to do with the relative merits of co-operation for independent plants. If gas engines ultimately proved the cheapest form of production they could be put down in the co-operative waste heat stations just as easily as in private plants. With regard to the question of when it paid to put in a private plant, such a question could, of course, only arise in the case of people who possessed waste heat. Where there was no waste heat no one but a crank in that district would think of putting down a private plant, but where there was waste heat, each case had to be judged upon its merits, and in every case some co-operative scheme would be found more advantageous than an independent scheme.

The President (Sir Hugh Bell), in a short speech at the close, said that while it was very interesting listening to relative merits of gas and steam, the only thing people need bother about in that district was, whenever buying electrical apparatus or installing private plants, to be sure to see that their frequency and voltage are the same as that of the power company. Then, if they had more power than they wanted, the power company would be glad to buy it from them; if they had less power than they wanted, the power company could sell it to them.

The Institution Dinner.—The annual dinner of the Institution of Electrical Engineers will be held on Thursday, October 22nd, at 7 for 7.30 p.m., in the Grand Hall of the Hotel Cecil, Strand, London.

Proposed London Electric Railways.—It is stated that a syndicate has been formed to promote a Bill in Parliament for the construction of a tube railway from Victoria and Charing Cross to the Crystal Palace. The proposed route is by way of Peckham, Forest Hill, and Upper Sydenham, to the north-west end of the Crystal Palace.

An extension of the Putney and Wimbledon branch of the District Railway to Sutton is under consideration.

Davy Arc Lamps.—With reference to the article on page 489 of our last issue upon the new works of Arc Lamps, Ltd., at St. Albans, we are asked to point out that these were erected from the designs and under the supervision of Mr. R. A. Briggs, C.E. A.M.I.M.E., of Harpenden, and partner in the firm of Messrs. Frank Matcham & Co., of 9 Warwick Court, Holborn, London.

Obituary.—We regret to announce the death of Mr. Bennett H. Brough, the secretary of the Iron and Steel Institute. Mr. Brough had been in attendance at the Middlesbrough meeting of the Institute, but was seized with illness at the close, and was removed to Newcastle, where an operation proved fatal. Mr. Brough became secretary of the Iron and Steel Institute in 1895, and it was as his assistant that Mr. G. C. Lloyd was working when appointed to the secretaryship of the Institution of Electrical Engineers.

ACCIDENT AT CHELSEA GENERATING STATION OF THE UNDERGROUND ELECTRIC RAILWAYS COMPANY OF LONDON

By the courtesy of Mr. J. R. Chapman, Chief Engineer of the Underground Electric Railways Co. of London, we are able to publish a full account of the cause of the accident at the Lots Road power-house on Saturday last, which resulted in a stoppage of the District Railway and three tube railways for about two hours.

At 2.45 on the afternoon of Saturday, with five 5,500 kw. turbo-generators in service, all carrying approximately full load, one phase was suddenly earthed, bringing into action all the static dischargers and other safety devices in the house, and making it necessary to trip the circuit breakers on the exciters and thus shut down the generators and the 26 sub-stations supplied therefrom.

This brought all trains and lifts to a standstill on the Bakerloo, Piccadilly, and Hampstead Tube Railways, as well as on the District Railway and the Wimbledon and Surbiton sections of the London United Tramways.

A review of the whole situation indicates that the initial cause of the trouble was a "short" as between the primary and secondary windings of a series transformer in one of the conductors between the generator and its oil switch. These transformers, of which there are, of course, three on each generator, are about 8 in. in diameter and 10 in. long; ratio, 100: 1; normal load, 300 amps. Their secondary extends to the control board, and actuates the ammeters, wattmeters, &c., thereon. Each transformer is placed in a brick compartment with one open side, so that if a failure occurs there is ample room for the arc to escape. Such transformers are necessarily weak, and have failed before in both the generating station and in the sub-stations. They have what may be described as a squirrel-cage form of winding, and are accurate within ½ per cent. at all loads. This essential accuracy requires the coils to be very close together, thus increasing the risk of breakdown. The frames of these transformers, also one point in the secondary leading to the control board, are earthed.

The copper earthing strips in the Chelsea generating station are of very large capacity, and, of course, it only took a few seconds to develop sufficient internal pressure in the transformer to cause it to explode. After passing through the transformer the machine cable is carried vertically through porcelain insulators in the concrete floor above and into brick compartments containing the oil switch. In this instance the force of the explosion drove the arc and flame up through the insulators, thus short circuiting the cables leading to and from the base of the oil switch. The opening of this switch failed to disconnect the machine cables from the 'bus bars. These 'bus bars are divided into five sections, and oil switches of large capacity couple these sections.

The surge of current, however, owing to the earthing of one phase, was so great that a number of the static dischargers on the feeder cables were overtaxed and bridged, so that it became necessary to shut down completely in order to clear up the earth connections through the safety devices. The total damage was trifling; even the oil switch above the transformer was ready for service the next morning, and there were enough spare turbo-generators to carry the whole load, and the isolating switch blades were simply opened on the damaged oil switch. It took some little time, however, to clear up the earth connections on the 186 static discharge panels and thus make sure that it was safe to put 11,000 volts on the 'bus bars again. Two similar series transformers failed on feeder cables, and one feeder oil switch out of 33 that were in service at the time was slightly damaged.

All sub-stations are supplied through duplicate cables, and, of course, the first supposition was that such a heavy surge might have damaged the cables which were in service, hence all sub-stations were started with the cables which had not been in service at the time of the accident. The rotary converters in nearly all the sub-stations were reversed, hence, generally, the load was taken by the machines which were previously idle, and the polarity of the other machines was thus made normal. A few rotaries flashed over, but that was the extent of the damage in the sub-stations. Of the 357 miles of three-phase cable leading to the sub-stations, there was not a single failure.

There were no personal injuries of any kind, either in the generating station or in the sub-stations.

The accident proves that 2½ feet of free air space and a six-inch concrete floor are not sufficient between one of these series transformers and the oil switch, hence this will be increased to eight feet. Further, that all space between the cable and the inside walls of the insulator should be caulked tight, and with a view of limiting the field of influence when one of these little transformers fail, they will be enclosed in a somewhat larger brick chamber with one side open as at present.

The neutral point of all the generators is earthed through a cast-iron grid resistance of about 7 ohms resistance and 2,000 amperes capacity.

The static discharge panels are each 5 ft. long, have eight gaps of 0·0047 in. each, and a carbon resistance rod ¾ in. diameter and 33 in. long, its resistance being 375 megohms.

The London Electric Power Bills.—*The Daily Chronicle* reports that a conference of local authorities in London and district took place at the Shoreditch Town Hall, on Thursday, for the purpose of considering the London and District Electricity Supply Bill and the London Electric Supply Companies Bill, now before Parliament. The authorities represented comprised Fulham, Finchley, Hornsey, Croydon, St. Pancras, Barnes, Wimbledon, Shoreditch, Camberwell, Islington, Battersea, and Bethnal Green. On the proposition of the Town Clerk of Camberwell, seconded by Councillor Windus (Camberwell), a resolution was adopted protesting against the principles contained in the London and District Bill, but expressing the opinion that in the event of the measure becoming law the purchase clause should be amended so as to provide that if the undertaking is purchased in 1931 or 1936, the amount paid for goodwill in addition to the then value of the land, buildings, works, &c., shall not exceed twenty years' compensation, based upon the net annual profits as shown by the accounts of the company during the period of the concession already expired. Mr. Tagg also moved in regard to the London Electric Supply Companies Bill that a sterilisation clause similar to that imposed upon the water companies be inserted for the protection of London ratepayers, together with another condition prohibiting the companies from receiving compensation in respect of severance. The resolution was adopted. It was further decided to ask Mr. Winston Churchill, the President of the Board of Trade, to receive a deputation for the purpose of placing before him the case of the borough councils for being given linking up powers.

The above is the wording of the resolution, as reported, but we may point out that Clause 67 of the London and District Electricity Supply Bill provides for purchase in the year 1931, 1941, or 1951. The purchase terms are to be "the then value" of the undertaking should the purchase not take place until 1951, but should the London County Council decide to put its powers into force in 1931 or 1941, as it is empowered to do under the Bill as it now stands, there will, in addition, have to be paid a sum as compensation, which must be determined by arbitration if no agreement can be come to. The word "goodwill" does not occur in the clause.

LOCAL NOTES

ABERDEEN: *Supply for Wireless Telegraphy.*—With reference to the agreement between the Corporation and the Admiralty for the supply of electrical energy to the new wireless telegraph station at Stoneywood, the Admiralty have asked for a clause to the effect that the agreement may be renewed on agreed terms upon its expiration, and, failing agreement, a new agreement should be submitted to arbitration. The Corporation have consented to this. The present agreement remains in force for five years.

ACCRINGTON: *Electric Lighting Provisional Orders.*—The Corporation is to apply for electric lighting provisional orders for the districts of Church and Clayton-le-Moor.

BELFAST: *Automatic Point Controllers.*—All the automatic point controllers which it was recently decided to install upon the tramways, have now been fitted, and it is estimated that a saving of £1,500 per annum will be effected, as compared with the cost of the old manual system.

BIRMINGHAM: *Tramway Extension.*—Differences of opinion still continue regarding the proposed tramway extension to Stechford. The latest development is that the Yardley Rural District Council has passed a resolution against the extension.

Water Purification.—The Paterson Engineering Co. inform us that at the Corporation generating station all the mechanical oil separators in the 2,000 kw. sets have been replaced by a Paterson oil eliminator of 350,000 lb. hourly capacity. We believe that this is the largest plant of its kind, and the results of tests (based on six months' working) by Mr. R. A. Chattock, the City Electrical Engineer, shows that the total cost for chemical reagents was proved to be 3d. per thousand gallons purified. The temperature of the water leaving the purifier was 4–5° higher than when entering, owing to the fact that one or two traps on the steam gauge discharged into the filter tanks. The public analyst's report on the water as discharged by the Paterson purifier stated that it was absolutely free from all trace of oil.

BLACKBURN: *Tramway Extensions.*—The Corporation has decided that the tramway extensions authorised by the Blackburn Corporation Act, 1908, with one exception, shall be proceeded with.

Electricity Charges.—The Corporation has referred to a subcommittee the question of making a reduction in the charge for electric current to electrical contractors for the purpose of exhibiting and displaying electrical apparatus.

CARDIFF: *Electricity and Tramway Finances.*—A statement has been issued by the elective auditor, in which he states that, since his last report, funds have been created in connection with the electric lighting undertaking to provide for depreciation and renewals, although at the time he drew attention to the need for such provision the correctness of his statement was challenged and the department held to be in a flourishing condition. With regard to the tramways, it is mentioned that particular attention has now been paid to provision for depreciation, and with improved finances consequent on increased revenue and decreased expenditure, there is every reason to believe that the accounts will now be placed on a sound basis. For the year 1907 the net profit was £994 0s. 3d., and for 1908 £8,807 13s. Both those sums have been rightly appropriated, with other moneys, for depreciation.

Electricity Canvasser.—A councillor's recommendation that a canvasser should be appointed to the electricity undertaking has been defeated. Mr. Arthur Ellis, the engineer and manager, said that a regular system of canvassing exists, and an alteration in the present methods is not desirable.

CLEETHORPES: *Electric Lighting Provisional Order.*—The Board of Trade have communicated with the Council with regard to their electric lighting Provisional Order which was granted in 1900. After discussion, it has been decided to ask the Board to grant an extension order, to include certain powers now embodied in Provisional Orders, but which were not inserted in the Council's original order.

COLCHESTER: *Tramway Accounts.*—At the last meeting of the Corporation it was announced that the deficit on the half-year's working of the municipal tramways would be £1,928, which exceeds the deficit on the corresponding period of last year by £589.

DOVER: *Admiralty Supply.*—The draft agreement with the Admiralty for a supply of electrical energy has been considered by the Council. Arrangements are being made for a temporary supply to the Admiralty Pier extension signal station.

Electric Lighting Loan.—As the Local Government Board has adhered to their decision, given a short while ago, not to grant a loan of £1,190 in connection with the St. Margaret's extension, the communication has been sent by the Corporation pointing out that the loan would only be for a short period, and would be repaid to the bank by annual instalments.

EPSOM: *Electricity Finances.*—According to the electric lighting estimates for the period ending March 31st, 1909, the general district fund will have to provide approximately £479.

ERITH: *London Electric Power Bills.*—Mr. James Rowlands, M.P. for the district, has asked to be furnished with latest information concerning the Council's electricity undertaking. The Council has decided to furnish Mr. Rowlands with copies of the reports and accounts for the past three years, and any further information he may require.

Departmental Administration.—In May last, a committee was appointed by the Council to consider the administrative expenditure of the various departments, and to report. The following comments are made upon the lighting and tramways departments:—"Electric lighting and tramways departments.—(1) Electric lighting: In the electric lighting department the committee finds that the system of book-keeping duplicates, to a considerable extent, the work done in the accountant's department, and that such duplication is unnecessary. (2) Tramways department: Certain books kept in the tramways department might more properly be kept in the accountant's department, and there is also some unnecessary duplication in this department of work done in the accountant's department. (3) Management of undertakings: The committee is of opinion, after carefully reviewing the administration of the electric lighting and tramways departments, that considerable economy, and at the same time increased efficiency in administration would be effected if the management of the two undertakings was vested in one officer." The report has been adopted, and the committee authorised to draw up a scheme of reorganisation.

GREENOCK.—*Electricity Accounts.*—The annual report of Mr. J. A. Robertson, the burgh electrical engineer, states that the total output increased from 2,681,805 units to 3,275,018 units. The average price received for lighting was 2·95d., against 3·05d. last year; for power purposes 1·16d., against 1·17d., and for traction 1·40d., against 1·37d. The gross profits, after meeting working expenses, amount to £8,967.

HORNSEY: *Electric Supply.*—The electrical engineer has reported that the number of consumers connected at July 31st, 1908, was 1,359, and that there had since been a net increase of 19. The number of 8-c.p. lamps connected was 71,922, a net increase of 591. From April to August mains had been laid in 12 roads. The engineer was authorised to arrange for the exhibition of posters at a cost not exceeding £25 per annum.—A ten days' show of electrical stoves, &c., is to be held at Muswell Hill, the cost to be limited to £5.

HULL: *Municipal Telephone System.*—The whole of the necessary works for establishing intercommunication between the municipal and company's telephone systems have now been completed. The cost to the Corporation alone has been £700 in alterations to the subscribers' instruments.

ITALY: *Water-Power Concessions.*—The Acting British Consul at Palermo (Mr. W. A. Morrison) reports that a concession has been granted by the Italian Government to the "Società Elettrica della Sicilia Orientale" (of Milan) for the appropriation of water from the River Cassibile for a term of 30 years, for the generation of electric power. The river derives its supply of water from the mountains of Canicattini Bagni, and empties into the sea near the village of Cassibile between Syracuse and Avola. The difference of level is 300 metres, and the supply of water is calculated to develop a force of 5,000 horse-power. The objects of the "Società" are to supply electric power for private enterprise, and to construct and work electric tramways between Syracuse and some of the towns in that province. The necessary outlay for the purchase of plant and the construction of canals and reservoirs is estimated at two million lire (about £80,000). The work is to be completed by the end of 1909.

Electric Supply.—According to a British Consular report, the Valdarno Mining and Electrical Company, which has a capital of £240,000, works some extensive lignite mines in the commune of Cavriglia, and large electric works have recently been erected for the purpose of using their own coal as fuel for the production of electrical power to be distributed for lighting, &c., to the neighbouring cities. Electrical current will be conveyed to Florence, Prato, Siena and Arezzo by means of cables, which are now being laid. The current is on the three-wire system at 33,000 volts. The machinery has been partly supplied by the Westinghouse Company and partly by German firms; the engines, supports, gauge tracks, &c., are of Italian manufacture. Its output of lignite is at present about 180,000 tons. There is a briquette factory adjoining.

KOREA: *Electric Railway.*—A British Consular report upon the trade of Korea for the year 1907, states that the Chemulpo Electric Company proposes to construct an electric tramway to run past the jetty of the General Foreign Settlement to various parts of the Japanese Settlement and outside districts.

LAUNCESTON (TASMANIA): *Electricity Supply.*—In consequence of the exceedingly rapid increase in the demand for electrical energy, the Council have, says the *Australian Mining Standard*, called for reports from the City Electrical Engineer

Digitized by Google

and the City Engineer with regard to extensions. The matter of extending the electric light plant involves an application to Parliament for further borrowing power, which, at the present time, has been exceeded by about £8,000. The Council has Parliamentary sanction to borrow £160,000 on electric light account, but to date its capital expenditure is approaching £170,000. The increase in the use of electric power is very marked. At the end of 1906, 641 h.p. was in use, an improvement for the twelve months of 217. At the end of last year the horse-power had crept up to 799; to-day it is about 1,000 h.p. Messrs. Strike & David, the Council's engineers, will be asked to advise as to what additional power can be obtained from the river, by what means, and at what cost.

LEICESTER: *Electricity Accounts.*—The report of the Electric Lighting Committee was adopted at the last Council meeting. The expenditure during the year amounted to £6,698 and the revenue to £15,847. After meeting capital charges there is a net profit of £2,739, or £673 less than for the previous year. It was pointed out that although the number of consumers has increased by 77, the consumption has decreased owing to the greater use of metal filament lamps.

LIVERPOOL: *Electricity Charges.*—A demand is being made for a reduction in the charges now made for electrical energy for lighting and power purposes, and the coming elections in November are likely to be fought mainly on this matter. Comparisons are being made between Liverpool and other towns, mention being specifically made of Manchester, which has had a much lower power rate for many years. Quite recently Warrington has brought into use a reduced scale of charges for power users, viz., 2d. for the first 1,000 units, and 1d. per unit after, with a discount, and this is being contrasted with Liverpool's 2d. for the first 3,000 units, 1½d. per unit for the succeeding 7,000 units, and 1d. per unit for all consumption afterwards. Further, Liverpool still charge meter rents, which are being abolished in so many other places, whilst the practice of allowing a percentage of the power consumption for lighting at the power rates has not yet been instituted.

Lister Drive Steam Turbines.—Mr. A. Bromley Holmes, the Consulting Engineer to the Corporation, has now presented his final report upon the four turbo-alternators supplied by the Westinghouse Co. for the Lister Drive power station. It appears that the machines came up to specification with the exception of steam consumption per kilowatt hour, and after fully considering the position, the contractors decided to re-make the rotor of each turbine at considerable expense, and for this purpose the machines were handed over to the contractors one at a time. The result of the re-construction has proved very satisfactory, as in each case the steam consumption per kilowatt-hour named in the specification has been attained.

LONDON: *Islington: Tramways.*—The London County Council have intimated that in the next Session of Parliament they again propose to apply for powers to construct a single line of tramways from Essex Road to Kingsland Road *via* Englefield Road, and remind the Council that in the session 1907-8 they consented to the construction of the proposed tramways, but owing to the opposition of the Hackney Council the lines could not be proceeded with.

Kensington: Tramways.—The Works Committee recommend the Borough Council to inform the London County Council that they are not prepared to give their consent to the proposed tramways from Battersea Bridge to Shepherd's Bush. The Borough Council are also requesting the Chelsea Borough Council to withhold their consent to the scheme. A ratepayers' meeting has also been held protesting against the proposed tramways.

Lambeth: London Power Bills.—The General Purposes Committee object to the purchasing powers proposed to be conferred on the L.C.C. by the London Electric Supply Bills on account of its effect on the Borough Council's power of purchase of the South London Electric Supply Corporation. The Council has therefore decided to lodge petitions against the Bills.

Lewisham: Tramcar Mishap.—The axle of a fully loaded London County Council tramcar broke on Wednesday week at the top of Loampit Hill, Lewisham.

Paddington: London Electric Power Bills.—The Parliamentary Committee of the Borough Council, in reporting on the London Electric Power Bills, urged the Council to resist anything which will affect their powers of purchase of the portion of the Metropolitan Electric Supply Co.'s undertaking, under the company's Electric Lighting Order of 1890. They recommend petitions to be presented against both Bills in the House of Commons.

LUTON: *Meter Rents.*—A proposition to abolish meter rents was put before the Council last week, but the Chairman of the Electricity Committee stated that they would view this with favour when the undertaking was in a little more flourishing condition. At present meter rents were responsible for a revenue of £60 per annum. The proposition has, therefore, been deferred.

MANCHESTER: *The Mutual Telephone Syndicate.*—Notice of the following resolution has been given by Councillor Skinner:—"That a Special Committee be appointed to consider and report upon the position of the Mutual Telephone Syndicate, Limited, and the Corporation, and as to whether or not any payments should be made by the Corporation to reimburse to some extent the expenditure incurred by the Syndicate in their efforts to promote for the City of Manchester a cheaper and more efficient telephone service." Resolutions to the contrary were passed by the City Council in March and May of this year, but it is proposed that these should be rescinded. The present resolution is signed by 10 aldermen and 35 councillors.

MIDDLETON: *Tramways Lease.*—Notice is given of the intention of the Corporation to lease certain tramways to the Manchester Corporation for a period of 21 years, commencing from December 24th, 1902. The rent has been agreed upon at £9,549 19s. 10d. for the period between December 24th, 1902, and June 24th, 1908, and afterwards £1,736 7s. 3d. per annum.

SPAIN: *Electric Tramways.*—A British Consular report upon the trade of Spain in 1907, states that the promised electric tramways have not yet appeared in Corunna. It is hoped, however, that so soon as the necessary formalities have been completed by the Belgian company interested in the scheme and the local authorities, new lines will be constructed, not only in Corunna but also in Vigo and other towns in this district.

Electric Cranes.—A large electric tip, erected at a heavy cost, has already begun to work at the Port of Musel (Gijon), about the capacity of which at this date it is not advisable to hazard a statement, and alterations are already talked of as necessary. The coal and minerals are tipped from the railway trucks into hoppers, which shoot their contents into large buckets carried on electric trolleys running on the low level, which, on arrival at the ship's side, are picked up by a crane or transporter with a horizontal jib or arm and carried over the ship's hatches. Another loading tip is in course of construction which is of a more simple kind, as it will shoot the coal direct into the ship's hold. It is expected to be ready for operations at the end of 1908.

TOTTENHAM: *Centre Pole Lighting.*—The District Council have entered into a contract with the North Metropolitan Electric Power Supply Co. to light the tramway centre poles in the Green Lanes and High Road, but as the lighting will cost £700 a year, and the estimates have been sent back to the various Committees to be reduced, it is not probable that the lighting will be effected this winter.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ECCLES.—The local Co-operative Society are thinking of installing electrical plant in certain of their depôts.

FARNWORTH.—We understand that Messrs. Prestwichs, of the Pandora Mills, and Messrs. Pilkethean, of the Cawdor Street, are thinking of putting down certain electrical plant.

LONDON: *London County Council.*—Tenders are invited for the supply of 12 water-tube boilers, with mechanical stokers and superheaters, each boiler capable of evaporating 15,000 lb. of water per hour. Particulars from the Clerk to the Council (fee £2 returnable), and tenders by October 27th.

Stepney.—The Finance Committee have applied to the L.C.C. for a loan of £7,000, as a supplemental estimate, towards defraying the cost of the erection of the generating station at Blyth's Wharf.

ROCHDALE.—The Guardians invite tenders for the erection of an overhead bare copper cable at their workhouse. Particulars from the Clerk, and tenders by the 15th inst.

SALFORD.—The Electricity Committee invites tenders for the supply and delivery at the Frederick Road generating station of vertical steam and feed pumps. Particulars from the Electrical Engineer, Mr. V. A. H. McCowen, and tenders to the Town Clerk by October 12th.

SWINTON.—Among a number of firms who are contemplating electrical installation are Messrs. Holdsworth & Gibbs, Moorside Road Mills; Messrs. Partington's, Hazlehurst Mill; and Messrs. Bolds, of the Swinton Hall Road Mill.

TWICKENHAM.—Tenders are invited for an electrical installation at the Council's isolation hospital, Whilton. The works include a steam engine and dynamo, cable, battery, motor transformer, switchboard, regulating appliances, together with wiring and fittings complete the four blocks of building now erected. Particulars from Mr. William Fairley, Civil Engi-

Digitized by Google

neer, 69 Victoria Street, Westminster, S.W.; or at the office of Mr. Fred W. Pearce, Surveyor to the Council, Town Hall, Twickenham. Fee, two guineas (returnable), and tenders to the Clerk by October 14th.

Miscellaneous

ABERDEEN.—An expenditure of £112 is to be incurred in the provision of lamps and standards for the Culter special lighting district.

AUSTRALIA.—The Melbourne City Council requires 60 direct current flame arc lamps. Particulars from McIlwraith, McEachern & Co., Proprietary, Ltd., Billiter Square Buildings, London, E.C., to whom tenders by October 20th.

BELGIUM.—The "Bulletin Commercial" (Brussels) of September 26th notifies that tenders will be opened at the Bourse de Commerce (Salle de l'Union syndicale), Brussels, at 11 a.m. on October 14th, for the supply of galvanised iron wire, copper wire, cables, rods, screws, ironwork, iron bolts, porcelain insulators &c., &c., for the use of the Belgian Telegraph Administration. The conditions, &c., may be obtained at the Bureau des Adjudications, Rue des Augustins 15, Brussels.

EPSOM.—The Lighting Committee of the Urban Council has included in its draft estimates £300 for the purchase of a new battery. The Engineer has submitted a list of proposed public lighting improvements, estimated to cost £54.

GREAT WESTERN RAILWAY CO.—Tenders are invited for stores, including telegraph instruments, insulators, wires, and cables, electric light carbons, lamps, &c. Specifications, &c., from the Stores Superintendent, London, and tenders by October 20th.

LEEDS.—The construction of the Yeadon and Guiseley tramway is to be proceeded with during the ensuing winter, in addition to the extension from Horsforth to Guiseley.

LONDON: *Islington.*—The electric battery at Highgate Hill Infirmary is defective, and estimates are to be received for 100 to 120 plates.

NORWICH.—Tenders are invited for the supply of two vertical spindle motors with automatic starters, &c., for the Sewerage Committee. Particulars from the City Engineer, and tenders by October 20th.

ROTHERHAM.—The Electrical Engineer has been authorised to lay down additional cable in Doncaster Gate at an estimated cost of £130.

SPAIN.—The "Gacetas de Madrid" announces calls for tenders for working the telephone systems (*a*) of Jerez de la Frontera and (*b*) of the town of Almeria, for a period of 15 years. The concessionaires will be authorised to modify and extend either system, as may be necessary, within a radius of 15 kiloms. Tenders will be received at the Dirección general de Correos y Telégrafos, Madrid, until noon on October 26th for the first contract, and on October 27th for the second. A deposit of 2,000 pesetas will be required in each case. Local represenation is necessary. The "Gacetas," containing further information, may be consulted by British firms interested, on application at the Commercial Intelligence Branch of the Board of Trade.

WHITWORTH.—The Rochdale Corporation have decided to extend their electric car service into the Whitworth district.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations, and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

TENDERS RECEIVED AND ACCEPTED

BLACKBURN.—A contract has been entered into with Messrs. Walter Scott, Ltd., for the supply of permanent way materials for the tramways.

BOGGLESHOLE COLLIERY.—Messrs. James Dunlop & Co., Ltd., have placed an order with Messrs. Johnson & Phillips for the supply and erection of shaft cables.

BURY.—Subject to the sanction of the Local Government Board with regard to borrowing powers, the tender of Messrs. John Musgrave & Sons, of Bolton, for a 2,000-kw. Zoelly turbine, in connection with a Siemens alternator, has been accepted. The Sub-Committee from the Corporation have visited Messrs. Musgrave & Sons' works, and inspected the working of various plants.

DUBLIN.—The tender of Messrs. Babcock & Wilcox for boiler plant and accessories, at £6,423, has been accepted.
The Lighting Committee have provisionally accepted the tender of the General Electric Co., Ltd., for the supply of electricity meters for twelve months.

ERITH.—The tender of Messrs. Mason & Jacob, Ltd., at 16s. 2d. per 1,000 car miles run per annum, on a three years' agreement, for the advertising rights on the tramcars has been accepted.
The tender of the Woodville Electricity Co., for the supply of fire alarm bells to St. Augustine's boys' and girls' departments, and to the Central School, has been accepted by the Education Committee.

HORNSEY.—The Council has accepted the tender of Messrs. Charrington, Sells, Dale & Co., for the supply of Brynteg Welsh coal at £1 0s. 6d. per ton.

HULL.—The tender of Messrs. McMillan & Co. (London), amounting to £568 for the supply of 200 telephone instruments, has been accepted. The tender of Messrs. Bullers, Ltd., for ironwork, in connection with the municipal telephone undertaking, at £60, has been accepted.
The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for a new generating set at the Tramway Power Station has been accepted at £5,926, and for a new condensing plant, that of Messrs. Amos & Smith at £895. The tender of Messrs. Hadfield's Steel Foundry Co. for additional work for tramway extensions has also been accepted at £1,213.

IPSWICH.—The tender of Messrs. Mann, Egerton & Co. for repairs to cable connections from the dynamos to the main switchboard at the workhouse generating station, has been accepted.

LAMBETH.—An agreement has been sealed between the Borough Council and the National Telephone Co., Ltd., for the installation of a public telephone service, in connection with the new Town Hall, depôts, &c. The agreement which sets up a yearly tenancy of a number of telephone lines, provides an unlimited service, and message-rate service, at a total estimate annual rental of £165 10s.

LEEDS.—The Corporation have accepted the tender of Mr. T. W. Matthews for the supply of 2,200 Osram electric lamps for the town hall and municipal buildings. It has been decided to purchase 70 magnets for brakes from the Electric Mechanical Brake and Engineering Co., at £11 10s. each.
A contract has been entered into with the Middleton Estate & Colliery Co., Ltd., for 30,000 yards of cable troughing and covers.
The construction of the Yeadon and Guiseley tramway is to be proceeded with during the ensuing winter, in addition to the extension from Horsforth to Guiseley.

LEYTON.—The question of placing the District Council schools in communication with the fire stations has been considered by the Education Committee, and the following quotations have been received for fitting up fire alarms:—National Telephone Co., £216, for sale outright, or £60 per annum for a term of not less than five years on rental, or £251 10s. for sale outright, each line to run direct from switchboard to instruments instead of being granted, or £68 per annum for a term of five years rental; Messrs. Stuart & Moore, purchase scheme amounting to £434 16s., or hire-purchase scheme at £125 per annum; Messrs. Headland & Headland, telephones to fire stations £393, fire alarms £335, and connecting schools with nearest fire post £210. Having regard to the heavy expense no further action is to be taken.
The Urban District Council having considered prices in existing contracts, together with amended prices, has resolved that contracts for the supply of the following tramway stores be extended until June 30th, 1909, as follows:—Electrical accessories: General Electric Co., Ltd., batteries, wet, 1s. 11d.; electric bells, 4s. 9d.; electric bell gongs, 1s. 3d. Asbestos and insulating material: General Electric Co., Ltd., mica, best clear, insulating, 3s. per lb.; vulcanite fibre 5/16 in. wide, 10d.; vulcanite fibre, ⅛ in., 10d.; voltalac, 9s. Armature repairing materials: General Electric Co., Ltd., linen frame tape, 1 in., 7s. per lb.; linen tape (grey), ½ in., 9s.; British Westinghouse Electric & Manufacturing Co., Ltd., mica cones, 12s. 6d. per lb.; mica cones, 7s. each. Cables and wires: General Electric Co., Ltd., 7/16 cable, £3 12s. per 110 yards; 7/20 cable, £1 10s.; 3/22 cable, 15s. 6d.; electric bell wire, 2s. 3d. Controllers, British Westinghouse Electric & Manufacturing Co., Ltd., fingers 8d. each; contacts drum rings, 1s. 3d.; contacts arcing tips, 4d.; power cylinders, £6 10s.; handles, main drum, 12s.; handles, reverse handle, 4s. 6d.; reverse drums, No. 1, 12s. 9d.; motor cut-outs, No. 2, 12s. Cable connectors, British Westinghouse Electric & Manufacturing Co., Ltd., automatic circuit breakers, £3 3s. each; canopy switches, £1 10s.; resistance boxes, Nos. 1 and 2, £4; resistance boxes, Nos. 3 and 4, £2 5s. Motors, British Westinghouse Electric & Manufacturing Co., Ltd., carbon brushholders, £2 2s. each; pinion wheels, 8s. 6d.; gear wheels, £2 18s. 6d. The Council have accepted the following tenders for materials required for the electrical equipment of the portion of the tramway line in Lea Bridge Road within the area of the L.C.C.:—F. Smith, Manchester, trolley wire, £88 4s. 10d.; Spencer, Ltd., poles, £224 7s.; Dick, Kerr & Co., County Council bases, &c., £70 18s. 8d.; Turners & Manville, insulator bolts, £9 16s. 8d.; Bricknell, Munro & Rogers, span brackets, &c., £32 15s. 6d.; Dennis & Co., span wire, &c., £2 14s. 6d.; W. Wood & Co., hangers and ears, £8 11s.

LOCHGELLY.—The Lochgelly Iron and Coal Co., Ltd., have placed an order with Messrs. Johnson & Phillips, for underground switchgear for their Lochgelly pits.

LONDON: *London County Council.*—The following tenders have been received for electric wiring and fitting of the central car repair depôt:—G. E. Taylor & Co. (accepted), £1,275; Tredegar & Co., £1,319; Pinching & Walton, £1,525; W. Mackie & Co., £1,500; Lund Bros & Co., £1,628; C. Pullan, £1,684; W. E. King, £1,904.
Tenders have also been received for laying stoneware cable ducts, repaving, &c., in connection with the Council's tramways, as follows: J. Mowlem & Co. (accepted), £17,476; Reid Bros., £17,498; Dick, Kerr & Co., £17,904; W. Muirhead & Co., £18,211; J. & A. Ewart, £18,589.
The following tenders have been received for the supply of seven motor-generators for tramways sub-stations: British Westinghouse Electric & Manufacturing Co. (accepted), £11,632; Phœnix Dynamo Manufacturing Co., £12,077; Dick, Kerr & Co., £12,234; General Electric Co., £12,282; Union Electric Co., £12,541; Siemens Bros. Dynamo Works, £13,808; Electric Construction Co., £16,473.
For the supply and erection of high and low tension switchgear for tramway sub-stations, the following tenders have been received:—Johnson & Phillips (accepted), £3,807; Spagnoletti, Ltd., £4,019; Whipp & Bourne, £4,119; Switchgear Co., £4,229; British Westinghouse Electric & Manufacturing Co., £4,301; Ferranti, Ltd., £4,553; General Electric Co., £5,105; Union Electric Co., £5,605.
For the supply of stoneware ducts for the Council's tramways, the following have been received:—Stanley Bros. (accepted), £2,250; Doulton & Co., £2,250; Robinson & Dowler, £2,250; H. R. Mansfield, £2,266; H. Tugby & Co., £2,266; T. Wragg & Sons, £2,400; Gibbs & Canning, £2,450; Donington Sanitary Pipe and Firebrick Co., £2,500; Ensor & Co., £2,500; North Bitchburn Coal Co., £2,800; Sutton & Co., £2,900; J. Stiff & Sons (for 100,000 ducts), £1,170; G. Skey & Co. (for 75,000 ducts), £923; Oates & Green (for 10,000 ducts), £250.
Islington.—A tender of the Medical Supply Co., at £14 14s., for a switchboard and interrupter in connection with the X-ray apparatus at the Highgate Hill infirmary has been accepted. Supply is to be taken from the Borough Council.

Digitized by Google

Woolwich.—The Borough Council has received the following tenders for the supply of cable required for extensions :—

Western Electric Co. (accepted), £1,450. Time for completion, 6 weeks.

Johnson & Phillips, Ltd., £1,468 7s. 6d. Time for completion 7–8 weeks.

W. T. Glover & Co., Ltd., £1,471. Time for completion, 8 weeks.

W. T. Henley's Telegraph Works Co., Ltd., £1,484 10s. Time for completion, 7 weeks.

Siemens Bros. & Co., Ltd., £1,489. Time for completion, 8 weeks.

Callenders Cable & Cons. Co., £1,498 5s. Time for completion, 6 weeks.

British Insulated and Helsby Cables, Ltd., £1,526. Time for completion, 3 weeks.

St. Helen's Cable & Rubber Co., £1,535. Time for completion, 8 weeks.

Sun Electrical Co., Ltd., £1,541 15s. 9d. Time for completion, 8 weeks.

For 110 yards of 3-core ·05 lead sheathed and armoured cable recently required urgently to connect up existing applications and for stock purposes, the following tenders were obtained :—

Callender's Cable & Cons. Co., Ltd. ...	£22	3	9
Western Electric Co. (accepted)	22	3	9
W. T. Henley's Telegraph Works Co., Ltd.	23	1	0
Siemens Bros. & Co., Ltd.	23	10	0

POST OFFICE POWER STATION.—In addition to the tender for generating plant which has been let to Messrs. Willans & Robinson, with Messrs. Dick, Kerr & Co., as sub-contractors, the contract for boilers at the Post Office power station at Blackfriars has been let to the Stirling Boiler Co. There will be seven boilers, three of the land type, and four marine type, each with an evaporative capacity of about 17,500 lb. of water per hour.

ROTHERHAM.—The Electric Light and Tramways Committee has accepted the tender of Jas Cooper, at £127, for the foundations for a turbo-generator.

SALFORD.—The Corporation have, on the recommendation of the Electricity Committee, accepted the tender of the British Insulated & Helsby Cable Co., for the supply of feeder pillars.

WIMBLEDON.—An offer by Messrs. E. Green & Son, to re-erect the economiser at the electricity works for the sum of £21, has been accepted.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5, Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f., quoted on Tuesday night, was £61 15s. to £62 5s. per ton (last week, £62 to £62 10s.).

LEA RECORDERS.—The business of Mr. J. E. Lea, 28 Deansgate, Manchester, will in future be carried on under the style of the Lea Recorder Co.

THE JOHNSON-LUNDELL WORKS.—The manufacturing business of the Johnson-Lundell Electric Traction Co., Ltd., and the freehold factory at Southall, together with plant, machine tools, patterns, drawings, etc., has been purchased by the J. L. Manufacturing Co., Ltd., who will now continue to manufacture under licence the patent "Johnson-Lundell" laminated field motors and dynamos, and will carry on a general electrical engineering business. The new company are now prepared to execute orders on the shortest notice, and hope to be favoured with the support of past customers, and the enquiries of new ones.

NEW AGENCY.—Messrs. E. Lomer & Co., Ltd., 110 Fenchurch Street,, London, E.C., have been appointed sole agents in the United Kingdom by the Brückenbau Flender, A. G., of Benrath, near Düsseldorf, for constructional material of all kinds, bridge work, and steel structures.

NICKEL TUBING.—Messrs. Wm. Geipel & Co., Vulcan Works, St. Thomas Street, S.E., who are sole European agents for Benedict nickel tubing, advise us that improvements have recently been made which enable them to put upon the market a tube having a silvery-white colour which is maintained through the whole of the thickness. This tubing is specially suitable for condenser and cooling apparatus, as well as sanitary, plumbing, and decorative purposes, for which are used at present plated brass and other metal tubes that have the disadvantage that the nickel plating rapidly wears away when cleaned.

PIGGOTT ELECTRICAL CO.—Messrs. G. Piggott & Co., who will in future trade as the Piggott Electrical Co., have removed from 110 Cannon Street, London, E.C., to 24 New Bridge Street, London, E.C. The firm's telephone number is also changed to Holborn 2208.

WIRELESS CLUSTER FITTINGS.—The Benjamin Electric, Ltd., 1A Rosebery Avenue, London, E.C., have brought out a new line of cluster fittings and lighting specialities which cover the grouping idea completely, with a wide range of types and sizes, adapting them for any purpose. The distinguishing feature of these fittings is the "wireless" principle, which eliminates all separate wiring connections to the lamp-holders. The wireless cluster fitting consists primarily of a body shell with detachable back for supporting cluster to stem or attaching direct to surface. Complete lamp-holders of a special design are permanently attached to the body shell. These holders are connected internally by means of conductor rings carrying binding screws for attaching leads from the "live" circuit. Mr. Charles F. Trippe, 36 Brooke Street, Holborn, E.C., is sole agent for the United Kingdom.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—Notice is given of an intended dividend in the bankruptcy of Walter Wardle, electrician, 14 Osborne Road, Levenshulme, Manchester. The last day for receiving proofs is October 17th, and the trustee is Mr. J. G. Gibson, Byrom Street, Manchester.

The first meeting of creditors of the Electrical Instruments Manufacturers, Ltd., of Waltham Cross, Hertfordshire, was held on 2nd inst. at the offices of the Official Receiver, 14 Bedford Row, London, E.C. No statement of affairs had been filed, but it was stated that the unsecured creditors amount to about £1,200, and the assets to £121, but that these latter are covered by debentures. An adjournment was ordered to enable a proper statement of affairs to be filed.

The Gould Storage Battery Co., Ltd., is to be wound up voluntarily. Mr. E. A. Locock, 25 Regent Street, London, W., is liquidator. Particulars of claims by October 31st.
can be used.

NEW COMPANIES

H. T. BOOTHROYD.—This company was registered on October 2nd, with a capital of £16,000 in £1 shares (5,000 preference), to acquire the business of electrical engineers carried on by H. T. Boothroyd as "H. T. Boothroyd, Hyslop & Co.," at Akenside, Bootle. The subscribers are : H. T. Boothroyd, Woodthorpe, Crosby, Lancs., engineer (1 share); Mrs. E. Boothroyd, Woodthorpe, Crosby, Lancs. (1 share). Private company. H. T. Boothroyd is permanent governing director, with £500 per annum. Registered by J. Sykes, 9 King's Bench Walk, Temple, E.C.

DAVIS ELECTRICAL CO.—This company was registered on October 2nd, with a capital of £3.000 in £1 shares (1,000 preference), to acquire the business of manufacturers of and dealers in electric and other lamps and electrical accessories carried on by H. E. Davis at 17 Moor Street, Cambridge Circus, W., and to carry on the same and the business of motor and electrical engineers, &c. The subscribers are : H. E. Davis, 17 Moor Street, Cambridge Circus, W., electrical engineer (1 share); H. N. Howlett, 59 Manor Road, Brockley, S.E., electrical engineer (1 share). Private company. The number of directors is not to be more than three; the first are H. E. Davis (managing director) H. N. Howlett, and C. Levy (chairman). Qualification, £10. Remuneration as fixed by the company. Registered office : 17 Moor Street, Cambridge Circus, W.

PETERBOROUGH CITY GARAGE CO.—This company was registered on October 2nd, with a capital of £2,000 in £1 shares, to acquire the business of motor and motor cycle manufacturers, and motor, electrical, and general engineers, carried on at 14 Lincoln Road Peterborough, and the business of the Peterborough City Garage Co., carried on at 31 Cowgate, Peterborough. Private company. The number of directors is not to be less than two nor more than five; the first are J. Rowe and R. H. Gale. Registered office : 31 Cowgate, Peterborough.

SAN SEBASTIAN DEVELOPMENT SYNDICATE.—This company was registered on September 26th, with a capital of £5.000 in 4,975 ordinary shares of £1 each, and 500 founders' shares of 1s. each, to carry on in Spain or elsewhere the business of hotel, restaurant, café, tavern, beerhouse, refreshment room, and lodging-house keepers, billiard room, music-hall, lecture hall, concert room and ball-room proprietors, licensed victuallers, tobacconists, jobmasters, bath and bathing machine proprietors, laundrymen, hairdressers, agents, printers, publishers, ball and rout furnishers, carriers, suppliers of electric light and power, &c. Private company. The first directors are the Rt. Hon. Lord Suffield, G.C.V.O., K.C.B., the Rt. Hon. Lord Rosmead, Sir Theodore Fry, Bart., Sir Henry E. Dering, Bt., and Major J. Eustace Jameson, J.P. Qualification and remuneration as fixed by the company. Registered office : 15 George Street, Mansion House, E.C.

LAMPLOUGH & SON.—This company was registered on September 28th, with a capital of £2.000 in £1 shares, to carry on the business of mechanical, electrical, and general engineers, machinists, fitters, millwrights, smiths, founders, tyre and rim manufacturers, &c. The subscribers are : F. Lamplough, Mrs. H. Lamplough, L. Lamplough, and T. Cording. Private company. The number of directors is not to be less than two nor more than five; the first are F. Lamplough, Mrs. H. Lamplough, and T. Cording. Qualification, £100. Registered office : Cumberland Park, Willesden Junction, N.W.

NAIROBI ELECTRIC POWER & LIGHTING CO.—Issue on September 9th, of £600, part of series of which particulars have already been filed.

MISCELLANEOUS CITY NOTES

ANGLO-AMERICAN TELEGRAPH CO.—After placing £5,000 to the credit of the renewal fund, the directors have declared an interim dividend for the quarter ended September 30th of 15s. per cent. on the ordinary stock, and £1 10s. per cent. on the preferred stock, less tax, payable on November 2nd. A year ago the dividends were at the same rate.

BRISBANE TRAMWAYS INVESTMENT. The directors have decided on the payment of the following interim dividends on November 2nd, in respect of the profits for the half-year to June 30th :—The usual half-yearly dividend of 2s. 6d. per share on the preference shares, and a dividend of 2s. 6d. per share free of income tax, on the ordinary shares.

CALCUTTA TRAMWAYS CO.—An interim dividend of 2s. per share on the ordinary shares (being at the rate of 4 per cent. per annum, free of tax) has been declared by the directors for the half-year to June 30th.

MBARTON BURGH & COUNTY TRAMWAYS CO.—Subscriptions have been invited during the week to an issue of £80,000 five per cent. debenture stock. The stock will be entitled to the benefit of, and subject to the provisions contained in an agreement and deed of trust dated September 25th and 26th, 1908, between the company and The Realisation and Debenture Corporation of Scotland, Ltd. This deed contains an obligation by the company to pay to the trustees £1,200, being 1½ per cent. on the amount of the stock, annually (first payment being at Whitsunday, 1911), to be increased to the extent of the annual interest upon the amount of stock from time to time redeemed out of the redemption fund thus to be created, and this fund is directed to be applied in redeeming stock, either by drawings at the price of £105 (plus interest) for each £100 of stock, or by purchasing stock at any lower price. The company is entitled to redeem the stock, or any part of it, at any time after three calendar months' notice, and the stock becomes repayable in the event of the company going into voluntary liquidation, whether for reconstruction, amalgamation, or winding up. In both of these cases (viz., repayment by the company, and voluntary liquidation) the stock is to be repaid at the rate of £105 (plus interest) for each £100 of stock.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO.—An interim dividend of 2s. 6d. per share, free of income tax, has been declared for the quarter ended June 30th.

EASTERN TELEGRAPH CO.—An interim dividend of 1¼ per cent. free of income tax, has been declared for the quarter to June 30th.

LANCASHIRE UNITED TRAMWAYS.—The receipts for the week ended September 30th amounted to £1,423, against £1,440 for the corresponding week of 1907.

METROPOLITAN DISTRICT RAILWAY.—Subscriptions were invited up to yesterday morning for an issue of £550,000 four per cent. prior lien debenture stock, part of £750,000 of such stock, authorised by the Metropolitan District Railway Act, 1908.

MEXICAN LIGHT & POWER CO.—A dividend upon the ordinary shares of one per cent. has been declared.

MEXICO TRAMWAYS CO.—A dividend of 4 per cent. per annum for the quarter ended June 30th is recommended.

SHAWINIGAN WATER AND POWER CO.—A dividend of 1 per cent. for the quarter ended September 30th has been declared on the ordinary shares.

SOUTH METROPOLITAN ELECTRIC LIGHT & POWER CO.—Warrants for interest on the 4½ per cent. first mortgage debenture stock for the half-year ended September 30th, 1908 (payable October 1st), have been posted.

COMPANIES' MEETINGS AND REPORTS

CLEVELAND & DURHAM ELECTRIC POWER.—The report for the year ended June 30th states that the depression in trade on the North-East Coast, together with labour disputes, affected the demand for electric power, and at the same time demands for the extension of the company's system necessitated large capital expenditure. Agreements have been made with Waste Heat and Gas Electrical Generating Stations, Ltd., for the operation by the Cleveland and Durham Electric Power, Ltd., of power stations erected by that company at the works of the Weardale Steel, Coal, & Coke Company, at Tudhoe, Spennymoor, and Sir Bernard Samuelson & Co., of Newport, Middlesbrough. Arrangements for bulk supply and extension of the mains system to Hartlepool have been completed, and it has lately been decided to link up this company's cable system with those of the companies further north, and an important extension of mains is now proceeding from the North bank of the River Tees to North-East Durham coalfield. A bulk supply to the Corporation of Middlesbrough was commenced in March last, and important contracts have been closed for supply to four new rolling mills under construction in the Cleveland district. The connections to the company's system aggregate 20,105 horse-power, as compared with 9,172 horse-power connected at June 30th last year. Arrangements have also been made for the connecting up of a further 8,850 horse-power. The net revenue for the year, after writing down preliminary expenses by £10,000, amounts to £5,142, to which is added £3,250 brought forward. In April last an interim dividend of 5 per cent. on the preference shares was paid, and it is now proposed to carry forward to next account the balance of £1,252.

ERNEST SCOTT & MOUNTAIN.—There is a profit of £10,191 for the year to June 30th, 1908. This has been applied as follows :—Interest on debentures, bank charges, &c., £3,520; directors' fees and other charges, £795; depreciation of plant, machinery, and bad and doubtful debts, £5,876.

HENRY BERRY & CO.—There is a gross profit on the working for the year ended August 31st, of £17,985, including £5,861 brought forward. A dividend of 20 per cent. upon the ordinary shares is recommended, carrying forward £4,685. The meeting is on the 14th inst.

MESSRS. WILLANS & ROBINSON.—At the ordinary general meeting held in London on Tuesday, the report and accounts given in our last issue were adopted. Mr. Mark Robinson, who was in the chair, referred to the restriction on the part of municipalities with regard to electrical enterprises, and also to the effect on the electrical manufacturing industry by the use of metal filament lamps. In spite of these conditions, and the continued competition, however, the prosperity of the company had been well maintained. They had a large number of important orders in hand for turbines, whilst the extension of their scope of business by cautiously taking up new classes of work was beginning to show good results. For instance, the Diesel engine was now an element in meeting general charges, whilst condensing plants were also forming an important section of their business. It had been decided that the Queen's Ferry works should not be kept open beyond the autumn this year. The works had been offered for sale on September 16th, but the reserve was not reached, and the directors were convinced that the time had come for drastic measures. There was some discussion as to the advisability of declaring the full dividend upon the ordinary shares, and at the request of Sir G. Clayton East the Chairman put a resolution to the meeting "That no dividend be paid upon the ordinary shares." This was lost, only two voting for it. The motion for the adoption of the report and accounts, with the full dividend upon the ordinary shares be paid, was then put to the meeting and carried.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 1st, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

1907 Patents

20,095. **Motor-Operated Time Limit Switch.** K. Edgcumbe and E. I. Everett. An improvement in the type of time limit switch in which a motor is used, either to close the trip-coil circuit of the circuit-breaker, or to release the tripping mechanism mechanically. Usually the motor works against the force of a spring or weight which is adjustable so as to predetermine the amount of the operating current and of the time to elapse between the instant of overload and the closing of the relay contacts or the releasing of the catch. Since the torque of the motor varies with the current settings, the time will also vary and this renders the adjustment difficult. To overcome this defect the present invention provides for the use of inductive or non-inductive resistances, which may be connected in series with the motor across the secondary of the current transformer. By using these, the same timing scale may be used with different current settings. Three claims, three figures.

25,834. **Insulation of High-Tension Windings of A.C. Machines.** British Thomson-Houston Co. and F. H. Clough. The potential gradient between copper and iron in an armature slot is determined by the same factors as those in the case of the gradient between copper and lead in a lead-covered cable. At a point in the insulation, the potential gradient is inversely proportional to the specific capacity of the insulation at that point. As the usual insulating materials have a specific capacity several times higher than air, and as the fibrous insulation on the conductor itself has a specific capacity approximately the same as air, it follows that the potential gradient may be much higher in the air space and in the fibrous insulation than in the tube. Although the tube may not break down, the electric stress in the air-space and in the fibrous insulation may be sufficient to cause dissociation of the air and the formation of nitric acid which causes corrosion of the insulation. According to the present invention, this defect is overcome by lining the insulating tube with a metallic sheathing in close contact with the inside wall of the tube, and connecting it electrically to one of the conductors. By this arrangement, the whole fall of potential occurs in the insulating tube; and, as the inside air is relieved of practically all electric stress, chemical action will not take place. One claim, one figure.

25,999. **Compound Field Winding for Motors.** Aarhus Dynamo & Elektromotorfabrik and S. P. Johansen. A compound field winding especially adapted for continuous-current motors working cranes or hoists. The poles are wound alternately with shunt and series coils, so connected as to give the proper alternate polarity. The shunt coils are connected in series as a "short shunt" across the armature. A series or wave winding is necessary for the latter. It is claimed that if the resistances are properly proportioned, such a motor can be started under load without any starting resistance, and even suddenly reversed without any resistance being used. When the motor is running light, the current in the series coils will be slight, whereas the shunt current will be relatively strong. Under load the reverse is the case, and it is stated that the relation of the windings may be adjusted so that the speed under load may vary in any required manner. One claim, one figure.

27,412A. **Shunt Coil Protector for Arc Lamps.** H. Bevis and A. E. Angold. A shunt breaking switch for protecting the shunt coil of a shunt or differentially controlled arc lamp. This switch consists of an arm pivoted inside the drum, which carries the carbon suspension chain, the said arm having a lug which extends through the surface of the drum when the chain has been unwound off it. When this happens, another lug on the arm engages a pivoted switch blade and breaks the shunt circuit. On winding back the drum, the arm closes the switch again. By this arrangement it is possible to use a rubbing metal contact switch which is self-cleaning. One claim, two figures.

1908 Patents

811. **Insulation of Wires and Cables.** J. E. Glenister and G. W. Glenister. According to this invention it is proposed to first cover the copper wires of cables with the usual india-rubber sheath, but to substitute for the stranded cotton an outer cover of paper. This outer cover is made of paper threads or strands consisting of narrow strips of paper which are twisted upon themselves so as to form cylindrical threads of any desired diameter; the threads are braided together in the usual way. Two claims.

4,461. **Filaments of the Rare Earths for Electric Lamps.** G. Michaud and E. Delasson. A filament for use in the atmosphere, and composed of a conducting core and a non-conducting outer envelope. This latter, the radiant part of the filament, is formed of alumina and a mixture of the rare earths thoria and ceria; and a binder of black soap is used. The conducting part may be either carbon, tantalum, or any metal of the tantalum group, mixed with a binder of black soap. The former (radiant envelope) mixture is pressed through a nozzle into the shape of a tube which is dried in the flame of an arc. The conducting mixture is forced through the centre of the nozzle into the tube, and is dried at the same time. Five claims, twenty figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

13,724, Mavor & Mavor & Coulson, Ltd. Electrical transmission of power.
20,347, Watson & Smith. Ignition systems.
20,380, Schneider. Electrical clock.
20,592, Rabbidge. Electric batteries or cells.
20,612, Rose. Automatic circuit breaker.
21,073, Siemens Bros. Dynamo Works, Ltd., & Kloss. Windings of dynamo-electric machines.
21,651, Marconi's Wireless Telegraph Co. & Young. Receivers.
22,485, Simpson. Coin-freed meters.
23,915, British Thomson-Houston Co. (*General Electric Co., U.S.A.*). Motor controllers.
25,116, British Thomson-Houston Co. (*General Electric Co., U.S.A.*). Dynamo-electric machines.
25,772, Stevens. Means of paralleling the motors of electric and petrol electric cars.
26,195, Petch, Duncan, & King. Electric order telegraphs.
26,399, Pullan. Compound tramway rails.
26,711, Klauser (*Geb. Gierse*). Spanner for insulators.
28,004, Siemens Bros. Dynamo Works, Ltd., & Grimston. Search lights.
28,435, Gardiner. Electric railway signalling system.

1908 Patents

136, Entwistle. Electric lamp and shade holders.
1,250, Jensen (*Jeffrey*). Electrically-driven mining machines.
2,046, Mavor & Mavor & Coulson, Ltd. Means for damping the rolling of ships.
3,670, Fairweather (*Shepherd*). Alarm signalling system.
4,391, Child. Photophonic means for use in telephonic transmission, and production of photographic records.
4,940, D'Varad & Meislinger-Meszlényi. Manufacture of positive storage battery plates.
5,728, Fairburn-Hart (*Electrelle Co.*). Automatic musical instruments.
7,495, Fessenden. Telephonic transmitters or relays.
7,664, Fraser & Chalmers, Ltd., and Whitmore. Safety devices for hoisting apparatus.
8,133, Siemens Bros. Dynamo Works, Ltd., & Kieffer. Fixing commutators.
9,800, Chisholm. Electro-magnetic sound-recording apparatus.
10,184, Buckton. Combined plugs, sockets, and switches.
11,099, Hamilton. Apparatus for transmitting telegraphic signals.
11,128, Hankin, Electric heating apparatus.
13,730, Kitsee. Telegraphy.
16,028, Hutton. Appliances for preventing the overhearing of telephone conversations.
16,136, Harrison & Burns. Electric insulating shield for use by linemen.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

6,029, Company Bismarckhütte. Refining of steel in electric furnaces.
10,626, Anders. Electrical driving devices for clocks.
17,350, Siemens & Halske Akt.-Ges. Process for improving the ductility of tungsten.
18,430, Fessenden. Apparatus for producing high-frequency electric oscillations.
18,500, Wagner. Railway signalling systems.
18,579, Rateau. System of governing low-pressure turbines driving generators coupled in parallel.
19,169, Glühlampenwerk Anker Ges. Process for packing metal filaments.
19,201, Hanl & Waldau. Sparking-plug.
19,263, Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. Insulating process for electrical machines.

INTERNATIONAL CONFERENCE ON ELECTRICAL UNITS AND STANDARDS

ON the invitation of the British Government, an International Conference on Electrical Units and Standards will, as already announced, be held in London at the rooms of the Royal Society during October. Eighteen countries are sending delegates to the Conference, the names being given below.

The first meeting of the Conference will be held on Monday next, October 12th, at 11.30 a.m., when the delegates will be received by the President of the Board of Trade. In the evening there will be a reception by the Royal Society. The meetings of the Conference are expected to last until October 22nd, but this date is not fixed, as it will entirely depend on the progress made with the work at the Conference.

The main object of the Conference is to obtain International agreement on the three electrical units, the Ohm, the Ampere, and the Volt, so that the realisation of these units in all the countries of the world shall be as near as possible identical. The best method of setting up the Mercury Ohm, the Silver Voltameter, and Cadmium Cell will be considered, and it is hoped that detailed specifications may be issued with the authority of the Conference.

The delegates will be entertained at an official banquet, and will lunch with the Lord Mayor; they will also make an excursion to Cambridge on the invitation of Trinity College, and pay a visit to the Cavendish Laboratory. The Board of Trade Government Standards Laboratory will be open to inspection by the delegates, and the National Physical Laboratory at Teddington will be visited. The delegates will also dine at the Franco-British Exhibition with the "Dynamicables" on Wednesday, October 14th, and are invited to the annual dinner of the Institution of Electrical Engineers on Thursday, October 22nd.

LIST OF DELEGATES.

Belgium.—Monsieur Gérard, Director of the Montefiore Electro-technical Institution and President of the Consultative Commission on Electricity; Monsieur Clément, Secretary of the Consultative Commission on Electricity.

Denmark and Sweden.—Professor S. A. Arrhenius, Nobel Institute, Stockholm.

Ecuador.—Señor Don Celso Nevares, Consul-General.

France.—Monsieur Lippmann, Member of the Institute and Professor at the Sorbonne.

Germany.—Dr. Warburg, President of the Imperial Physico-Technical Institute; Dr. Jaeger, Member of the Imperial Physico-Technical Institute; Dr. Lindeck, Member of the Imperial Physico-Technical Institute.

Great Britain.—The Rt. Hon. Lord Rayleigh, President of the Royal Society; Prof. J. J. Thomson, F.R.S.; Sir John Gavey, C.B.; Dr. R. T. Glazebrook, F.R.S.; Director of the National Physical Laboratory; Major W. A. J. O'Meara, C.M.G., Engineer-in-Chief, General Post Office; Mr. A. P. Trotter, Electrical Adviser to the Board of Trade.

Guatemala.—Dr. Francisco de Arce, Diplomatic Representative, London and Paris.

Italy.—Professor Antonio Roiti, of Florence.

Japan.—Mr. Osuko Asano, Doctor of Engineering, Official Expert of the Department of Communication, Tokyo; Mr. Shigeru Kondo, Official Expert of the Department of Communication, Tokyo.

Mexico.—Don Alfonso Castello, Don Jose Maria Perez.

Netherlands.—Dr. H. Haga, Professor at the University, Groningen.

Paraguay.—M. Maximo Groskey.

Spain.—Don Jose Maria Madariaga, Professor of Electricity and Physics at the School of Mines, Madrid.

Switzerland.—Dr. F. Weber, Professor of the Swiss Polytechnic school at Zurich; Dr. Pierre Chappuis, of Bale; Dr. J. Laudry, Professor of Electricity in the School of Engineers, Lausanne.

United States.—Dr. Henry S. Carhart, Professor of Physics at the University of Michigan; Dr. S. W. Stratton, Director, Bureau of Standards, Washington; Dr. E. B. Rosa, Physicist, Bureau of Standards, Washington.

Australia.—Mr. Cecil Darley, Prof. Threlfall.

Canada.—Mr. Ormond Higman, Chief Electrical Engineer, Inland Revenue, Ottawa.

Crown Colonies.—Major P. Cardew, Electrical Adviser.

India.—Mr. M. G. Simpson, Electrician of the Indian Telegraph Department.

Berlin Underground Railway.—The new underground section of the Berlin Elevated and Underground Railway was opened on Thursday, the section extending from the power terminus at the Potsdamer-Platz to the Spittelmarkt, which is in the centre of the city. There are three stations on the new line, which has been laid as a shallow surface railway, and is reached by short flights of stairs. Further extensions to the north and north-west are contemplated.

Obituary.—The death is announced of Mr. William Trotter, J.P., a director of the United Electric Tramways of Montevideo.

CATALOGUES AND PAMPHLETS RECEIVED

ALTERNATING-CURRENT METERS.—An extensive new list has been published by Messrs. Ferranti, Ltd., of alternating-current meters. These are of the induction type of simple and robust construction. Very clear illustrations and descriptions of the various parts are given. The load current passes through series coils, wound-wave or lap-winding in the slots of an iron armature. The shunt current passes through the shunt coil wound on a bobbin placed on the iron core of a separate system. The magnetism due to the load current is practically in phase with the load current, but the magnetism acting upon the disc, due to the shunt current, lags 90° behind the E.M.F. impressed upon the terminals of the shunt coil. The interaction of these two magnetic fluxes causes an aluminium disc to rotate as in a two-phase induction motor. The driving torque is strictly proportional to the watts passing through the meter, and a retarding torque proportional to the speed of rotation is provided by a permanent magnet in the usual way. The moving part weighs 23 grammes, and the torque at full load is 2-gramme centimetres. The integrating gear is of the cyclometer type, specially arranged so that the change-over of figures does not throw any load on the meter. The list gives full instructions for testing and adjusting, and the installation and connecting-up of single-phase two-wire and three-wire meters, and polyphase meters, and some views are given of the meter departments of the Holinwood works. These meters have the official approval of the Board of Trade, and every meter is calibrated at the works to the following limits of accuracy:—1½ per cent. from $\frac{1}{10}$th to full load, and 2½ per cent. from $\frac{1}{20}$th to $\frac{1}{10}$th load; the accuracy is stated not to be affected by a short circuit through a fuse of double the capacity of the meter.

ARC LAMP CARBONS.—A price sheet is to hand from the Union Electric Co., of carbons for use with excello and other patterns of flame arc lamp. Among the advantages claimed for carbons of this make are the regularity of mechanical construction, the high efficiency and regular illumination obtainable, and the low resistance secured by the metal cores.

ELECTRICAL ACCESSORIES.—A new catalogue of electrical accessories has been issued by Simplex Conduits, Ltd. Several patterns of the firm's tumbler switch, with laminated brush contacts, are included, both of the surface and flush types. Other branch switches are the rectangular sliding lever switch, and a turn switch of very low projection. Other special switches include "pear" switches for flexible cords, and a push-button switch. Other items in the list are ceiling roses, counter-weights, wall sockets, and plugs, lamp-holders, adapters, and a few simple fittings. A novelty is the simplex electric candle, in which an elongated lamp with the filament at one end is used and the opal tube is slipped over this. This tube has an outer glass bulb at its upper end which fits over the lamp itself. The whole fits into an ordinary lamp-holder and not only has a remarkably good effect of soft lighting, but always remains upright in the fitting.

ELECTRIC HAULAGE GEARS.—A new pamphlet from the Electric Construction Co. deals with a series of standard designs of electric haulage gears for underground work. These are specially constructed to withstand the arduous conditions of mining work for alternating and direct current, in sizes ranging from 25 to 100 B.H.P., arranged either for endless rope, main and tail haulage or with single drum.

GILBERT ARC LAMPS.—Particulars of the three types of lamp made by the Gilbert Arc Lamp Co., Ltd., of Chingford, are given in a pamphlet just issued. These are the four converging type, the two converging type, and the magazine type. A patent has been applied for for a new "feeding" mechanism, by which it is claimed that it is impossible to "overfeed," as with a brake wheel or clutch, or even clockwork.

LEAKAGE INDICATORS.—Messrs. Everett Edgcumbe & Co., Ltd., have sent us an advance copy of a new pamphlet which they are getting out on leakage indicators. The present pamphlet refers to instruments for low-tension networks, but it is made very clear that a different kind of instrument is required for each different type of network, and the various cases are all mentioned. One of the most frequent applications of these leakage indicators is for mining installations. In Clause 6 of the Home Office regulations for installation and use of electricity in mining, it is stated that the installation of every complete circuit, other than telephone or signal wires, used for the supply of energy shall be so maintained that the leakage shall, so far as is reasonably practicable, not exceed one-thousandth of the maximum supply current, and suitable means shall be provided for the immediate localisation of a leakage. Clause 7 states that earth or fault detectors are to be connected up to show immediately any defect in the insulation, and that readings of these instruments will be recorded daily in a log-book. In the apparatus supplied for D.C. two-wire systems with mains completely insulated, there is a three-way switch, and when this is in the normal position the pointer stands at zero so long as the insulation is perfect, and it deflects to the right or left when there is a fault. The instrument is then being used as the fault detector required under Clause 7 cited above. A daily test to ascertain if the insulation of the system is up to the standard required in the Clause 6 is taken by moving the switch in turn to the other

Digitized by Google

two positions and taking a reading, and from these two readings both the insulation resistance of, and the leakage current from, each main is ascertained by reference to a table supplied with the instrument. Modified instruments are made for three-wire systems with and without permanently earthed middle wires, and other patterns of instruments are supplied for three-phase networks, both three-wire and four-wire, and also for single-phase systems. Messrs. Everett, Edgcumbe & Co. have evidently made a very complete study of the subject of leakage indicators, and we recommend our readers to read this pamphlet carefully before ordering.

SIMPLEX CONDUITS.—An attractively prepared list dealing with the well-known Simplex conduits has been sent us by Simplex Conduits, Ltd. Special attention should be drawn to the material reductions which have been made in the prices of both conduits and fittings, frequently amounting to 20 per cent. or more, although the firm assures its customers that these reductions have not been made at the expense of quality. Another feature of the list is the pricing of galvanised material, which the firm has been led to introduce by the increasing tendency towards the use of higher class material in installation work. This conduit, &c., is offered at but a small percentage increase on the cost of ordinary enamelled. Large extensions are being carried out at Garrison Lane Works, Birmingham, and at various branches in different parts of the country.

STEAM TURBINES.—A handsome illustrated catalogue has just been issued by Messrs. John Musgrave & Sons, Ltd., of Bolton, dealing with the Zoelly steam turbine which they manufacture in this country under license from the inventor. We recently described and illustrated a fine example of these machines which the firm have erected at the Falcon Spinning Mill (Electrical Engineering, September 24th, page 459). The chief feature of the Zoelly turbine is that, as it is purely an impulse, large clearances can be employed both axially and radially. The catalogue contains a full illustrated description of the working and construction of the turbine, showing the great mechanical solidity of the blading and the arrangement of governor adopted. Tables are given of dimensions, weights, and guarantee steam consumptions of standard from 50 to 10,000 B.H.P., and particulars are given of exhaust steam and mixed pressure machines. A number of excellent illustrations of actual installations are included, and a useful feature of the catalogue is a collection of tables of the properties system and other engineering quantities

SMALL TRANSFORMERS.—The Union Electric Co. are issuing a new list of small transformers for use with low-voltage metal filament lamps running at ordinary alternating supply circuits and for arc lamps. The transformers are suitable from 40 to 100~ per second, and have secondary ampere ratings in the case of arc lamps up to 30 amperes, and in the case of metallic filament lamps up to 80 amperes. The transformers are roughly divisible into two main classes, viz., with single-circuit secondaries and with multiple-circuit secondaries. Care has been taken in the design to secure high efficiency on load and low no-load losses, and the method of winding ensures that the variation of voltage on the secondary circuit is a minimum.

THE HELION LAMP

On more than one occasion we have referred to the high efficiency lamp developed in America by Messrs. H. C. Parker and W. G. Clark, and known as the Helion lamp. (Electrical Engineering, Vol. I., p. 213, and July 9th, p. 69.) Some further particulars relating to the lamp, which, it will be remembered, has a filament made from a preparation containing silicon, are given in a recent article by the inventors in the *Electrical World* (New York).

The first Helion filaments on which a satisfactory life was secured, and which were exhibited early in 1907, were extremely sensitive to the slightest trace of gas in the lamp bulb. It was extremely difficult to exhaust the bulbs to the necessarily high vacuum, and if the lamps were burned with only a slight trace of gas in the bulbs, in the course of time there was set up between two points of the filament near the terminals a cathode discharge, which would burn out the filaments near one of the leading-in wires.

The gas which caused trouble was that contained in the cement, and which it was very difficult to remove, but after experimenting with a great many cements of widely different composition, by a method of elimination, one was secured best suited to the purpose. The development of vacuum apparatus was also carried out to the point which the characteristics of the filament demanded, but, realising the difficulties entailed in making such a process commercial, a series of experiments was started on the filament in an endeavour to reduce its sensitiveness to the presence of gas, so that it might be used in a vacuum at a slightly higher pressure than that at which the cathode rays started.

Much attention has also been devoted to obtaining filaments of uniform composition and standardising methods under which they were produced, and it is only recently that it could be said with certainty that invariable results were obtained. That the filament has been rendered less sensitive to the presence of gas is evidenced by the fact that it may now be operated at a specific consumption of from 2·5 to 4 watts per candle in the open air without any enclosing glassware whatever. Where the heat is retained by reducing the convection current, the efficiency increases very rapidly and the filament exhibits many interesting physical properties, in some instances differing from the original Helion filament.

It has been necessary to conduct almost countless experiments to determine the cement best suited to the requirements, the degree of vacuum to which the globes should be exhausted to obtain the best results, the particular gas in which the filament operates most satisfactorily, the character of the surface of the filament by which the highest efficiency is obtained, the ratio of core diameter to diameter of finished filament, and a vast number of experiments on commercialising the methods pursued. Filaments are now produced having a much higher resistivity than the original filaments, so that either 110-volt or 220-volt filaments can be constructed in a single loop of moderate length and comparatively great cross-section.

A most striking property of the filament is its wonderful resistance to oxidisation. It may be maintained at a bright incandescence for many hours without deterioration at a temperature aproximating 1800 deg. C. When atmospheric dust is kept away from the filament there appears to be no surface change whatever, but particles of dust in the atmosphere coming in contact with the hot filament are fused and stick to it, so that in the course of time the filament begins to show excrescences, the rate at which this accumulation is acquired being dependent entirely upon the amount of dust coming in contact with the filament. After burning for a number of hours in air a slight progressional change in the luminosity of the filament appears at one terminal and gradually continues around the entire length. This has been found to be due to the burning out of the carbon core on which the filament is formed. As the core burns out the tube remaining is a tube of the pure Helion composition, and, as the only portion of core exposed is the end within this tube, the rate of oxidisation is very slow, but when the carbon core is entirely burned out the conductivity of the filament is decreased by an amount equal to the original conductivity of the carbon core. This effect can be prevented by sealing the terminals of the filament to prevent oxidisation. When this is done the filament will operate in air for many hundreds if not thousands of hours.

When the temperature of the filament is raised sufficiently high—about 2500 deg. C.—the silicon on the surface of the filament combines with the oxygen of the air and burns off, forming silicon dioxide, which may be collected by holding a glass plate over the filament when the burning takes place. This burning off does not destroy the filament, but only increases its resistance by the amount of material removed from the surface; upon again raising the temperature by increasing the potential applied, the surface may again be burned off, and this may be repeated a number of times before the filament is destroyed. If the incandescent filament is plunged in water there is no apparent effect on the filament other than the cooling down produced by the water, and it is possible to cut through pieces of glass by allowing the filament to melt its way through the glass, which it does without any apparent injury to the filament.

An interesting property of the filament is its high specific resistance, which is nearly 50 times that of the carbon filament and several hundred times that of tungsten. The filament is also very hard, it being possible to scratch glass with small particles of it under the thumb-nail. When operating the filament in air great difficulty was encountered in obtaining a cement which would resist oxidisation, but a metallic cement which appears to be entirely satisfactory for this purpose has been developed. A heating at the negative terminal, probably due to the thermo-electric action between the cement and the filament, was the troublesome point, but this has been overcome by the use of a combination of materials which balanced the thermo-electric action.

A most unexpected phenomenon was observed when the new filaments were mounted in a high vacuum and operated at a high temperature; although the filament gave no indications of softening at even the highest temperatures, the globes would suddenly become coated with a most beautiful mirror, which analysis showed to be pure silicon, due to an intense ionisation. This action was overcome, however, by giving the filament a slight coating of another material, which entirely prevented the ionisation. Further experiments along this line are being conducted at present, and the results are extremely promising.

Metal Filament Lamps.

THE "METALIK"

THE BEST 200-250 VOLT LAMP

Please write for particulars of the SPECIAL DISCOUNTS we have arranged for CORPORATIONS and the TRADE.

Messrs. G. M. BODDY & Co.,
Newington Works, LIVERPOOL. *June 23rd, 1908.*

Dear Sirs,

Answering your last letter we can tell you that the lamp No. 3 is now burning **3,170** hours and is still in good condition (sloping position, alternating current, 220 volts). As we have not made any photometric test on this lamp we cannot say exactly how many per cent. the candle power decreased, but we do not think it is much.

We remain, dear Sirs,
Yours truly,
.....*Manager, Electricity Works.*

The originals of the following letters are in the hands of the Editor of "ELECTRICAL ENGINEERING."

Messrs. G. M. Boddy & Co.,
Liverpool. *June 6th*, 1908.

Dear Sirs,

In reply to your letter of the 4th inst., we beg to inform you that we tested three "METALIK" lamps 220 volt, 50 c.p. in a sloping position burning with alternating current. These lamps were burning continually without switching in and out more than about once every 100 hours. The life of the first lamp was 970 hours, of the second 1,856 hours, while the **third lamp is already burning 2,775 hours,** and is *still in good condition.* The light of the lamps is not materially less than as they were new. The blackening of these lamps is practically so slight that we may say there is no blackening.

Electricity Offices
Messrs. G. M. Boddy & Co., *March 9th*, 1908.
Liverpool.

Dear Sirs,

Some time ago we had two samples 50 c.p. "METALIK" Lamps from you for testing purposes. These lamps have an average life of 1,407 hours, and would have run longer had not the filaments become shorted by twisting.

We shall be glad to have your best price for the supply and delivery carriage paid at our .....Stores of "METALIK" lamps in the 32 c.p. size suitable for series burning on a 230 volt direct current circuit.

Yours faithfully,
.....*City Electrical Engineer.*

Corporation Electricity Works,
Messrs. G. M. Boddy & Co., ..., *May 28th*, 1908.
Liverpool.

Dear Sirs,

In reply to yours of the 27th inst., so far your "METALIK" lamps have been burning very satisfactorily and shall be obliged if you will quote me your best price for 100 lamps, as we shall probably be wanting some more before long. Yours faithfully,
.....*City Electrical Engineer.*

THE MANCHESTER ELECTRICAL EXHIBITION OF 1908

(SECOND NOTICE.)

THE Electrical Exhibition at Manchester was opened to the public on Saturday last, on which day representatives of the technical and lay Press were invited to inspect it. Throughout the day, and especially in the evening, there was a large attendance. The total number of visitors who paid for admission was between 2,500 and 3,000, in spite of a large number of tickets having been sent out by the Manchester and Salford Corporations. In view of the fact that there was a formal "opening" by the Lord Mayor of Manchester on Monday, the large number of visitors on the first day was somewhat of a surprise, but it may be accounted for by the fact that the members of the public, who attended earlier in the day, found that the exhibits were almost completed, and when this became known the numbers swelled considerably towards evening. Up to a late hour on Friday there was a large amount to do at practically every stand to bring the exhibits to a state of completion, and it is a compliment to the Press that exhibitors and their staffs worked with a will up to the small hours of Saturday morning in order to finish their displays of machinery and apparatus. Particular mention must be made of the ungrudging help of the staff of the Manchester Corporation electricity department, led by Mr. S. L. Pearce, the engineer-in-chief, who all worked unremittedly during the night testing and connecting up the exhibitors' installations as soon as they were ready. Owing to the intentional exclusion of daylight practically all the stands—a total of nearly 300—were electrically lighted, and a large proportion also utilised electric power, so that the task was no light one, and it is satisfactory to note that this enormous mass of temporary wiring work was joined up to the Corporation sub-station in the exhibition without any serious hitch well up to time. It was inevitable that there should be a few cases in which the installations were not sufficiently complete to be supplied with current, but these were so scarce as not to be noticeable among the lines of completed exhibits.

THE OPENING CEREMONY.

Apparently no exhibition is considered complete without an opening ceremony, and on this occasion it was certainly no more than a formality, as the Exhibition had been very effectively opened to the public on Saturday without the personal assistance of the Lord Mayor of Manchester, who, after an hour's inspection of the exhibits on Monday, slipped on his chain of office and declared the Exhibition open, expressing at the same time a hope that the development of the electrical industry would assist to bring about a solution of the problem of the unemployed.

The function was welcome, however, as enabling the Exhibition Committee to show some hospitality to the Mayors of those Corporations who had contributed to the funds of the Exhibition, and the restricted space in the dining hall was subsequently taxed to the utmost. Several of the Mayors were accompanied by their Borough Electrical Engineers, who, needless to say, were made very welcome at the exhibitors' stands which they visited both before and after the inaugural luncheon.

The Lord Mayor of Manchester (Alderman Holt), responding to the toast of the Corporations of Manchester and Salford, and the other local authorities represented—proposed by Mr. Walter Musgrave—said that Manchester was the largest producer of electricity in the United Kingdom. He thought that the extended application of electricity would mean a large reduction in working expenses for the various trades of Manchester, but the present moment was, perhaps, not an opportune one for the Lord Mayor of Manchester to express himself in love with labour-saving machinery. Nevertheless, it was necessary to use such means to reduce the cost of manufacture in order that we might compete successfully with other European countries. Finally, he expressed the view that every large town should hold an electrical exhibition once a year, and he referred to the advisability of retaining open spaces near the large towns for such purposes.

Other speakers were Mr. Walter Musgrave, Sir William Stephens, and Mr. William Kay (chairman of the Executive Committee of the Exhibition and deputy chairman of the Manchester Electricity Committee). Mr. Kay, in his speech, paid a tribute to the good work done by the staff of the Manchester Electricity Department, particularly Mr. S. L. Pearce, the engineer-in-chief, to whose assistance the instantaneous success of the exhibition has been largely due.

SOME OF THE EXHIBITS

THE MODEL HOME

Equipped by Messrs. Goodalls, Messrs. Drake & Gorham, the General Electric Co., Messrs. Elkington & Co., Ltd., the Harper Electric Piano Co., Ltd., &c. (Stand No. 163.)

The Model Home is a miniature house which has been built to demonstrate the various ways in which the applications of electricity can minister to domestic comfort, luxury, and cleanliness. Built by Messrs. Goodalls, of Manchester, in the bungalow style, in one story, of rough cast, painted white, and covered with trellis-work, it has a very effective appearance with its red-tiled roof, overhanging door, and canopy surmounted with the heraldic device of former owners of Platt Hall. The visitor enters by an automatic Sesamé door, which opens of itself when he steps upon the mat and closes quietly when he steps off. The hall is furnished in dark oak, and lighted from a hammered-metal electric chandelier in the centre. An electric radiator is provided in the fireplace. On the left is the dining-room, oak panelled in the Tudor style, with furniture chiefly in the Sheraton manner. The lighting is entirely from handsome silver-plate candle fittings, supplied by Messrs. Elkington, including a magnificent 16-light hanging chandelier in the centre, and the various candelabra on the dining-table and about the room. Those on the table, which is shown completely laid for dinner, include two for three lights and one four lights, standing on one of Messrs. Drake & Gorham's electric table-cloths, with which contact can be made at any point by two small pins. As in all the other rooms, electric heaters are provided. The drawing-room on the other side of the hall is in the later English Renaissance style of William and Mary, and it is pleasant to think that electric lighting has made such delicate and harmonious decorative schemes possible. The lighting here again is principally from tasteful candle fittings, and we notice here, as in the other rooms, simple, unobtrusive flush switches are used. A Harper electric piano stands in the corner of the room. The bedroom is equally restful, and in the simpler styles of the eighteenth century. Beautifully soft general lighting is obtained from a centre pendant, with the lamps contained in an obscured glass dish. The dressing-table is lighted by a pair of handsome candelabra, and at each side of the bed are arrangements of plugs for table lamps and switches on flexible cords. The electric heating appliances include the usual radiator, a warming pan, a shaving pot, and a curling-iron heater with automatic switch, which cuts off the current when the iron is withdrawn. One of the most interesting parts of the home is the kitchen, equipped by the General Electric Co., but a full description of this must be deferred until it is complete. It may be said, however, that the cooking equipment is designed to cook a full

Digitized by Google

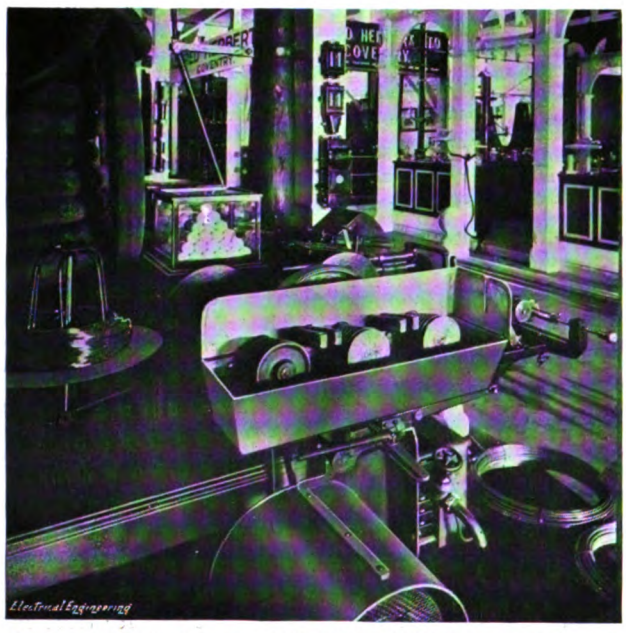
dinner for eight or ten persons at a cost of current (at 1d. per unit) of 4¾d., and a first cost complete of £18 10s.

The house is wired with Messrs. Drake & Gorham's system of grip conduit, in which ordinary unscrewed tube is slipped through the half-couplings, flanged by a special tool and coupled up. The lighting is entirely by 25-volt Osram lamps, and the supply is from the extremely compact generating plant on Messrs. Drake & Gorham's stand adjoining. This consists of a 3-h.p. single cylinder horizontal running on paraffin, but starting on petrol, direct coupled to a shunt-wound dynamo for 25 to 40 volts, used in conjunction with a 14-cell battery by the D.P. Battery Co., of 360 ampere hours' capacity on the six-hour rate.

British Insulated & Helsby Cables, Ltd.,

Prescot, Lancashire. (Stand Nos. 28 & 41.)

Wire-drawing Machine.—This wire-drawing machine is shown in actual operation, and is one of the most interesting specimens of running machinery at the Exhibition. It is what is known as a "17-die cone machine," and has diamond dies. Those who are accustomed to the old style of wire-drawing machines will wonder at its extreme compactness, and also at the high speed at which it runs. The wire is drawn consecutively through the 17 diamond dies, and gradually reduced in size and extended in length. The machine is capable of drawing down copper wire in one process from 0·0084 in. in diameter to 0·0018 in., but in running at the Exhibition the machine is only shown drawing down the wire from 0·004 in. in diameter to 0·0018 in. It is run by a one horse-power motor from the 200-volt D.C. mains. The wire passes backwards and forwards over the "cones" clearly seen in the illustration, and is wound up automatically on a spool at the end of the machine after passing through the last die.

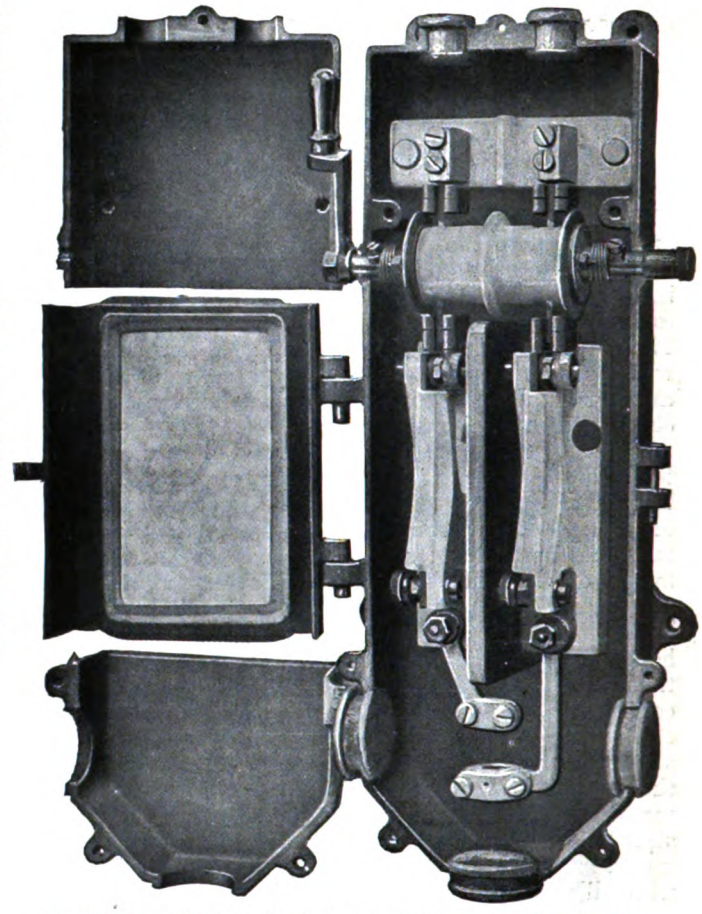


17-Cone Wire Drawing Machine (British Insulated and Helsby Cables, Ltd.).

House-Service Boxes.—A very representative collection of these is on view. One of the most interesting types is that known as the "Barrow" combined switch and fuse box, which was made to the design of Mr. Burnett, Borough Electrical Engineer of Barrow-in-Furness. As seen in the illustration in the next column, a novel feature is the construction of the switch, the body of which consists of a porcelain drum through which the switch blades pass. The spindle upon which the switch rotates is extended at each side of the cast-iron box, so that the handle for turning may be fixed on either side.

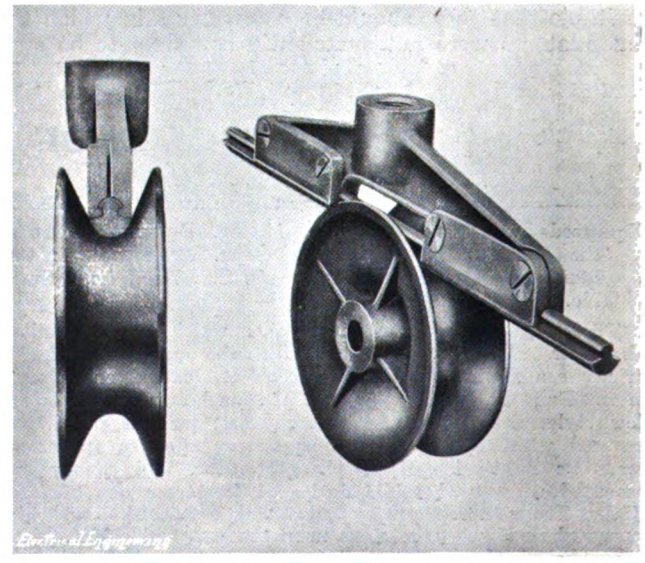
Overhead Tramway Gear.—The company has recently been developing its "non-fouling" trolley wire and fittings. The feature of this wire is that it is a modified "figure of eight" section. As will be seen from the illustration below, the top part of the wire above the groove is considerably smaller than the lower half, and the ear is arranged so that it does not project beyond the wire. Various fittings for use on this wire are shown, including the Carty section insulator adapted for use with it, as used on the Newcastle trams.

Other Exhibits.—Among the large collection of other fittings which the British Insulated & Helsby Cables Co. show is a section of an overhead power transmission line for 20,000 volts three-phase, as supplied and erected by the company in various



"Barrow" Type Switch and Fuse Box made by the British Insulated and Helsby Cables, Ltd.

parts of the world. To demonstrate the difference in size between copper and aluminium wire, two of the wires on this are of copper and one of aluminium of equivalent sections, the diameters being respectively 0·372 in. and 0·480 in. A 360 lb. copper ingot, which is lying in a prominent position on the



"Non-fouling" Wire and Mechanical Ear.

stand, is longer than is customary for use in copper rolling mills, as a longer length is desirable when rolling heavy troiley wire. This is rolled to ¼ in. diameter in the company's rolling-mill plant, passing through the rolls about 20 times. This brings it down to ¼ in. diameter, and coils of the black and

Digitized by Google

"pickled" half-inch rod are exhibited. The rod is then drawn down to wire in the wire-drawing machines. Some particularly well-finished switches, plugs, and other fittings made for the Admiralty are also on view, and a large exhibit of telephone plant, a description of which will be reserved for a future issue.

The British Thomson-Houston Co., Ltd.,

RUGBY. (STAND NOS. 48, 49, & 50.)

Horizontal Curtis Turbo-alternator.—The most interesting exhibit of the British Thomson-Houston Co. is a complete generating set, consisting of the first horizontal Curtis turbine to be manufactured in this country, coupled to a 1,000 kw. three-phase alternator for 2,600 volts 50 cycles, and designed to run at 3,000 r.p.m. We hope to be able to give some further details of this interesting set at a later date, but may remark that it is remarkably compact, as the overall dimensions are only 16 ft. by 6 ft. The turbine is of the two-stage type, with five rows of blades, and the blading is of an entirely different construction from that in the older vertical form of Curtis turbine in that separate blades are employed, dovetailed by a special method into the rotor discs instead of being machined out of the solid. An important point in the design is that the bearings can be placed very close together, and the shaft kept very short and consequently rigid. One of the bearings is a thrust bearing, but the function of this is principally to prevent end play, as the thrust is almost entirely balanced by the action of the steam. The governing is on the same principle as employed in the vertical designs, and is effected primarily by shutting off a varying number of the six main nozzles by valves operated by water or oil pressure. A further auxiliary nozzle is provided on which a fine adjustment can be obtained by throttling, and this alone is open at times of very light load. A point that may be mentioned with regard to the alternator is that the ventilation is from the exciter end, so that hot air from the turbine cannot enter the machine.

Metal-filament lamps.—A good deal of attention will also be directed to the new B.T.-H. tungsten lamp made at Rugby, which is shown in the following sizes :—40 c.p. for 100-125 volts, 16 c.p. for 50 volts, and 10 and 16 c.p. for 25 volts. The 40 c.p. takes 50 watts, giving an "efficiency" of 1·25 watts per British mean horizontal candle-power. It is claimed that the method of manufacture of the filaments, in which a mercury amalgam is used as a binder instead of a mucillaginous compound, gives a filament of much greater uniformity and tensile strength. An improved method of support, in which the filament is constantly held taut by springs, is therefore possible, with the result that not only are the lamps much less liable to damage in transport, but the spring will take up expansion, so that the lamps can be run in any position without liability of the filaments to sag.

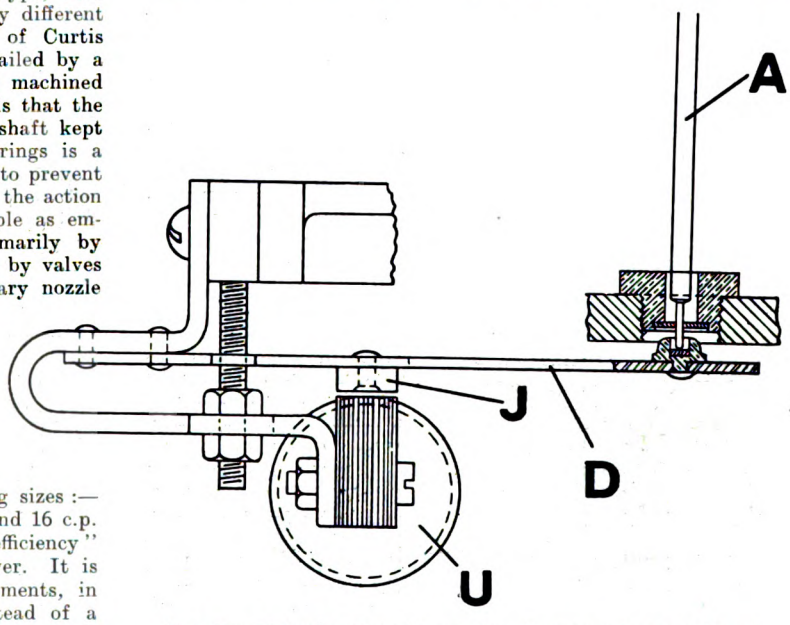
Driving of Textile Machinery.—The company have paid a great deal of attention to the requirements of driving of textile machinery, and the systems they have developed are exemplified by a complete ring-spinning frame with 52 spindles by Messrs. Brooks and Doxey, with a five-inch lift driven by a B.T.-H. three-phase constant speed squirrel-cage induction motor of 7½ b.h.p. through a Whittaker Hall friction clutch. The motor runs at 960 r.p.m., which corresponds to a spindle speed of about 9,500 to 10,000 r.p.m.

Motor Controllers, Heating Apparatus, and other Exhibits.—It is unnecessary to particularise the representative collection of the standard motor starters, controllers, &c., shown. Among them should be mentioned, however, a compact form of compensator starter for squirrel-cage motors, fully enclosed and combined with main oil switch. In this apparatus separate fuses of different capacities are provided in the starting and running circuits, so that a considerable starting current is permitted without sacrificing close protection when run up to speed. A new upright form of tramcar resistance is shown, which will sometimes be more convenient than mounting resistances under the car frame, and examples are shown of the very complete line of automatic circuit breakers with auxiliary carbon break recently brought out by the firm. It may be mentioned that all the coils of this class of apparatus, and indeed practically all arc-lamp coils and a large proportion of motor field coils, are now wound with enamel-covered wire. It is interesting to note that the first purpose to which the company applied these kinds of wire was for the solenoids of the original electrically operated Curtis turbine governing gear, and its success under these extreme conditions of heat and damp led to its more extensive adoption. The heating and cooking appliances of the British Thomson-Houston Co. have often been described in our columns, and are widely known and appreciated. The representative collection exhibited comprises ovens, percolators, kettles, water-heaters, hot-plates, hot-water cans, flat-irons, and other articles for domestic use. Some of the later patterns are fitted with more complete switching arrangements for varying the degree of heat than formerly. Other exhibits shown include small transformers for metal-filament lamps, measuring instruments, and several patterns of flame and other arc lamps.

Siemens Bros. Dynamo Works Co., Ltd.,

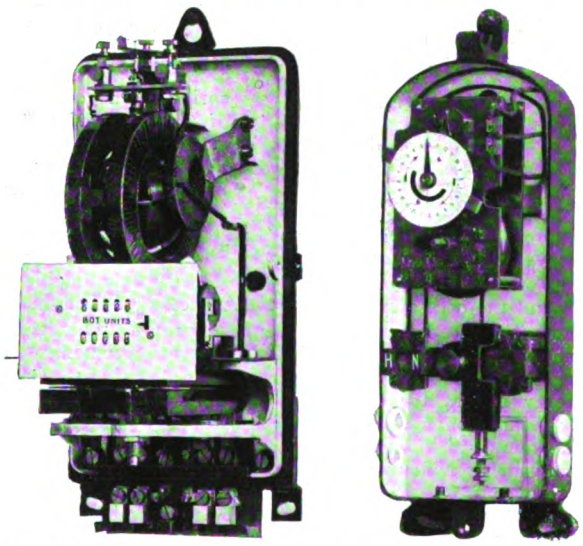
YORK MANSIONS, LONDON, S.W.; 196 DEANSGATE, MANCHESTER; AND STAFFORD. (STAND NOS. 86 & 94.)

Cotton Singeing Machine.—This interesting machine, which is shown in operation, is a development of the so-called gassing frame, in which the cotton thread is passed at a high speed through a gas flame in order to singe off the superfluous fluff.



Bearing Vibrator for Alternating-Current Energy Meter.

In the present machine the cotton is passed at a speed of over 20 ft. per second through narrow split platinum tubes, which are raised to a white heat by the electric current. Each tube



Double Tariff Meter and Clock Switch for changing over the Counting Mechanism.

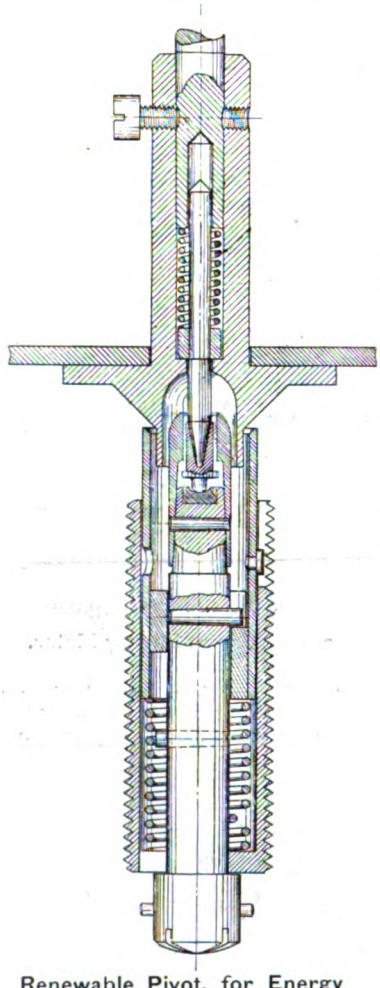
carries a maximum current of 35 amperes at a pressure of from 3 to 5 volts. Owing to the high speed with which the cotton passes through the tube, it does not burn, although it may touch the sides of the tube. The fumes produced are drawn away from the tube by means of a current of air. A small centrifugal fan is provided for this purpose.

Digitized by Google

Electrically-driven Loom.—This is one of Messrs. R. Hall & Co.'s looms, driven by a Siemens three-phase motor rated at ½ b.h.p. and running at 1,000 revs. per min. The motor is fitted with a spring belt-tightening arrangement, and an interesting point in connection with this machine is that it can be brought up to full speed in about one second.

Motors.—A large selection of both direct- and alternating-current motors are exhibited. A 1½-h.p. series motor, which is shown with a 12½-in. fan, has a range of speed from 500 to 1,300 revs. per min. The controller is of the drum type, and the speed regulation is attained by altering the grouping of the motor field coils. Overload and no-voltage releases, which act independently of one another, are supplied in this controller. A large selection of small shunt motors is also shown. Two 3-phase motors, one with wound rotor and slip rings, and the other with a squirrel-cage rotor, are exhibited. A selection of motor starters includes a capstan switch and an oil-immersed Star delta starter.

Meters.—Meters for use on either alternating-current or direct-current circuits of the pattern used for house services up to 200 amperes and 650 volts are shown. One of the latest improvements in this type of meter is the provision of means whereby the pivot at the lower end of the armature spindle can be quickly renewed. The pivot itself is not part of the armature spindle, but, as can be seen from the accompanying illustration, is separate, and is taken away from the spindle when the jaws containing the sapphire bearing are removed. When the jaws are inserted, the pivot is fixed to the armature spindle merely by friction. An illustration annexed shows the method adopted in the case of tramway meters, to prevent the hammering of the pivot on its bearing when the meter is shaken. This consists in supporting the bearing itself on a spring, and also attaching the pivot to a piston, which enters the hollow armature spindle and is cushioned against another spring. The commutator of this type of meter is also readily removed, and pivot, commutator, and brushes can be renewed in a minute or so.



Renewable Pivot, for Energy Meter, showing Springs to prevent Hammering.

The illustration on page 11 gives views of the interior of a double-tariff meter and the necessary clock switch respectively. The hour for changing the rate is fixed by means of the sliding contacts at the periphery of the clock dial. Only one meter mechanism is required, as the clock switch changes over the counting mechanism.

Energy meters for measuring the input and output respectively of an accumulator battery are made on the same principle as the double-tariff meters; that is, they have a single meter mechanism but a double counting mechanism. In this case the change over from one counting mechanism to the other is performed automatically by the change in the direction of rotation, due to the reversal of current.

Energy meters for integrating accurately the power on unequally loaded polyphase circuits are also shown. Among these are meters for 3-phase 4-wire circuits and 2-phase 4-wire circuits.

In order to ensure that a meter shall start on very small loads, Messrs. Siemens Bros. Dynamo Works Co. have developed a form of automatic bearing vibrator; this is illustrated on page 11. When an alternating current is sent through the coil *U*, the armature *J*, being in an alternating magnetic field, will vibrate. This vibration is communicated to the flat spring *D*, and thence to the jewel bearing and spindle *A*. It will be readily seen that the action is similar to tapping the instrument to get the highest accuracy of the reading. By this means the meter is enabled to start at a very small current, and, the friction being reduced to a minimum, the readings will be extremely accurate on light loads. Special precautions are taken to prevent shunt running. This vibrator should be useful for adaptation to meters used in conjunction with small transformers, as it will ensure that the no-load losses are registered by the meters.

Lamps.—A large number of tantalum lamps are in use all over the Exhibition, and the clusters known as "Holophane Arcs" are very conspicuous both on a few stands and in the dining-room of the Exhibition. A selection of carbon arc lamps, including the small enclosed "Liliput" pattern, are also on view.

The General Electric Co., Ltd.,

71 Queen Victoria Street, E.C. (Stand Nos. 152 & 162.)

The General Electric Co. have a large stand situated in a prominent corner position in one of the main avenues. It is most effectively laid out with exhibits representative of the very large range of electrical plant, machinery, and apparatus manufactured by the company, and tastefully decorated and illuminated with the firm's well-known Osram lamps. The exhibits are too numerous to mention in detail; we will, therefore, not attempt at present to do more than indicate their nature and extent.

Plant and Machinery.—In a prominent position on the stand is a 500 kw. motor generator, which is interesting as being one of three that will be used in the new Osram lamp factory approaching completion at Hammersmith. Alongside this, as a contrast, is shown a small motor-generator charging ignition accumulators in garages. Standard "Witton" motors, both continuous and alternating current, are represented by a selection of about half a dozen sizes, and a special three-phase fully-enclosed gas-tight motor in rectangular case for building into the frame of coal-cutting machines is also shown. This motor has an ingenious arrangement of tubes for increasing the cooling surface. Textile driving is illustrated by a complete Northrop loom in action, driven by a Witton 2 h.p. continuous-current motor with special spring suspension to equalise the tension on the belt. In the centre of this part of the stand is a compact 0·58 kw. generating set, driven by a single-cylinder paraffin engine for country house lighting by 25-volt Osram lamps. Examples of the Fynn single-phase commutator motor are also shown, and the groups of working "Freezor" fans were specially welcome in the temperature of the opening day.

Switchgear and Instruments.—A large quantity of switch apparatus and instruments is shown, among which may be mentioned an interesting exhibit consisting of a new pattern of remote control solenoid operated high-tension oil switch of large size, complete with operating panel with push buttons, instruments, relays, signal lamps, &c. Motor starters and controllers are shown in profusion, including several forms of liquid starter. Among the instruments are examples of Dr. Sumpner's patent wattmeters and phasemeters recently described by him before the Institution of Electrical Engineers, in both the switchboard and portable forms.

Lighting and Heating.—The company's well-known "Angold" flame and other arc lamps are exemplified, and a new pattern of magazine flame lamp is shown for the first time. Modern high efficiency incandescent lighting is, of course, well represented by a fine display of Osram lamps, those festooned about the stand on the new "Pixielight" strip being particularly effective. The accessories for these lamps include a range of small transformers enabling low voltage lamps of moderate candle-power to be used on the ordinary alternating supply voltages. Mention should also be made of the "Striplite" system of showcase lighting by tubular lamps in reflectors. The heating apparatus shown includes cooking and other domestic appliances and heaters, both of the lamp, and what the company designate as the "elevector" type. A mention of the display of arc lamp flame and other carbons made at the company's carbon works at Witton should not be omitted, as these are the only carbons of British manufacture. The attractive working exhibit of Robertson lamps is on an adjoining stand, but lack of space compels a description of this to be reserved for a future issue.

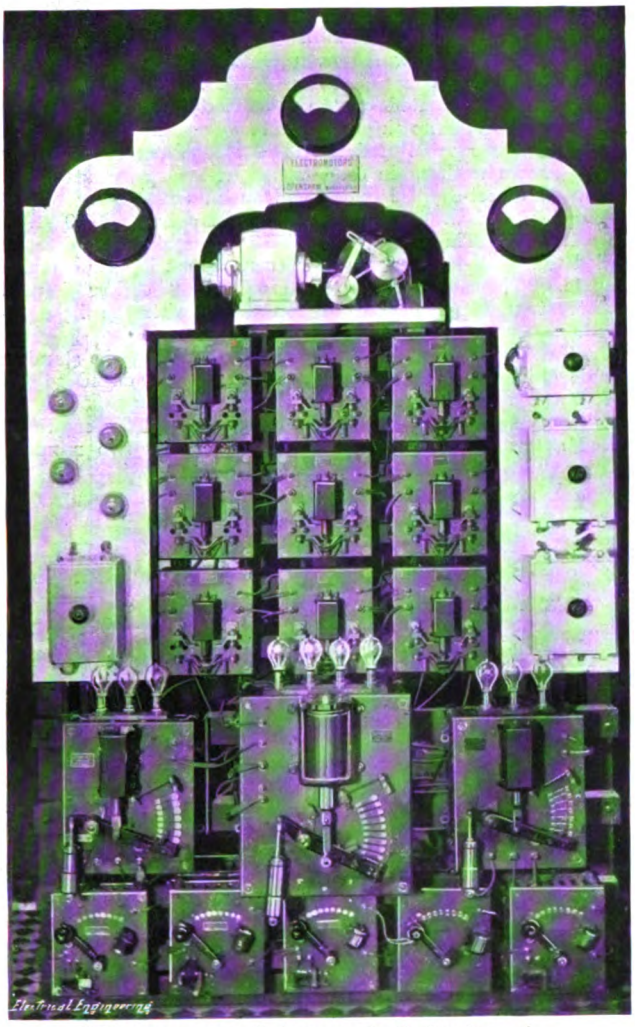
Telephones, Bells, &c.—One side of the main stand is devoted to telephones, and here, in addition to single instruments and apparatus of practically every type, there is a complete private branch exchange board suitable for hotels or large business establishments on the central battery system. Portions of the equipment of the 10,000 line common battery board which is being erected for the Glasgow Post Office Central Exchange are also shown.

Digitized by Google

Electromotors, Ltd.,

Louisa Street, Openshaw, Manchester.
(Stand Nos. 133 and 161.)

A New Exhibition Device.—The stand occupied by Electromotors, Ltd., is an excellent example of the effect that can be

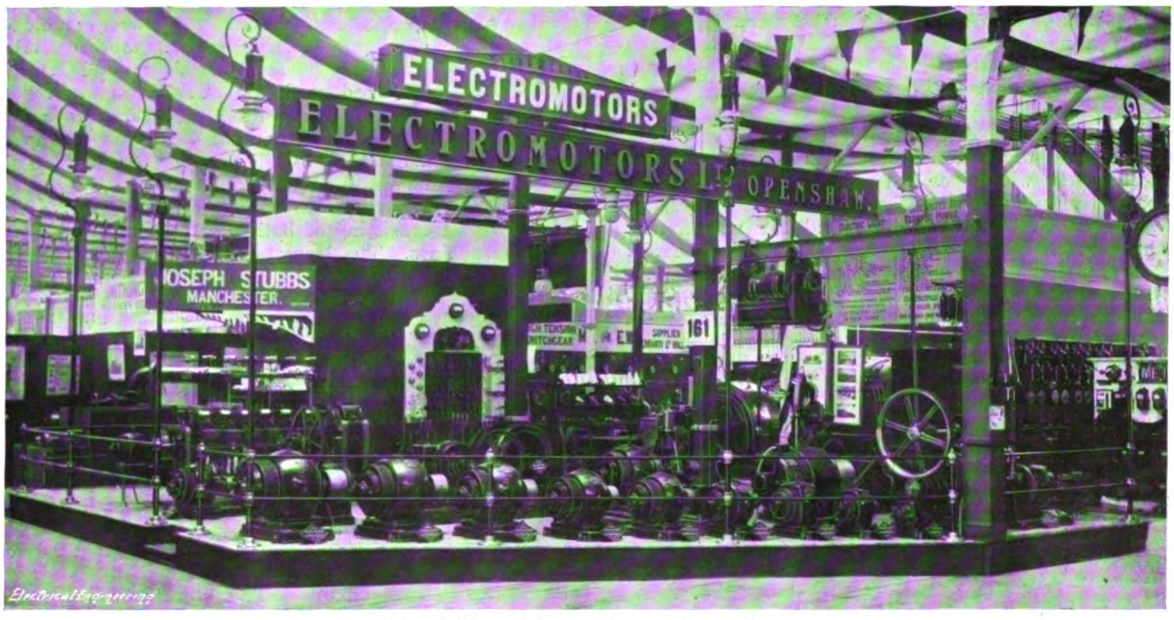


"Electromotors" Automatic Switchboard.

obtained by a skilful arrangement of exhibits. Along the front of the stand, which we illustrate below, twenty motors or motor combinations are placed, and these are connected to an automatic switching arrangement, which puts into operation a different pair of motors every thirty seconds. In front of each of the motors in this row are small illuminated signs, bearing the description of the motor, and the lamp which each contains is connected in parallel with its motor, so that the sign lights up and shows the name in red letters when the motor is running. An illustration of the switchboard is given opposite. At the top of it is seen a small motor with worm gear and a simple ratchet mechanism, which closes the circuit of one of the magnetic switches in the front of the board, switching in a different pair of motors each time, and opening the circuit of the coil holding down the switch of the previous pair. A large "Luxol" sign on the stand, facing each way, bears the name "Electromotors" in large letters, and is a good example of the signs of this class, supplied by Messrs. Krupka & Jacoby. A third useful exhibition device is a small motor driving a set of rotating boards, containing photographs of the firm's shops and manufactures. The drive from the fast-speed horizontal shaft of the motor to the slow-speed vertical spindle of the show frames is a friction drive, and in consequence the frames can be stopped by hand if any visitor desires to examine a particular picture leisurely.

Cotton Machinery.—Messrs. Joseph Stubbs (Mill street Works, Ancoats, Manchester), show two specimens of electrically-driven cotton machinery in connection with Electromotors, Ltd. Both are winding frames. The first is a Foster "camless quick traverse winder," the duty of which is to wind one or more threads from the spools or "cops," which come from the mule, on to larger spools formed on conical paper tubes. These larger spools are employed chiefly in the hosiery and underwear trades. The machine shown has ten cones, which run at a speed of about 1,400 r.p.m., and are driven through spur gearing by a ¾ h.p. motor running at 1,050 r.p.m. It embodies some novel devices from the textile manufacturer's point of view, and runs far more silently than do the majority of such machines. The second is a "quick traverse close winder," for winding one or more threads close together or side by side from the cops or ring bobbins on to parallel "cheeses," which then contain the maximum length of yarn in the minimum bulk. This machine is also comparatively silent, a fact which is a great comfort to the staff of "Electrical Engineering," whose stand is directly facing it.

Motors and Applications.—A complete range of semi-enclosed motors in ten sizes up to 20 h.p., show the firm's standard practice, and an extended range from 20 to 50 h.p. is represented by a 30 h.p. motor on the stand. Among the various motors and applications shown are: A 3 h.p. motor fitted with an enclosed worm reducing-gear with ball thrust bearings and phosphor bronze wheel rim, reducing from 1,100 to 50 r.p.m., the motor and worm gear being mounted together on a substantial bedplate; this combination is suited for the driving of economisers, stokers, organ-blowing, and the driving generally of very slow speed shafting and machinery. A 4½ h.p. lift gear combination, comprising an interpole motor worm reducing-gear, as described above, and an automatic brake, situated between the motor and the worm gear. A 5-cwt. friction hoist, designed to work at 100 ft. per minute, and driven through a combined spur and friction gear by means of a compound wound motor. A main drum haulage set capable of hauling at four miles an hour, direct driven through gearing by a 5 h.p. motor, 850 r.p.m.; this equipment is worked by a reversing drum controller with jaw



General View of "Electromotors" Stand.

Digitized by Google

clutch for disengaging the drum and a powerful foot brake, and is designed for hauling up inclines in which the gradient exceeds 2 ins. to the yard.

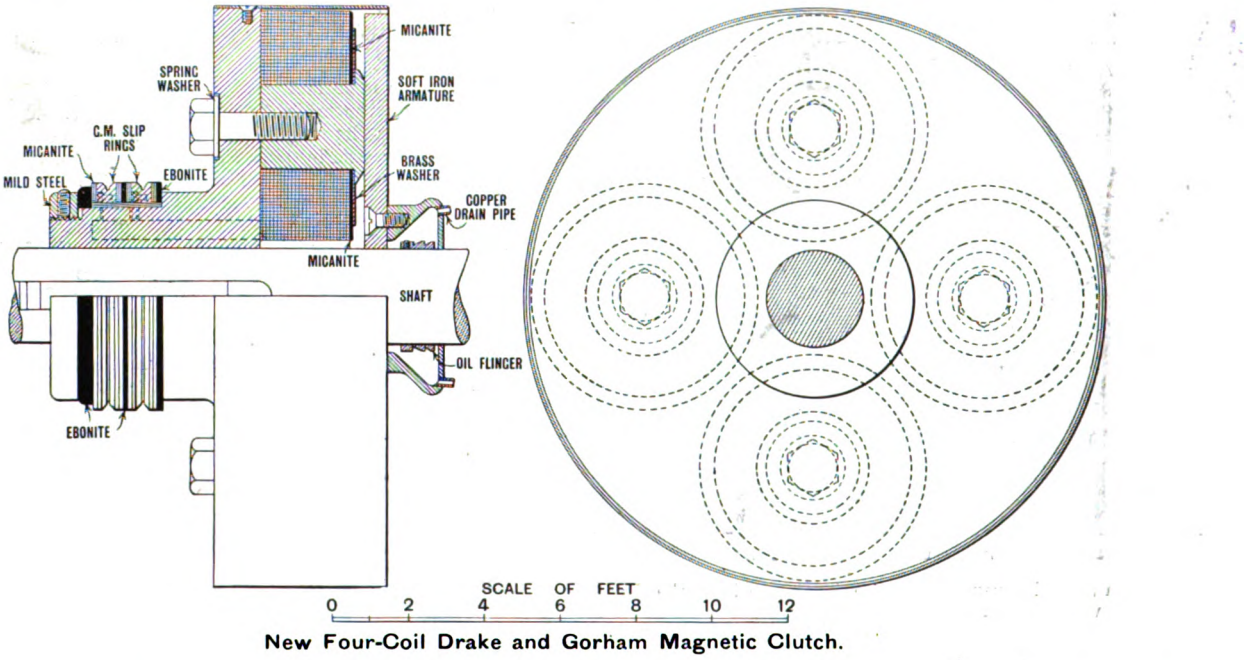
A one-ton electric pulley block of compact design, worked by a self-contained motor, illustrates another of the firm's specialities. These blocks can be supplied of the suspension type with hand-travelling gear or motor travelling gear, for running on the flanges of the single H girder, making an ideal runway for workshops, warehouses, chemical works, and the like.

A petrol dynamo set for private house lighting, by means of a battery and low voltage metal filament lamps, and a 3-kw. steam dynamo, 410 r.p.m., are also exhibited. The latter engine is a 4½-in. by 4-in. open vertical, high-speed, double-acting machine, and is direct-coupled to a compound-wound dynamo on a combination bedplate. These machines are useful for shop lighting, and for small country-house installations.

Messrs. Drake & Gorham, Ltd.,

66 Victoria Street, London, S.W. (Stand Nos. 127 & 164.)

Magnetic Clutches.—An interesting object on Messrs. Drake & Gorham's stand is a new pattern of magnetic clutch which they have recently introduced, and which is illustrated in the accompanying figure. This type is known as the Drake & Gorham No. 1 clutch, and the principal features are the use of four coils, any one of which can be taken out for examination or repair without dismounting the shafting. The effect of residual magnetism, which is troublesome in some forms of clutch, is done away with by the automatic momentary reversal of current. As will be seen, the clutch is very compact. We understand that a number have already been supplied to the Admiralty.



New Four-Coil Drake and Gorham Magnetic Clutch.

Lamps, Switchgear, &c.—A good selection of switchgear, &c., manufactured at the company's own works, is shown. Among these may be mentioned a "fool-proof" battery charge and discharge switch, with two concentric arms interlocked, so that they cannot lie in the wrong position relatively to each other. A 1,000-ampere change-over switch, as supplied through H.M. Office of Works to Buckingham Palace and the new Public Offices, is also shown, and several types of distribution boards.

In front of the stand are two examples of the Jandus regenerative flame arc lamp (described in Electrical Engineering, Vol. III., page 299), and on the stand itself are shown a number of fittings specially made for metal-filament lamps, including examples of effective clusters with holophane glass ware. An interesting exhibit is also the case showing the various stages of manufacture of the tantalum lamp from the wire-drawn "filament" to the complete article. Surface wiring is represented by the two-part grip insulator, and in connection with conduit work a convenient form of earthing clip, fitting any size of tube, is of interest. This was illustrated in Electrical Engineering, Vol. II., page 986. It is impossible to particularise all the useful appliances shown, but attention should be drawn to the excellent display of heating and cooking apparatus. Messrs. Drake and Gorham carried out the wiring and provided the generating plant for the "Model Home" adjoining their stand, which is described elsewhere, and supplied the greater part of the fittings therein.

Union Electric Co., Ltd.,

Park Street, Southwark, London, S.E.

Motor-driven Pumps.—A very striking and representative exhibit has been arranged by this well-known firm. The first item to attract the attention of the passer-by is a complete pumping outfit for a works or private house. This consists of a three-cylinder pressure pump with 3 in. diameter and 6 in. stroke cylinders mounted on the same bedplate with a motor which drives the pump through double reduction gearing. The pump, which is capable of delivering 1,375 gallons of water per hour, is shown working in combination with an automatic float switch. A direct-coupled centrifugal pump, suitable for throwing 80 gallons of water per minute against a head of 80 ft. is also exhibited. The pump, which is shown working, is directly coupled to a Union motor; and the complete set is on a common bedplate. The motor is provided with a "Fortiter" speed regulator to vary the speed in accordance with the head required.

Paraffin Generating Set.—An interesting item on the stand is a single 4 in. by 4 in. cylinder paraffin engine designed to run at 900 r.p.m., and directly coupled to a dynamo. This set forms a safe unit for private house lighting. This engine is started as a petrol motor and runs so for about five minutes, after which the paraffin is turned on. Since the introduction of low-voltage metal filament lamps, enabling the necessary number of storage cells to be reduced, a considerable demand has sprung up for small electric plant, suitable for use in the smaller sizes of country houses. In many cases small petrol motors have been used, with the disadvantage of considerable fire risks. The paraffin motor diminishes this risk, and besides reducing very considerably the cost of working, simplifies the attendance. This little set will supply current for 60 16-c.p. metal filament lamps.

Motors.—A representative exhibit of motors is to be found on the stand, consisting of both direct-current and alternating-current machines. The largest of these is a 440-volt, 110 h.p. motor, running at about 150 r.p.m.; this machine is of the very latest type with end shields, and is fitted with reversing poles. The pole pieces are of laminated iron, securely bolted to the turned cast-steel magnet ring. A large number of small machines, suitable for automatic signs, winding apparatus, hand driving, &c., are shown; these are of the totally enclosed type, and are constructed to run for long periods without any attention whatsoever. Among the three-phase machines are the following:— an 11 h.p. motor with slip-rings, brush raising gear, and short-circuiting device; an 8½ h.p. motor with wound rotor and slip-rings; and machines of 8½ h.p., 6 h.p., 3½ h.p., and 2½ h.p., with squirrel cage rotors.

Arc Lamps.—In the roof of the stand are fitted 8 Excello arc lamps, 4 being on the direct-current circuit, and 4 on the alternating current circuit. The object of this is to show that the alternating-current lamp is just as efficient and satis-

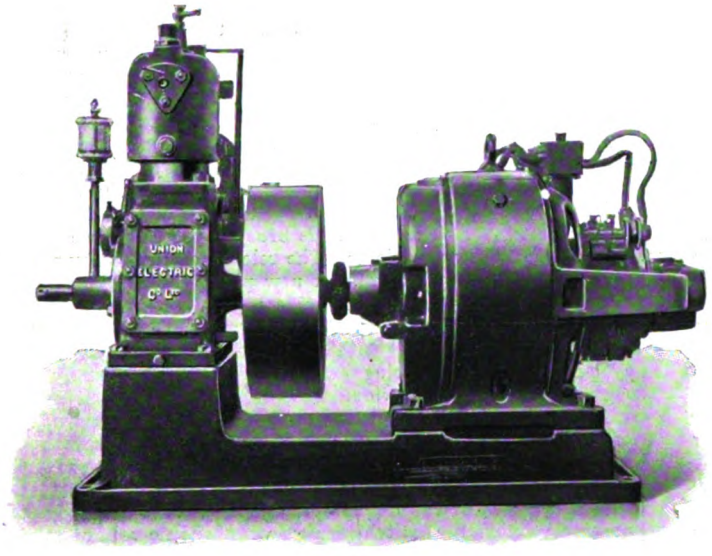
Digitized by Google

factory for lighting purposes as the direct-current lamp; in fact, the Union Co. claim that the operation of the alternating-current Excello arc lamp is even superior. The Excello arc lamp is shown burning yellow flame carbons, and also white flame carbons. Hanging from the roof of the stand are also to be seen two "Coltru" arc lamps for colour true illumination, such as is required in many factories, and in practically all large shops and warehouses. One of these with downward illumination is shown in the accompanying figure. The vital element of the "Coltru" daylight lamp is the light filter. This is a special type of glass arranged to diffuse the light, and spectroscopically selected to absorb those light rays which cause difference in colour values. The Union Co.'s standard pattern of inverted arc lamp is exhibited, and some lamps, with the carbons in the normal position, but with an open bowl of translucent glass below the arc are shown. This is what is known as the indirect lighting system, in which means part of the light passes upwards, and part through the reflecting bowl. This lamp has the advantage of casting no shadow either up or down, and although not quite so efficient as the truly inverted lamp, it has certain artistic advantages. The accompanying illustration shows a view of one of these lamps. At each apex of each of the eight arches at the entrances to the stand are Kohinoor enclosed arc lamps of the new type produced by the company, which are said to have all the advantages of colour truth appertaining to open type pure carbon arc lamps, with, at the same time, long burning hours. In the centre of the stand is seen a photographic arc, of the kind used for printing process work and photographic work. Various types of projectors suitable for theatrical or marine work are shown.

Switchboard and Portable Instruments.—Among the electrical instruments, of which there is a large selection, are several examples of the firm's new type of sector flange instrument, which, although it has a wide sector-shaped front and scale, has a circular body. This considerably simplifies the mounting, as it is only necessary to cut a circular hole in the panel of the board. Several of these and other instruments, and a selection of frequency meters, with single and double ranges, are shown, fitted with illuminated dials on a large board. Among the special instruments is a 15 amp. time-meter, for use where current is charged by the time of consumption instead of by Board of Trade units. There are also a couple of time-meters for tramways, to show the period of time that the current has been on the car.

Switchgear.—A comprehensive exhibit of switchgear includes an enclosed three-pole oil break switch with overload and no voltage release, interlocked with a rotor starter of the oil-bath pattern for a 25 h.p. 3,000-volt motor. One of the most interesting of the switch-gear exhibits, which is also illustrated, is a self-contained high-tension switch-pillar. There is a substantial and well-designed oil-break switch, in which both the overload release and the time-limit control are adjustable from outside the case. One of the most striking low-tension exhibits is that of the marine pattern water-tight switches, tested under air pressure, and ranging up to as large a capacity as 400 amps.

Speed Indicating and Recording Apparatus.—A particularly interesting exhibit is that of a number of speed indicating and recording devices. Some of these are on the voltmeter principle, really indicating or recording the pressure generated by a constant field magneto-generator, driven from the axle of the vehicle or machine, the speed of which it is required to record. The scales are divided off into revs. per min., or miles per hour, as desired. Others work on the principle of the vibrating tongue frequency meters, and the speed is indicated by the vibration of the tongues. These are supplied with current from small alternating-current generators driven from the axle. They may have rotating field or rotating armature. As permanent magnets are used, no slip-rings of any kind are required in the former case.



Small Paraffin Generating Set.

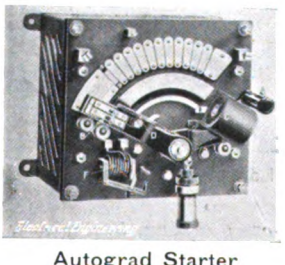
"Coltin" Lamp for downward Illumination.

Enclosed Switch Pillar.

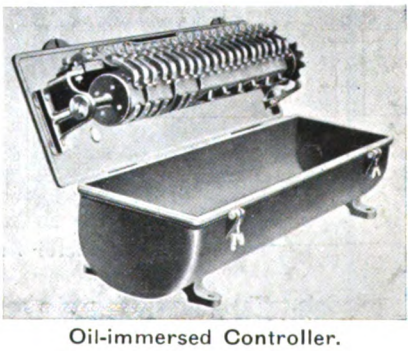
The Electric & Ordinance Accessories Co., Ltd.,

Stellite Works, Cheston Road, Aston, Birmingham.
(Stand No. 1.)

Motor Starters, Controllers, &c.—The exhibits on this stand are representative of a very considerable range of manufactures. A few motors are shown out of the large number of standard patterns made for various branches of industrial work. These are accompanied by a collection of starting and controlling appliances, in which are some interesting patterns. Amongst these is the "Autograd" starter, shown in one of the accompanying figures, in which the handle pulls over the contact arm against a spring by means of an electromagnet. If it is pulled over too quickly the release gear causes the magnet to lose its current, and the contact arm drops back to the off position. Failure of voltage has the same effect. Other controllers include the oil-immersed, three-phase controller, shown in another illustration, and a special controller of the tramway



Autograd Starter (Booker's Patent).



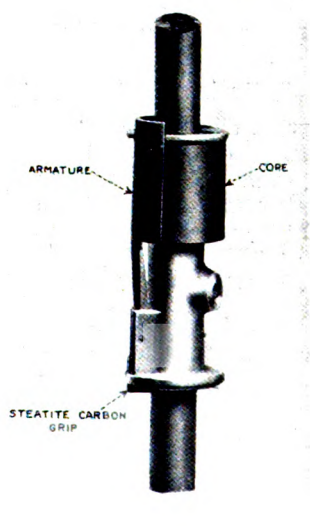
Oil-immersed Controller.

Digitized by Google

type, combined with an interlocked main switch, with automatic release, and a speed-controlling shunt rheostat, which comes into action when the motion of the handle is continued beyond the last series resistance step. The controller is so designed that in the event of either of the releases acting, the circuit can only be closed again by bringing the handle back to the off position. Other special types of controller include the lift controller, illustrated, and examples of a long series of standard starters and controllers are shown. These are built to give good results even when used in damp places; the arc shields and spark guards are of non-hydroscopic material, and no wood or fibre is used in their construction. Samples of an improved type of grid resistance, built up entirely of standard interchangeable parts, and insulated only with mica, are shown, and there is a good display of porcelain bobbins for resistances, and other parts for miscellaneous electrical purposes, made in the company's own factories at Hanley. Other exhibits on the stand include radiators, both of the lamp and convector type, the latter being constructed with a special resistance in the form of a net. In addition to the ordinary types of heater for use in private houses, offices, &c., the firm manufacture special heaters for factories and for trains and tramcars.

Another interesting exhibit on the stand is the Warner Autometer, which is a speed indicator combined with a distance recorder for use on motor cars, but equally applicable to trains and tramcars. The construction of this is very simple. A circular permanent magnet within the instrument is driven by the usual flexible shaft, and above this there is a copper disc held back by a spiral spring, which is deflected through an angle proportional to the speed, by the torque due to the eddy currents produced by the rotating magnets. The scale is marked on the rim of the disc itself in particularly plain figures, which are visible through an opening in the case. The rotating part is mounted in ball bearings, and jewelled centres are used for the swinging disc. It is claimed that a high degree of accuracy is obtainable at low as well as at high speeds.

The company also show a number of their well-known ventilating fans, both of the centrifugal type, for blast furnaces and other work of a similar nature, where large volumes of air are required under pressure, and the propeller type for moving large volumes of air against free intake and outlet. Several examples of the Victor standard miniature enclosed arc lamps and flame arc lamps are shown. All these lamps are fitted with a special form of clutch, which works on an extremely simple



Clutch of Victor Arc Lamp.

principle. The body consists of a solid brass casting, having a cylindrical hole bored through it, to take the positive carbon, but slotted on the lower end to allow of a soft iron armature with a steatite grip to be pivotted therein. This armature envelops the top half of the clutch body; at the top end there is a soft iron core enveloping the body half-way round. This clutch is supported in the air gap formed between the end of the magnet core and the magnet frame. When the current is switched on, a magnetic pull is exercised on the clutch armature, causing the grip firmly to hold the carbon, and at the same time the whole clutch is drawn up, thus striking the arc. A view of one of these lamps is shown in the accompanying figure, together with details of the clutch action.

A. Reyrolle & Co., Ltd.,

Hebburn-on-Tyne. (Stand No. 95.)

Voltage Detector.—A new and very ingenious device for indicating whether high-pressure mains or terminals are live has been brought out by Messrs. Reyrolle & Co. It is the joint invention of Dr. W. M. Thornton, of the Armstrong College, Newcastle, and Mr. H. W. Clothier, of Messrs. Reyrolle & Co. A long fuse wire is enclosed in a fibre tube and connected at one end to a metal tip, and at the other end to a cylindrical layer of foil, which extends within an inch or two of the tip. This is insulated with "Empire" tape, upon which is another cylindrical layer of foil, and this second layer is again heavily insulated with "Empire" tape. The two layers of foil thus form a condenser, and the outer layer is connected to one point of a spark gap about $\frac{1}{32}$ of an inch long, the other end of which is earthed. The whole apparatus is completed by an insulated handle, and measures 2 ft. 6 in. long and 2 in. diameter. When the live terminal is touched with the metal tip, the condenser is charged and a spark is seen in the spark gap. It is thus possible to ascertain with absolute safety whether the main is charged. Such an apparatus has obvious application in the mains department of every high-tension system. The specimen exhibited will stand a pressure of 20,000 volts with safety.

Switchgear, &c.—The firm have brought out a 3-phase motor-starter with no-voltage release. The release is actuated by a light plunger with gravity control. A new plug for heavy current is also shown, similar in general design to that recently illustrated in our columns (Electrical Engineering, vol. ii., page 1029) which is also on view, but with the addition of a catch to prevent any possibility of the plug being pulled out accidentally; the socket of the plug is provided with a flap, which comes up and covers up the socket immediately the plug is withdrawn. On another panel are shown four motor starters, any of which can be switched on to a motor on the stand in order to show the different action. The first of these is the ordinary single-lever type, the second of the double-lever pattern, that is to say, the pattern in which the switch flies off when the no-voltage release acts, even if the operator's hand is still on the handle. The third is the ordinary drum-type controller, and the fourth a new type of double revolution drum controller. In the latter the first revolution switches on the main switch and takes out the series resistance, and the second revolution cuts in the shunt resistance to speed up the motor further. The mechanism of this is cleverly arranged, and the controller thus combines in a compact form in an iron case, a starting switch, and a regulating switch. The motor used for these demonstrations is fitted with a brake pulley, so that a load may be placed upon it, and an ammeter is provided to show the current taken at the various steps of the several controllers. On another panel one of Messrs. Reyrolle's "wait on the first stop" controller is shown in series with an ammeter. The controller is locked on the first stop, and the attendant switches it straight across the mains, and one can observe in the ammeter the current gradually rising.

The Merz-Price System of Main Protection.—The principle of this system of mains protection was described in our issue of May 21st last, but, as now actually manufactured by Messrs. Reyrolle, there are some slight modifications in it. We may mention that Messrs. Reyrolle manufacture it for the British Insulated & Helsby Cables Co., who are the licensees, and Messrs. Reyrolle also have sub-licences, so that they may provide it in connection with switchgear. The chief difference in the system from that which was described on the date above-mentioned is that, instead of using a shunted transformer, an air-gap transformer is employed; three separate relays, one on each phase, replaces the three-pole relays shown in our former diagram. We understand that at present there are in the north of England approximately 200 miles of high-tension network protected on the Merz-Price system, and we are informed that it has acted instantaneously and efficiently in the case of very severe faults on mains. A board is shown on Messrs. Reyrolle's stand to demonstrate the action of the various devices. Relays for cutting out the mains are screwed on to the board, upon which lines have been painted to represent two sub-stations being supplied from the power station on the ring-main principle. An artificial fault is made by connecting an earthed cable to a stud on one of these mains, and it is seen that only the cable on the one side is switched out, the other relays remaining unaffected. The relays are connected to Messrs. Reyrolle's new ironclad high-tension switchgear, which is, of course, placed well to the front of their stand, as it is one of the firm's latest developments. This switchgear, which is also exhibited at the Franco-British Exhibition, is described in detail in Electrical Engineering for July 2nd, 1908.

At **STAND No. 191** The Manchester Electrical Exhibition.

The International Electric Co., 55, Redcross Street, Barbican, LONDON, E.C.

Adnil Building, Artillery Lane, London, E.C.
October 8th, 1908.

TO THE ELECTRICAL TRADE.

MESSRS. MARPLES, LEACH & CO., Ltd., beg to inform buyers in the Electrical trade that they have decided to supply any of their standard stock motors and dynamos at a special discount of 10 per cent. from their ordinary trade prices, as given in their priced stock list issued on the 1st inst., on the understanding that the order be placed during the next four weeks, that is to say, on or before November 7th.

It is the feature of Messrs. Marples, Leach & Co., Ltd.'s business that a customer once secured is loath to place orders elsewhere for a similar class of machinery; and they are prepared to supply a certain number of machines at cost price in order to open new accounts, which, as experience in the past has shown, are bound to increase in the amount of turnover from year to year.

Buyers are invited to examine the sample machines which are shown at Stands Nos. 104 and 105 Manchester Electrical Exhibition. Should they not have received one of our priced stock lists, they can obtain one on application at these stands, or by sending a postcard to the above address.

Messrs. Mountain & Gibson, Ltd.,

Elton Fold Works, Bury. (Stand Nos. 56, 57 & 58.)

Tramcar Trucks and Appliances.—The most prominent feature of this stand is a complete maximum traction tramcar truck of the standard type, of which about 1,350 have been supplied for the London County Council tramways. The main features of the construction of these trucks, which are of the centre-bearing swing bolster pattern, are the care with which all joints are machine-fitted and thoroughly interchangeable. The design is such that there is no strain taken by the bolts at any part, so that in the event of looseness of bolts, no deformation can take place. All bolts are accurately turned and fitted, and all parts liable to wear, such as in the brake gear, are fitted with renewable wearing surfaces, bushes, &c. All looseness and rattling can thus be prevented, and the life of the truck indefinitely prolonged. Another pattern of truck shown complete except for motors is an equal wheeled centre-bearing swing bolster truck for cars of the "interurban" type for Montreal, with built-up side frames. A working model of a radial truck is also to be added.

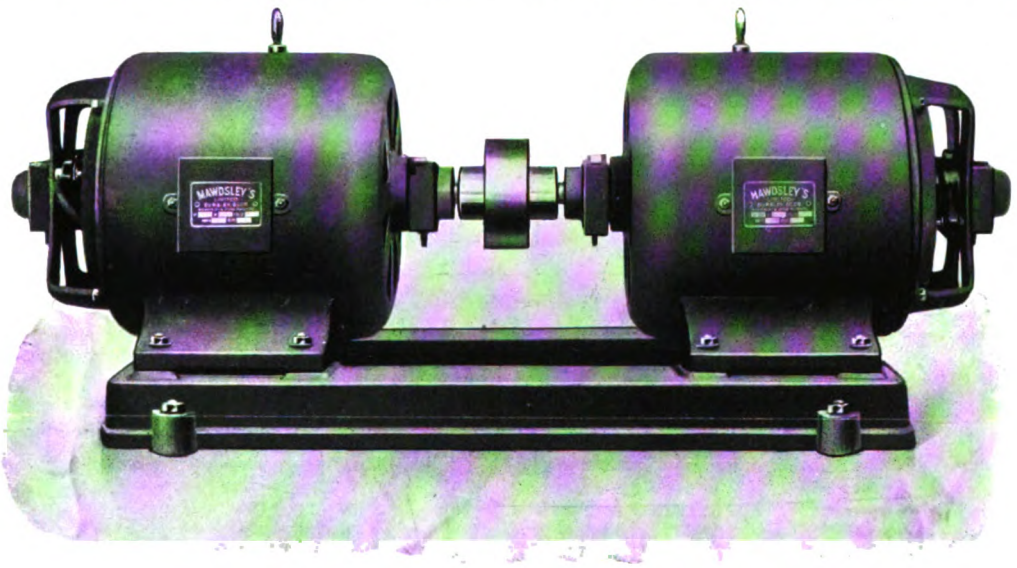
Messrs. Mountain & Gibson also show an example of the Wilson iron roller shutter for car houses, &c., for which they now hold the sole agency for Great Britain, Europe, and the Colonies. Owing to the form of the joints, which are continuous curves entirely without sharp corners, these shutters are particularly easy running. Other tramway appliances shown are the "E. P. D." trolley earthing device and indicator, and the Whittaker sanding device, which is fitted with a special valve arranged to give an instantaneous free passage to the sand and prevent clogging even when the sand is wet.

Mawdsley's, Ltd.,

"Zone" Works, Dursley, Gloucester. (Stand No. 284*a*.)

Dynamos and Motors.—This firm is exhibiting a selection from a line of "Mawdsley's Zone" patent improved motors and dynamos, ranging from ¼ to 12 b.h.p. and from 0·1 to 8 kw., out of a complete range up to 250 b.h.p. and 150 kw. We propose to publish a detailed technical description of these machines, with explanatory diagrams, in an early issue. A 6-h.p. lift motor under a brake load is shown. This motor is controlled by a complete automatic push-button lift-control system. Another 6-h.p. motor, also under brake load, is shown with a controller for crane and hoist work. A 3-h.p. back-geared motor, with a speed reduction of 6 to 1, is working on the stand adjacent, driving a cuff-and-collar ironing machine. One of the most interesting exhibits on the stand is a Mawdsley's patent "Zone" machine taken to pieces to show its construction, and the patented "Zone" winding, whereby the necessity of interpoles is done away with, thus simplifying the design and cheapening the cost of production. All the above machines are shown on the stand of Mr. D. C. Bates, who is the Manchester agent of Messrs. Mawdsley's, Ltd.

A Baby Motor-generator.—The firm is also exhibiting a small motor-generator, which is intended for use on a 200-volt direct-current supply to supply about 30 amperes at 25 volts for running metal filament lamps of low candle-power. An illustration of this set, one-eighth scale, is given below. It runs at 1,500 r.p.m.



Mawdesley 200v./25v. D.C. Motor Generator.

International Electric Co.,

55 Red Cross Street, London, E.C. (Stand No. 183.)

Orieco Metal Filament Lamps, Telephones, &c.—At the International Electric Co.'s stand there is a very effective advertising device. Thirty-two "Orieco" 25-volt metal filament lamps are placed round a frame, in the centre of which is a glass sign. A small motor drives the contact breaker, which lights up the lamps on the frame and the lamps behind the glass sign alternately. The motor is a very small one, and is run through a lamp directly off the lighting circuits. Among the telephones exhibited are some fine loud-speaking telephones for ships' use. Another application of electricity on ship-board is a lamp-signalling system, to replace the bell system on passenger steamers. A passenger presses a button in his cabin, a lamp lights in the steward's pantry, and two other lamps light, one at the end of the passage where the cabin is situated, and the second over the cabin door. This is done by means of relays, and the lamps remain alight until the steward has pressed a button at the cabin lamp. An electrically-worked watchman's tell-tale, which is a new piece of apparatus the company is introducing, is so arranged that the watchman pushes in a button at each station, and a type wheel in connection with a clock is actuated so that the number of the station and the actual time is printed on a strip. The wiring for this need only be a single or double wire, as the type wheel with the number of the station is worked by a step-by-step mechanism. Some large single-stroke bells are arranged for connection to 100- and 200-volt mains, and there is a good show of meters, including a two-rate meter.

E. Green & Son, Ltd.,

2 Exchange Street, Manchester. (Stand No. 111.)

Economisers.—The exhibit of this well-known firm consists of a model of a Green's economiser, containing 72 heating tubes, fitted to a model of a water-tube boiler complete with all feed piping, pumps, valves, and dampers. Another model of an economiser with 96 heating tubes is shown; this is fitted to a model of a Lancashire boiler. The economiser is arranged in two groups of 48 tubes each, and is fitted with all the latest improvements and facilities for easy access to any part of the apparatus. The scraper gearing of both models is actuated by small ¼ h.p. motors, and shows very completely how the heating surface of the economiser is kept free from soot and the full advantage of the heated boiler gases gained. A case of sample tubes, specimen castings, and some tubes which have been burst under a pressure of about 3,000 lbs. per square inch, is also shown.

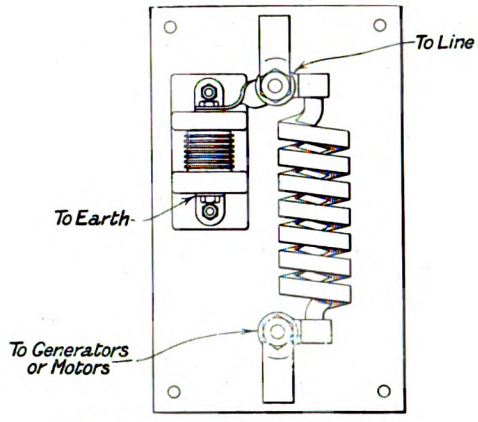
Robert W. Blackwell & Co., Ltd.,

Parliament Chambers, 14 Great Smith Street, Westminster, S.W. (Stand No. 60.)

Transmission Line and Overhead Traction Material, &c.—The exhibits on this stand cover a considerable range of overhead

Digitized by Google

material for traction and transmission. Among these are examples of the actual insulators to be employed on the 65,000-volt transmission lines for the London, Brighton, & South Coast Railway, as shown in the accompanying figure. These are of white porcelain about 11½ ins. high overall, and 7½ ins. and 4¼ ins. minimum and maximum diameter. There is also on view a large selection of the well-known Lima porcelain insulators of the pin and shackle types for voltages up to 100,000 volts. An interesting object in the front of the stand is a complete

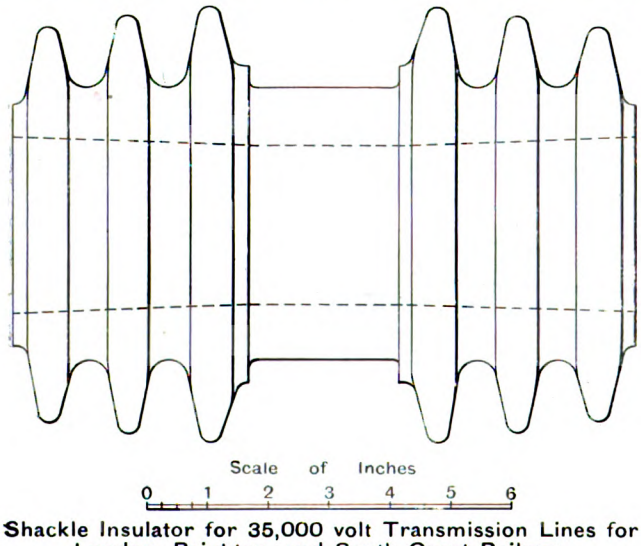


Non-Arcing Lightning Arrester.

A pole as used on the 6,000-volt transmission lines of the Newcastle-upon-Tyne Electric Supply Co., complete with insulators, guard wires, &c.

Several forms of lightning arresters are shown, including the ordinary horn variety, combined with choking coil for use in the open air, and the non-arcing switchboard type shown in the accompanying illustration, in which a pile of discs of a special carbon preparation, separated by mica plates, are used. Some of these are shown enclosed in watertight cast-iron cases. There are also exhibited various patterns of joint boxes, cable "pot-heads," &c.

A number of samples are shown of bitumenised fibre conduit, which has advantages of being non-hygroscopic and entirely non-corrodible, besides being considerably lighter than iron pipe for transport, and very easily laid and jointed. This fibre conduit is different from other forms on the market, in having a thicker wall than usual and a longer joint. It is built up of alternate layers of fibre and asphalt. Among other specialities



Shackle Insulator for 35,000 volt Transmission Lines for London, Brighton, and South Coast Railway.

represented on the stand to which attention may be drawn are a special insulating paint and the new Genasco asphaltic roofing material, with which the office on the stand is covered.

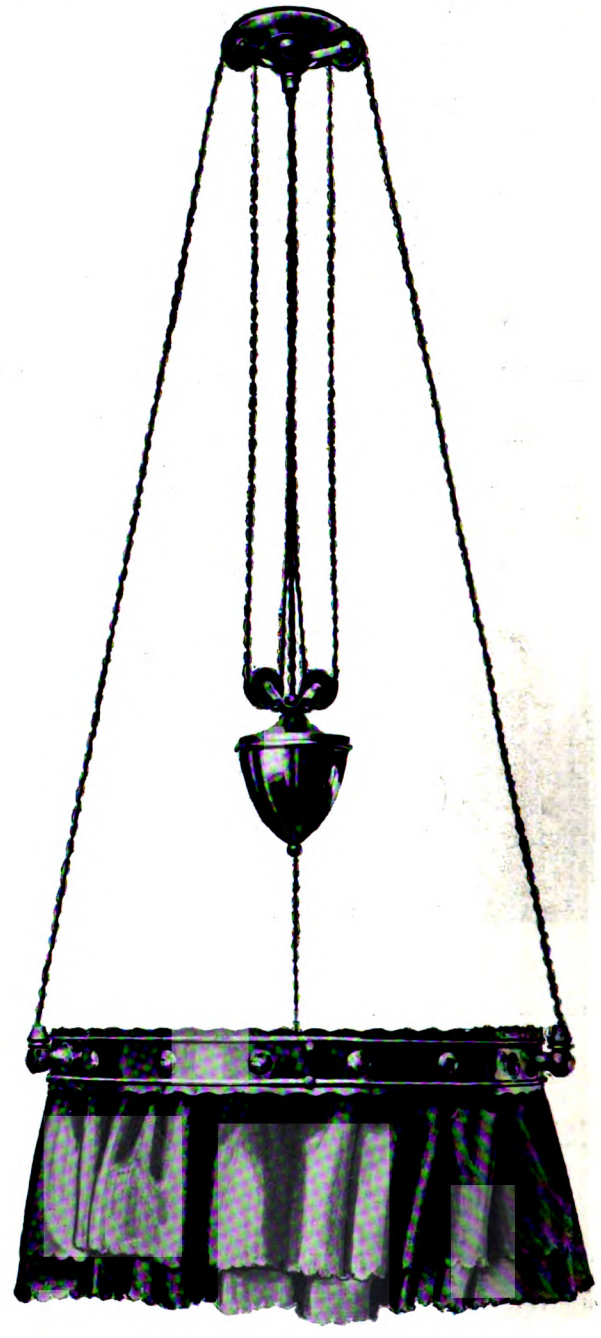
The company have recently introduced a new insulating material known as Litholite, which can either be obtained in sheets, moulded on to metal parts of any kind, or used for such purposes as bobbins for field coils, &c. The material is claimed to be non-hygroscopic, and of much higher insulating quality than fibre. The company now use litholat instead of Aetna material in a number of the standard tramway fittings, such as "Globe" strains, insulated bolts, &c., and in the Fawdry insulator. In these a special coating is electrically deposited on the bolts before the insulating material is moulded on in order to prevent the creeping in of rust.

Some examples are shown of litholite insulation for wireless telegraph aerials, as supplied to the Admiralty. A description of the leading features of the stand would not be complete without a mention of the display of galvanised fittings for pole lines and other overhead work. Messrs. Blackwell are now agents for the "Romapac" system of tramway track, in which the rail is provided with a separate head, which can be removed and replaced by a special machine in place.

The Edison & Swan United Electric Co., Ltd.,

36-37 Queen Street, London, E.C. (Stand Nos. 22 & 46.)

Lamps, Fittings, Instruments, Accessories, &c.—One of the most effective and well-arranged stands in the exhibition is that

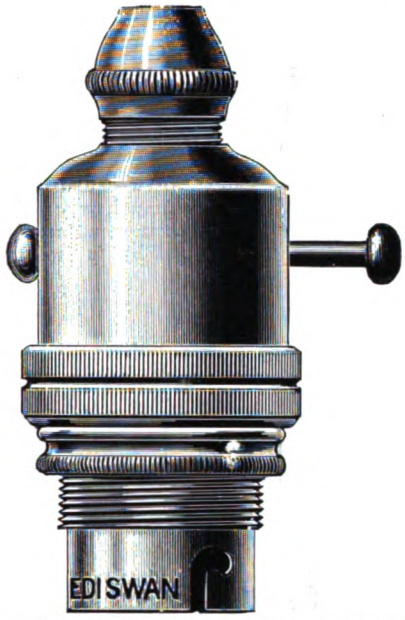


Ediswan Counterweight Fitting.

of the Edison & Swan Company, on which are displayed not only the company's well-known Royal Ediswan carbon lamps, but also examples of the new metal filament lamp made at the Ponders End works, which will soon be on the market in large quantities, and is to be known under the name of the Royal Ediswan Metfil lamp. This is shown in the 100-volt 32 and 25 c.p. sizes, as well as for 50 volts as already exhibited at the

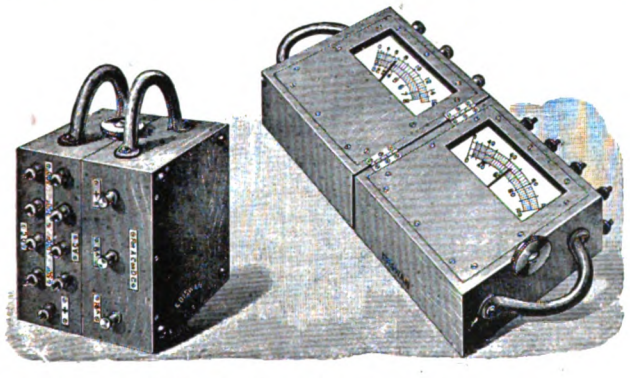
Digitized by Google

Franco-British Exhibition. In connection with these, the company's small transformers for running low voltage metal filament lamps may be mentioned. A very good display of fitting repre-



New Pattern of Ediswan Switch Holder.

sentative of a variety of styles, including Adams, Louis XIV., XV., and XVI., Renaissance, Georgian, and Flemish, is to be seen. A new design of the light counterweight fitting among these is illustrated herewith. In addition to these counterweight fittings some very neat types of spring extension pendants without weights have been introduced. These spring counterweights are applicable to three-light as well as single-light fittings. Attention should also be drawn to a series of very



Ediswan Portable Testing Set.

artistic table lamps and other fittings in Doulton ware, and some handsome bronze figures.

A number of Ediswan instruments are shown, and among these there is a novelty in the shape of the testing set consisting of a portable ammeter and voltmeter for several ranges in wooden cases hinged together, as shown in the accompanying illustration. Among the switchgear and accessories shown may be mentioned a large knife switch type of cut-out in iron cases designed for use as main fuses on house or power circuits, automatic circuit breakers, and an improved pattern of knife switch of great mechanical strength. Specially noticeable is the recently introduced "Phlatta switch," which is shown in an extremely neat-looking rectangular pattern, as well as the round type. This switch is well known as having an extremely small projection from the wall, while containing a well-made movement on the wedge system. Among the many other accessories may be mentioned the new form of switch-holder illustrated, which is of remarkably simple but substantial construction. Several types of distribution board as shown, including a high class form in asbestos-lined iron case. The numerous other exhibits include fans, flame arc lamps of the yellow and pure white types, and in a prominent position on the stand is an example of the effective "Ediswan Luxol" illuminated sign; in these signs, each letter is made of opal glass with a full rounded surface, and bevelled extremities, so that by daylight it reflects the light at every angle. The under-surface is hollow, and the curves are such that at night a single 5 c.p. lamp is sufficient to illuminate thoroughly every portion of a 6 in. letter.

Bray, Markham & Reiss, Ltd.,

Blackhorse Lane, Walthamstow, N.E. (Stand No. 20.)

Motor Starters.—A considerable number of different types of starter are shown, including a new design of automatic starter for use with float switches or other form of distant control. This is marked by a small motor within the case, which actuates a ratchet device by a crank action and pulls over the starter arm one step at a time against a spring. Releases are fitted to cause the arm to disengage and fly back, and at the same time to heat the circuit of the operating motor in whatever position the starter may be in case of overload or failure of voltage. Examples of the latest standard type of B.M.R. starter, with ratchet motion worked by rocking the handle to and fro, are also shown. Another well-thought-out starter is that of the Admiralty type, in which the starter arm is interlocked with a double-pole main switch by an ingenious toggle arrangement. These starters are largely used on board ship for turret control, and are made with mica insulation throughout, as the use of slate and marble is not permitted under these conditions. A different type on a marble base is made for dockyard use. All the starters described above are fitted with renewable carbon breaking contacts on every step, and are so designed that no current passes through the arm. Another well-designed piece of apparatus is a pillar with combined starter and shunt rheostat for speed regulation, interlocked together. In addition to this continuous-current apparatus a very compact form of anti-transformer starter for squirrel-cage induction motors is also exhibited, and examples are shown of the B.M.R. enclosed double-pole switch. The mechanical design of the switch is of the simplest. Two levers are mounted on one pin, a spring tending to keep them normally together. Two links forming a toggle joint are pulled into line by a sleeve mounted on a sliding rod and force the levers apart, thus pressing the insulated spring brush against the contacts. To switch off, the rod is pushed inwards till the links are above the dead point, when a spring brings them rapidly together, the sleeve sliding up the rod, thus renders the quick break, independent of the operator. In the front of the stand is a showcase demonstrating the construction of the special form of enamelled metal tubes used for the resistances in some of these starters. These are coated first with hard enamel, and then with a coating of softer enamel. The resistance wire is next wound on, and a subsequent firing causes it to embed itself into the soft enamel, but not into the lower layer of hard enamel.

National Gas Engine Co., Ltd.,

Ashton-under-Lyne. (Stand No. 271.)

Gas Engines.—On this stand is shown an example of the latest pattern horizontal single cylinder gas engine of the firm's Y. E. type, designed for an output of 100 b.h.p. with suction gas. The engine is shown running, at a speed of 200 r.p.m., from a suction producer plant. It is of a new design, only three of which have been manufactured, the other two being in the Franco-British and Scottish National (Edinburgh) Exhibitions respectively. The engine is entirely throttle governed, and runs remarkably steadily. Low-tension magneto ignition is fitted, and two separate magnetos are provided, one on each side of the cylinder, as this is not only found to give more rapid combustion, but affords greater security in case of weakness of one of the sparks. A special arrangement for lubricating the exhaust valve guides is adopted, and the main and cam-shaft bearings are all ring lubricated. In addition to this engine, a small 9½ b.h.p. single-cylinder horizontal engine is shown, running on town gas, and driving a dynamo by Messrs. J. Hall & Co., giving an output of 29 amperes at 200 volts, and running at 250 r.p.m.

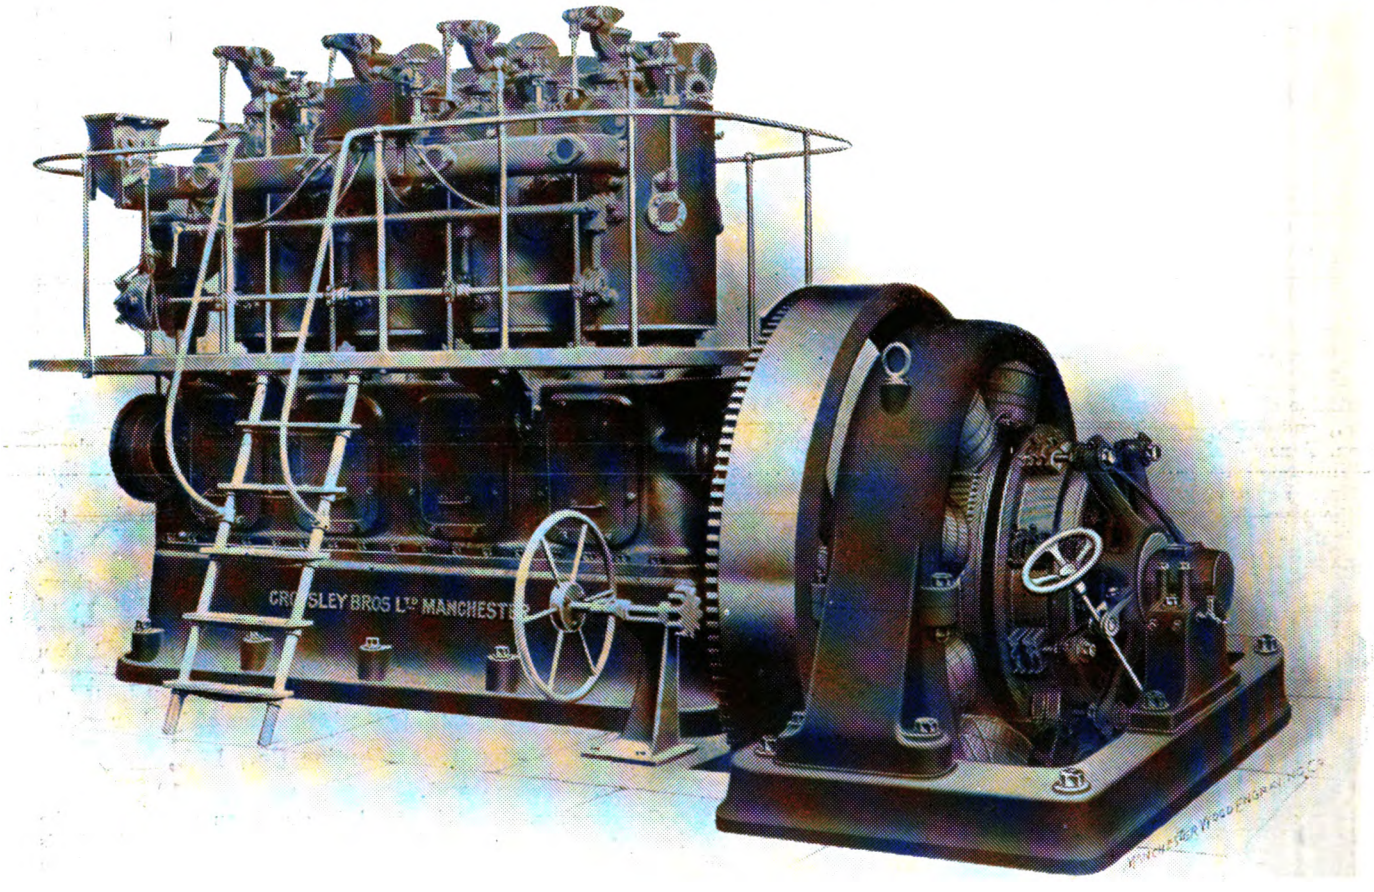
Crossley Brothers, Ltd.,

Openshaw, Manchester. (Stand No. 269.)

Gas Engines.—The chief object of interest on this stand is an example of the new vertical four-cylinder Crossley gas engine, coupled directly to a generator, which is connected up to the exhibition sub-station, so that it can be used for emergency lighting, or to assist in the general supply to the exhibition. The engine is similar to that shown in the accompanying illustration, and is designed for an output of 110 b.h.p. on suction producer gas, or 125 b.h.p. on town gas. It runs at 250 r.p.m., and is direct coupled by a Raffard flexible coupling to a 75-kw. continuous-current generator of the General Electric Co.'s make. Some of the features of the engine lie in the position of the inlet and exhaust valves, both of which are in the cylinder heads, and are operated by overhead rocking levers from a

Digitized by Google

single camshaft. Forced lubrication is used, and the ignition is on the high tension system by battery and coil. In these engines the governing is entirely on the throttle, without any hit and miss arrangement. Their excellent running is largely attributed to the way in which the gas and air are throttled separately, and only mix on entering the cylinder. It should be mentioned that the governing arrangements are so designed that the engine can be changed over from producer gas to town gas, and *vice versa*, without stopping. A similar engine, but of larger size, is running at the Franco-British Exhibition. The set is supplied from one of the firm's No. 6 suction producers on the stand, using anthracite fuel. A smaller engine of 37 b.h.p., of the more familiar horizontal single-cylinder type, with magneto ignition, is also shown running. Compressed air for starting is supplied by a small compressor driven by a single-cylinder petrol engine, which compresses up to 150 lbs. per square inch, but starting can be carried out until the pressure falls to 80 lbs. per square inch. Another set shown is a small two-cylinder vertical engine, running on benzine, coupled to a Mather & Platt 8¼-kw. continuous-current generator, running at 700 r.p.m.



Crossley Four-Cylinder Vertical Gas Engine.

"Electrical Engineering."

203-206 Temple Chambers, London, E.C. (Stand No. 189.)

Electrical Engineering.—This stand is in a very central position in the hall, and the large illuminated sign attracts much attention to it. The sign is 18 ft. long and 6 ft. 6 in. deep, and bears in blue letters on dead white background a facsimile of the title, "Electrical Engineering," on the cover of the paper, with a bold 1d. on either side of it. Forty-eight 25-volt 16 c.p. Osram lamps are arranged in two rows at the top of the sign, and a large reflector casts the light down over it, so that the white surface is very brightly illuminated. A good proportion of the light also falls on the shelves on the front of the stand, upon which copies of Electrical Engineering are displayed. The walls of the stand and two screens provided for the purpose are hung with an interesting collection of pictures cut out from various numbers and framed. In a comfortable office in one corner of the stand the editorial work in connection with the exhibition is conducted, and visitors are always welcome there.

G. M. Boddy & Co., Newington Works, Liverpool. (Stand No. 198.) *Lamps.*—On this stand there has been erected an effective board with various types of lamps upon it, which can be connected up to a wattmeter on to a 200-volt D.C. circuit by means of 12 switches. Thus, for instance, he shows that two Sun tantalum lamps in series take 81 watts, a 200-volt 32-c.p. "Metalik" lamp takes 35 watts, that a 200-volt 100-c.p. "Metalik" lamp takes 98 watts, and a 16-c.p. carbon lamp 66 watts. Another exhibit of which the firm is proud is a 200-volt "Metalik" lamp fixed in a perfectly horizontal position on a bracket, and although it is continuously alight the filament does not sag.

The Bell Rock Belting Co., 24 Gravel Lane, Salford, Manchester. (Stand No. 270.)—This firm show samples of a variety of different kinds of belting of their manufacture, including a special quality of balata belting. This is made entirely from cloth, specially manufactured by the company themselves for the purpose, by which a particularly uniform quality can be obtained. The full amount of stretch of the material is obtained during manufacture, it being kept under tension during the whole process, so that when the belt is taken into use further stretching is impossible. A number of other patterns of belting are shown, including a solid woven cotton belting, and several varieties of leather belting.

J. W. & C. W. Phillips, 23 College Hill, Cannon Street, London, E.C. (Stand No. 3.)—This stand is devoted to examples of the recording instruments of the Bristol Co., for which Messrs. Phillips are agents. The instruments shown comprise recording pressure gauges, voltmeters, and ammeters of a particularly compact form, in which a circular revolving disc carries the card on which the record is made, instead of a continuous strip being used wound on a drum. This has the advantage that the whole record can be seen without removal from the instrument. The instruments are contained in the portion of the case below the dial, so that the pointer is in an almost vertical position.

The exhibits described in these pages represent only a few of those on view at the exhibition, and further articles will appear in following issues of this supplement, which will continue throughout October.

PUBLISHERS' ANNOUNCEMENT

The price of "Electrical Engineering" has been reduced to 1d.

The first number of "Electrical Engineering" was published on January 3rd, 1907, and the paper immediately took the leading position among the electrical newspapers. A thoroughly sound and practical technical paper, written and edited by men with long experience on the practical side of the electrical engineering industry, and illustrated with useful drawings to scale and well-printed photographs, was welcomed, and in spite of the comparatively high price of 6d., which it was necessary to charge for it, the paper scored an immediate success. The proprietors were, however, repeatedly urged to reduce the price in order to bring the paper within the reach of a wider circle of readers, and they decided from October 1st last to place "Electrical Engineering" on sale throughout the United Kingdom at the popular price of 1d. weekly (post free 1½d.). The leading features of the Paper remain unaltered. No change has been made in the Editorial Staff, the same high-class printing and illustrations are maintained, and the proprietors rely absolutely on the enormous increase of circulation which is assured, to recompense them for the sacrifice they are making in decreasing the price.

SUMMARY

Our account of the exhibits at the Manchester Electrical Exhibition is continued in the third of our series of special supplements, which accompanies this issue.

A letter from Mr. G. Wilkinson, Borough Electrical Engineer, Harrogate, raises some important points to central station engineers in connection with the increasing adoption of metal filament lamps. Mr. Oswald B. Davis deals with the prevention of breakdowns similar to that which occurred recently at Lots Road. (Page 538.)

Some illustrations are given showing the nature of the apparatus at the Lot's Road generating station of the Underground Electric Railways, the breakdown of which caused the stoppage of four electric railways. (Page 539.)

The first heavy reversing rolling mill in this country to be electrically driven is one in the works of Messrs. Dorman, Long & Co., at Middlesbrough, which

Digitized by Google

has been equipped by the Electrical Co. The rolls are directly coupled to a 1,200-h.p. continuous-current motor capable of working up to 3,600 h.p., supplied with current through an Ilgner flywheel set driven by a 950 h.p. three-phase motor. (Page 540.)

The machines manufactured by Messrs. Mawdsley's, Ltd., and known as the "Zone" dynamos and motors, have several unusual features in their design. In order to prevent distortion of the main field and the consequent excessive voltage between commutator segments, the main poles are divided into two halves. The field coils are so arranged as to extend over the whole pole pitch; and the influence of the sides of the coils, which lie parallel and close to the sides of the armature coils undergoing commutation, is said to considerably reduce the value of the current in the short-circuited coil, and further to reduce the reactance voltage. The mechanical construction of these machines is also of interest. (Page 541.)

The International Conference upon Electrical Units and Standards, called together by the British Government, commenced its sittings on Monday in London. Mr. Winston Churchill, M.P., welcomed the delegates, who represent thirteen countries, and Lord Rayleigh was elected President of the Conference. A Technical Committee was subsequently appointed to consider in detail draft specifications of the ohm, the ampere, and the volt. A resolution was passed by the Conference adopting the C.G.S. electro-magnetic system as the basis of measurement. In a discussion upon a further resolution that the international ohm shall be defined as the resistance of a specified column of mercury, Dr. Rosa, of the United States, suggested that the length should be specified as one metre. This point was referred to the Technical Committee on Tuesday, when it was negatived. The adoption of the ampere as the second primary unit was decided upon at the meeting of the Conference yesterday. (Page 543.)

An application has been made to the Burnley Corporation by the London Electrobus Company for permission to run a service of omnibuses in those parts of the borough where there is at present no tramway service.—The Cardiff Corporation contemplate seeking Parliamentary powers next session for wiring consumers' premises, hiring out motors, fittings, &c.—The use of trolley omnibuses is under consideration at Liverpool and Falmouth.—The proceedings in connection with the application of the Hove Corporation for a reduction in the charges made by the local electric supply company have been concluded, and a report will be issued by the Board of Trade shortly.—The National Electric Construction Company propose to introduce a Bill next session for the substitution of the overhead system for the surface contact system in Folkestone, Sandgate, and Hythe.—An offer has been made to the Oxford Corporation by the National Electric Construction Company for the installation of the conduit system in the centre of the town and the overhead system in the other parts, in substitution of the surface contact system originally proposed.—Mr. Arthur Wright has been appointed by the West Ham Corporation to advise in relation to the contracts for power which were the subject of comment at the recent Local Government Board inquiry. (Pages 545-547.)

A loan of £23,823 for electrical purposes has been sanctioned to the Coventry Corporation. A Local Government Board enquiry has been held into an application by the Sheffield Corporation for a loan of £11,000 for electrical purposes. The Dublin Corporation have applied for a loan of £4,000. Tramway material is required by the Leeds Corporation. The Walthamstow Council invite tenders for arc lamp carbons. Three double-truck tramcars are required at Southend. A large number of tenders have been accepted for tramway material by the London County Council during the recess. (Pages 548-549.)

The report of the Victoria Falls Power Company from the Incorporation of the Company in 1906 to December 31st, 1907, states that the surplus of revenue over expenditure, namely, £36,685, has been carried forward. The Power Station at Brakpan is completed and the construction of another steam generating station at Simmer Pan is rapidly progressing. (Page 549.)

Among the specifications published by the Patent Office on Thursday last is one by Mr. H. A. Mavor, describing a modification of his system of electric marine propulsion, and another suggesting a method of diminishing the rolling of ships. Messrs. Siemens Brothers Dynamo Works, Ltd., have patents referring to alternator armature winding and high-speed commutator construction respectively; and the British Thomson Co. protect an improvement in automatic motor starters. The satisfactory running in parallel of motors on petrol—electric, and other vehicles is the subject of a specification by Mr. W. H. Stevens. J. S. Pullan patents a compound tramway rail with renewable tread. The Telegraph and Telephone patents include a system of avoiding interference in wireless telegraph of A. M. Young and the Marconi Co., and a telephone relay of R. A. Fessenden. Short abstracts of these are given in our Patent Record. (Page 551.)

The Paper by Mr. C. Koetgen and C. A. Ablett on Rolling Mills, read before the Middlesbrough meeting of the Iron and Steel Institute, contained a quantity of data drawn from actual results with electrically-driven rolling mills, and considered a number of points in connection with the design and operation of electrically-driven rolling mills in the light of this experience. (Page 553.)

Under Electrometallurgy there appear notes on the electrolytic refining of gold, silver, &c., at the San Francisco Mint, and the preparation of steel for permanent magnets. (Page 553.)

The Board of Trade have issued a revised set of regulations under Section 4 of the Electric Lighting Act, 1888. These deal with the erection of overhead wires, where the owners are not subject to the provisions of a licence, provisional order or Special Act of Parliament. They supersede regulations previously in force, and there has been considerable revision. (Page 554.)

Novelties in the shape of a new ironclad switch and a new design of bell push are described on page 556.

The International Conference on Electrical Units and Standards which is now sitting has been convened by the British Government in response to a request made from America. The chief object may be said to be to extricate those countries which have adopted the Clark cell as a standard from the difficulty which has arisen from the discovery that its value is not 1·434 volts, but about 1·433. We are in no such difficulty, for the Board of Trade standard is an electrostatic volt meter calibrated by reference to the ampere and ohm. The eminence of the respective delegates will ensure thoroughness in the consideration of the questions at issue, but opportunities will no doubt be taken, as is usual in such meetings, for a certain amount of axe-grinding and faddism.

The Board of Trade Regulations, which we print in full on another page, do not apply to electricity undertakings working under Provisional Orders or

Digitized by Google

Special Acts, but relate to the smaller number of undertakings, as a rule of comparatively small size, working without Provisional Orders or Special Acts, and therefore exempt from the provisions of the Electric Lighting (Clauses) Act and falling under Section 4 of the Act of 1888. They are in many respects identical with the first part of the 1906 regulations referred to—that is to say, the part which is for the purpose of securing the safety of the public; but the second part, "for ensuring a proper and sufficient supply of electrical energy" and dealing with the obligation to supply current continuously at constant pressure, frequency, &c., is not included, for the so-called "non-statutory" undertakings are not bound by these conditions. The sections of these new regulations to which particular attention may be directed are those relating to earthing and testing, as these represent the requirements of the Board of Trade in all cases, both for statutory and non-statutory undertakings, and are put in a more complete form than in the 1906 code.

THE reason for the adjournment of the debate upon the London Electric Power Bills in the House of Commons on Monday, once more emphasises the difficulties which the electrical engineering industry has to contend with at the hands of the legislature. Politics is again playing the leading part in deciding this question, for the objection of Mr. Lough, the member for West Islington, to the discussion being taken on Monday, the day appointed before the House rose for the recess in August, was suspiciously like the obstruction which was, in reality, the main cause of Mr. Merz's Bill of 1905 failing to become law. So keen is the opposition of the borough councils in London to any definite decision being arrived at, and so great is the pressure which is being brought to bear upon their local members to this end, that it would seem that the latter, in an effort not to irritate their constituents, and at the same time avoid quarrelling with the Government, will elect to adopt what are, in effect, obstructive measures, as the only way out of their difficulty. From the political point of view, the present position is much more complicated that it has been hitherto, for the London County Council are supporting the London and District Electric Power Bill, and the Government has given it a somewhat evasive approval, in face of which the position of the members of Parliament representing those authorities owning electricity works is distinctly an unenviable one. It is the action of these members which the promoters of the Bill have to fear most, in view of the length of time which a Committee must necessarily take to consider the measure and the short autumn session available. The opportunity for preventing Bills being considered upon their merits, which is afforded members, is a serious defect of our Parliamentary system.

THE enormous strides that have been made in the design of motor starters is very evident from even a casual stroll around the Manchester Electrical Exhibition. Before electric driving had assumed the important position it now occupies in engineering works, the man who had to start a motor was more or less of an expert—at any rate, when motor drive was the exception rather than the rule, it was possible to instruct each individual machine hand in his duties. Now, however, the whole conditions are different, and the motor-driven machine tool is the rule rather than the exception. There will, perhaps, be hundreds of motors with their main and starting switches throughout the works, and it is a necessity that the starting and stopping of the motors is a simple matter and leaves no possibility of injuring the motor if done carelessly. The whole design of motor switches has, therefore, undergone a radical change during recent years, and the modern "fool-proof" switch is one of the most perfect products of the electrical manufacturer. It is now made impossible to start the motor too quickly or to hold the starting switch on the starting contacts so as to use it as a regulating switch; in some designs the main switch and fuses are combined so that the case cannot be opened when the switch is on, and so that the main switch is always securely locked in the "off" position when the case is open. Other most ingenious devices have been contrived for special uses, and the whole design of the switches and cases is of a substantial pattern which represents an enormous advance upon the flimsy open types of starter to which one was accustomed in the earlier days of electric driving. The modern motor starter perhaps does as much to recommend electric driving to the average works manager than the most elaborate data with regard to the saving in coal and the speeding up of the machines and consequent increase in the output of the shops. An increased output, decreased coal consumption, and steadier drive would all be neutralised if it involved the frequent repair of motors due to improper starting.

Accident at the County of London Electric Supply Co.'s Station.—On Friday evening a fire broke out at the County of London Electric Supply Co.'s City Road generating station, which caused some damage to the switchboard and a portion of the roof of the power house. It is stated that a workman was slightly burned. The mishap caused a slight interruption to the supply in the district by that station. We have received from the company the following account of the occurrence:—"The operating engineer was in the act of synchronising a 400-kw. motor generator when an arc occurred on the switchboard. Immediately following this a short circuit occurred on the main panel of the 1,500 kw. turbo alternator, resulting in a section of the switchboard being completely burnt out, but the remaining portion of the switchboard was not injured, and we had therefore no difficulty in resuming the supply by at once starting up a reserve turbine set of 2,500 kw."

London Electric Power Bills.—When the second reading of the London Electric Supply Bill and the London (Westminster and Kensington) Electric Supply Bill was called on Monday in the House of Commons, objection was taken, and the consideration of the two Bills has been postponed, it is understood, until Monday next. It will be remembered that when the London and District Electric Power Bill was read a second time in August, the Bill was supported by a large number of Liberal members for the reason that the County Council did not propose to come forward with a scheme. There is a likelihood, however, that during the recess these members have changed their views, and that the Bills will now meet with a good deal of opposition. The President of the Board of Trade is understood to have in view a motion asking the House to confer powers of purchase upon the London County Council when the London and District Bill comes before Committee. In reference to the question of electric supply in London, Mr. C. Newton Russell, the Borough Electrical Engineer, of Shoreditch, and President of the Associated Municipal Electrical Engineers of Greater London, has sent a letter around to the Press, in which he calls attention to the extreme inconvenience and danger of supplying London from one large generating station, and instances the mishap at the Lots Road power station last week. On behalf of the Association he urges the re-introduction of the Supply of Electricity Bill put forward by the late Government in several sessions, which gives power to existing undertakers to associate for the purposes of mutual supply.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, OCTOBER 15TH.

Rugby Engineering Society.

8 p.m. Meeting in the Benn Buildings, High Street, Rugby. Mr. A. F. Bennett, the President, will deliver his address on "Notes on the Progress of Steam Engineering."

FRIDAY, OCTOBER 16TH.

International Congress on Electrical Units and Standards.

Banquet by the Lord Mayor at the Mansion House to the delegates.

Incorporated Municipal Electrical Association.

Official visit to the Manchester Electrical Exhibition.

Electrical Contractors' Association.

Quarterly Business Meeting at the Manchester Electrical Exhibition.

SATURDAY, OCTOBER 17TH.

Incorporated Municipal Electrical Association.

Council Meeting at the Manchester Electrical Exhibition.

Electrical Contractors' Association.

"Propagandist" Meeting at the Manchester Electrical Exhibition.

Rugby Engineering Society.

Visit to the Manchester Electrical Exhibition.

MONDAY, OCTOBER 19TH.

International Electrotechnical Commission.

12 noon. Meeting at the Institution of Electrical Engineers, Victoria Embankment, for the election of a President in succession to the late M. E. Mascart.

"Dynamicables."

7.30 p.m. Dinner at the Franco-British Exhibition, when the delegates to the International Conference on Electrical Units and Standards and the International Electrochemical Commission will be entertained.

THURSDAY, OCTOBER 22ND.

Institution of Electrical Engineers.

7 for 7.30 p.m. Annual dinner at the Hotel Cecil.

International Conference on Electrical Units and Standards.

Meetings of the International Conference on Electrical Units and Standards will be held on Friday, October 16th, and again on Wednesday, October 21st. The Technical Committee meet again this morning, and also on Monday and Tuesday, October 19th and 20th.

CORRESPONDENCE

THE ACCIDENT AT CHELSEA GENERATING STATION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The report of the mishap at the Lots Road generating station of the Underground Electric Railways Co. of London, and your leading article thereon, supply food for much consideration as to the efficiency (as regards reliability of supply) of the many large power stations now in use or in course of erection. You give as your opinion that sectionalisation of the system, however complete, never renders a station immune from temporary breakdowns. Whilst not disputing this statement, I would point out that a small alteration in the arrangement of the oil-switches would have certainly prevented such a mishap as occurred on the 3rd inst. It is obvious that, had the oil-switch above the defective transformer not been rendered useless by the short-circuiting of its leads, the sphere of action of the primary accident would have been entirely locally confined. Such a condition would undoubtedly have been realised, had the entering and leaving cables been completely separated by passing into and out of the switch compartments at opposite ends. I would also remark that, in the case of power systems possessing several inter-connected stations running in parallel, sudden transference of load, especially such a load as 25,000 kw. at 11,000 volts, from one station to another is very apt to cause surges throughout the whole system. Some of the American, and, at least, one of the English power companies have suffered severely from surges of this kind, and the remedy to complete "shut-downs" which you suggest may therefore be worse than the disease.

Yours truly,

OSWALD B. DAVIS.

HEATON, NEWCASTLE-ON-TYNE,
Oct. 13th, 1908.

METHODS OF CHARGING FOR LIGHTING CURRENT.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The advent and rapid introduction of metallic lamps in place of carbon lamps is resulting in greatly reduced consumption of electricity by individual consumers. In those towns where authorities and undertakers are largely dependent on revenue from current supplied for lighting purposes they are face to face with a difficult and somewhat serious problem. Not much has hitherto been said or written upon this subject, and it will be interesting to have information from various authorities as to how far their business has already been influenced and prejudiced by the use of the new lamps, and especially what steps are being taken to meet the temporary loss of profit. The difficulties of the situation are increased by the fact that many meters which have been in use for years registering current to carbon lamps are too large and not sufficiently sensitive to measure the reduced amount of current required for metallic lamps. For this reason there must be many instances where a small number of lamps (which are generally the long hour burning lamps) will not operate the meter at all; especially is this the case on alternating current supply mains where low voltage auto-transformers are used and left on the mains continuously. These transformers, giving, say, 25 volts, can be bought up to ·8 kwt. capacity, taking not more than 10 watts excitation on open circuit, and there must be many thousands of meters in use which are not capable of measuring this small amount of energy, with the result that the supply authorities are presenting the excitation energy to the user free of charge. Again, the revenue from consumers, by the introduction of metallic lamps and low voltage transformers may be reduced to, say, one-third the average amount obtained from carbon lamps; in face of this reduced revenue it will not pay the supply authority to take out the large and obsolete meters and replace them with meters of modern type; nor will new installations (especially in the case of small tenements) warrant any additional expenditure for meters or demand indicators if a profit is to be earned on the transaction. Thus the supply authorities are up against the pressing question as to how consumers who are small users of electricity are to be supplied at a profit, and the only sound business method appears to be to supply such consumers on fixed tariffs, such fixed tariffs to include the quota of standing charges plus the running costs based on an assumed maximum time of use, per day. Such a system secures the supply authorities from loss in every case, while the fact that the consumer has to-

Digitized by Google

furnish his own lamps—which are somewhat expensive—is a guarantee that he will not use his electric light wastefully. This system calls for a current limiter of a simple and cheap description, which ought to be purchasable for something less than 10s. each. To secure new consumers rapidly the existing regulations with regard to services, charges, double pole switches, cut-outs, and especially the stringent regulations in force as to wiring will have to be modified and brought into line with present day requirements, and it appears to me it is only upon these lines that the industry can hope to continue to flourish and make headway amongst all classes of consumers.

With a view to inaugurating a system of charging by contract I have instituted careful enquiries for a suitable current limiter and have succeeded in getting propositions from two firm only, both German, and investigations so far have not shown their instruments to be particularly well adapted for the work in view either as regards simplicity or cost. So far as my experience goes I forecast a healthy demand for such instruments in the near future, and shall be glad if this letter will result in manufacturers giving attention to their design and production. I also hope that my communication will elicit the views and experience of my colleagues on the points raised, which I submit are at the present time of vital and pressing importance.

Yours, &c.,

GEO. WILKINSON

Harrogate,
October 9th, 1908.

THE ACCIDENT AT THE GENERATING STATION OF THE LONDON UNDERGROUND RAILWAYS

ON page 524 of our last issue we described the breakdown which occurred on Saturday, October 3rd, at the generating station of the Underground Electric Railways Co., of London, at Lot's Road, Chelsea. The nature of the gear which was affected

FIG. 1.—VIEW SHOWING BRICK CHAMBER CARRYING GENERATOR CABLES TO OIL SWITCH CHAMBER ON FLOOR ABOVE.

will be made clearer by the accompanying illustrations, which are reproduced from photographs kindly sent us by Mr. J. R. Chapman, chief engineer to the company. The relative position of the apparatus in question can be seen from Fig. 1, which is taken from the main engine-room floor, where the turbo-generators are situated. The main 11,000 volts cables from each 5,000 kw. generator pass up from the floor in separate channels in the vertical brick pillar seen in the illustration to the main motor-operated generator oil switches on the first floor of the switchboard galleries. The main bus bars are in chambers on the second floor, not shown, and the feeder oil switches are on the third or top floor. All the feeders are provided with static dischargers of the non-arcing multi-gap type in the compartments shown in Fig 1 on the same floor as the main generator oil switches.

The current transformers, to the breakdown of one of which the accident was primarily due, are fixed to the cables within the pillar already mentioned, and are shown in Fig. 2. The arc and flame from the explosion of one of them drove through the porcelain tube insulators, through which they are taken through the concrete floor to the switch above, and short-circuited the cables leading to and from it. It speaks well for the construction of the switch, which was supplied by the British Thomson-Houston Co., that it was ready for service again the next morning. The resulting heavy surge caused all the feeder static dischargers to come into action, and these amply fulfilled their function of preventing damage to other apparatus on the system, although they were not able to recover after the heavy discharge, as they mostly bridged over and then remained earthed, so that the whole station had to be shut down. One of these static discharger panels is shown in Fig. 3. They are each 5 ft. long and have eight gaps of 0·0047 in. each and a carbon

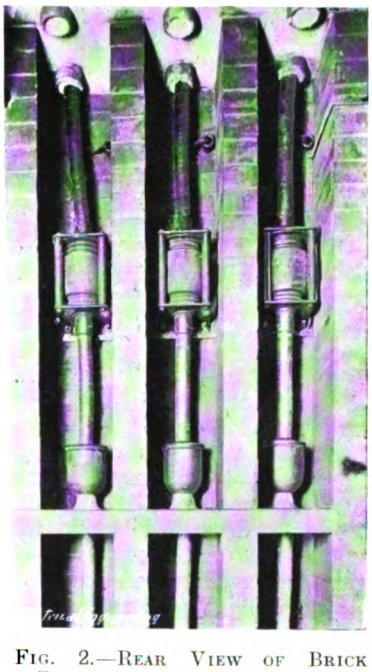

FIG. 2.—REAR VIEW OF BRICK CHAMBER CARRYING GENERATOR CABLES SHOWING SERIES TRANSFORMERS, EARTH STRIPS AND SECONDARY LEADS TO CONTROL BOARD. TRANSFORMER ON RIGHT-HAND PHASE FAILED.

FIG. 3.—STATIC DISCHARGE PANELS ON FEEDER CABLES. ASBESTOS BOARD COVER REMOVED.

resistance rod $\frac{3}{4}$ in. diameter and 33 in. long with a resistance of 0·375 megohm; 186 of these panels were affected and the clearing of the gaps naturally was a work of time.

AN ELECTRICALLY-DRIVEN REVERSING ROLLING MILL

THE first heavy reversing rolling mill in this country to be electrically driven is that at the works of Messrs. Dorman, Long & Co., at Middlesbrough, which has been equipped by the Electrical Co., Ltd., upon the Ilgner system, and which was inspected by the members of the Iron and Steel Institute during the meeting at Middlesbrough. The general principle of the Ilgner system of load equalisation by means of a flywheel is well known in connection with winding engines for mines, but it is equally suitable for other applications of power where the maximum considerably exceeds the normal load, and the peaks are of short duration. Briefly, the system consists in the employment of a motor generator coupled to a heavy flywheel switchgear. The field of the rolling mill motor is excited from the same exciting set, and remains constant except for the small variation mentioned below.

From the diagram of connections given below, the arrangement of the essential parts of the equipment can be seen. It will be noticed that the exciting set includes an additional generator, the field of which is excited by the main motor current. The object of this is to give a certain amount of compounding effect to both the generator and rolling mill motor fields by means of the auxiliary windings shown, and allows of a decrease of speed on sudden overloads, so as to keep the current within the limits for which the circuit-breakers are set.

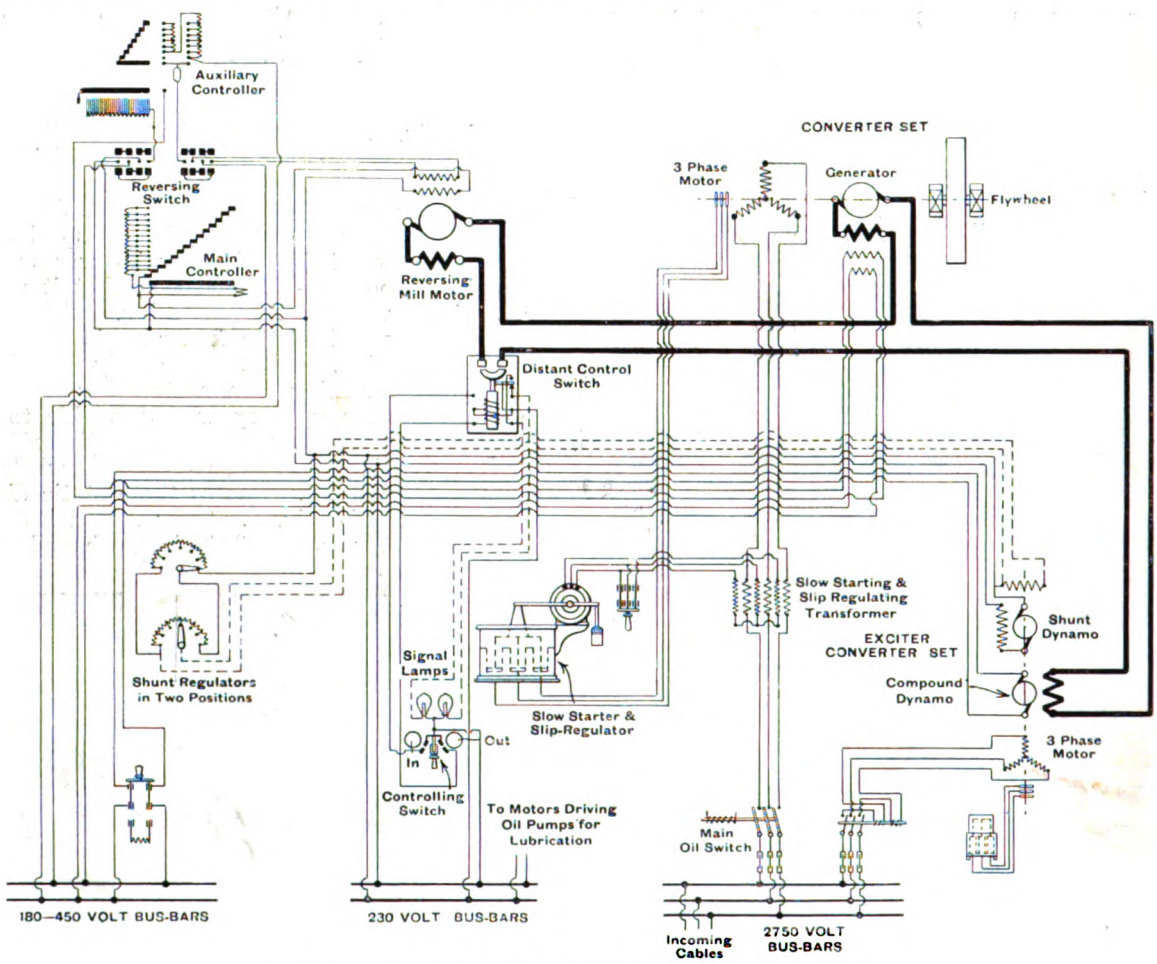

Diagram of Connections of Reversing Rolling Mill.

driven from the usual constant voltage supply, in this case alternating, and delivering continuous current to the rolling mill motor. The speed of the set is controlled by an automatic device described below, which causes it to slow down and give out energy when the load is heavy and regain its speed by absorbing energy when the demand for power is light. In this way, the demand from the power station can be kept steady, although enormous overloads can be negotiated. It is usual in most varieties of the system to control the voltage applied to the brushes of the rolling mill motor, and, therefore, its speed, entirely by varying the field of the generator attached to the flywheel in the way originally suggested by Ward Leonard. This is done in the present case, and the whole of the starting, stopping, and reversal is done by control gear in the generator field circuit, which is supplied from an auxiliary motor generator. The armature circuit of the rolling mill motor is thus practically without

One of the most important parts of the equipment is the "slip regulator," by which the speed of the motor driving the flywheel set is controlled. This consists of a variable resistance in the rotor circuit of the induction motor, which alters the amount of slip between its speed and that of synchronism, according to the speed required. The "slip regulator" consists of a liquid resistance, automatically governed by the "regulating motor." The liquid resistance consists of a tank filled with acidulated water, kept cool through circulation, into which three plates, the electrodes, dip. In their lowest position the electrodes are short-circuited. The electrodes are movable, on a shaft, and their weight is nearly balanced by a counter weight. The armature of the regulating motor, mounted on the same shaft as the electrodes, is movable through a certain number of degrees, and immerses them more or less in the liquid, as required. The rotor circuit of the three-phase motor of the

Digitized by Google

Ilgner set is connected to the three electrodes, and thus, through the action of the slip regulator, varying resistances are introduced into the rotor circuit, decreasing or increasing the speed of the motor. As long as the current in the mains remains below a certain value, the torque of the electrodes on the slip regulator shaft is greater than the torques of the counter weights and the regulating motor, but, a heavy load coming on, and the maximum value of the current in the mains being reached, the torque of the regulating motor overcomes the other torques, and the electrodes are slowly lifted, introducing resistance in the rotor circuit, and causing the flywheel to slow down and give up some of its stored energy. Conversely, when the demand is less than the normal for which it is set, resistance is cut out, and the flywheel allowed to regain its normal speed. The current demand from the mains is, therefore, kept practically constant, though the load on the rolling mill varies within very large limits.

The rolling mill motor at the Dorman, Long & Co. wire mills will momentarily develop upwards of 3,600 h.p., but the demand from the mains will be kept constantly at 950 h.p.

It should be pointed out that the actual number of units consumed per ton of rolled material will be slightly more than if the rolling mill motor were connected direct to the mains, but especially in case of a three-phase supply, the advantages of the system, as regards the control system and the equalisation of the demand, more than counterbalance this.

At Messrs. Dorman, Long's works, to which this system has been applied, the rolling mill contains two housings, with 16-in. rolls, and is built for rolling angles and small girders. The mill is directly coupled to the mill motor, a compound-wound continuous-current motor of 1,200 h.p., normal, and 3,600 h.p., maximum output, 600 volts, running at speeds up to 160 revolutions per minute; the maximum torque of the motor is 232,000 foot pounds.

The Ilgner set is situated near by, and consists of one three-phase motor of 950 h.p. continuous output, 2,750 volts, 40 periods, coupled directly to a continuous-current dynamo of 1,250/3,600 h.p. output, 600 volts. The two flywheels, each of 20 tons, are mounted on a separate shaft connected through a coupling to the motor generator shaft. By this arrangement it is possible to disconnect the flywheels in case they are not needed, i.e., if the maximum demand of the rolling mill motor at a certain work does not exceed 950 h.p. The Ilgner set runs at a maximum speed of 400 revolutions per minute, which speed is decreased by the automatic slip regulator to about 350 revolutions per minute.

The current for driving the set is taken from the mains of the Cleveland & Durham Electrical Power Distribution Co., Ltd.

The flywheel dynamo is provided with compensating coils on the Dèri system for the purpose of reducing the armature distortion, and thus securing an absolutely sparkless commutation at all loads with a fixed brush position.

The bearings of the flywheel shaft are water cooled, and the flywheels are housed in a massive sheet-iron case, in order to reduce the air friction, and accordingly the losses of the Ilgner set. All bearings are of the ordinary bush type, lined with white metal, and of very substantial dimensions, reducing the pressure per square inch to a very low figure. The lubrication is supplied by oil under pressure from either motor-driven pumps or a highly placed tank, to which the oil is conveyed by motor-driven pumps. In case of emergency, hand-pumps substitute the motor-driven ones. An electric alarm is provided which calls the attendants' notice should the oil supply fail.

In order to start the Ilgner set with its heavy masses, a special barring gear is provided consisting of a 15-h.p. motor with necessary gear, this being cut off automatically when the Ilgner set reaches a speed of three revolutions per minute. The flywheels, which are each of 14-ft. diameter, are equipped with a powerful water-cooled brake for the quick stopping of the set.

The exciter set consists of one three-phase motor, 80 h.p., 2,750 volts, 40 periods, coupled directly to two continuous-current dynamos, of which one serves to excite the fields of the dynamo and the mill-motor, and the other feeds a special compound winding, as already explained. The elevated operating platform, with the controller, is situated in full view of the mill. The control is effected by a single lever, and a small switchboard contains the necessary instruments.

THE MAWDSLEY ZONE DYNAMOS AND MOTORS

DURING the last few years, the weight and price per horse-power of both dynamos and motors have been considerably reduced, and this without any radical change in design. The reduction in weight has been obtained partly by more careful design, particularly with regard to the better proportioning of parts and windings, partly by improved methods of ventilation, and partly by increasing the permissible temperature rise. This reduction in the weight of the material employed permitted a reduction in price, and this latter no doubt has been furthered by the use of more economical methods of manufacture. In the case of continuous-current machines, the improved methods of ventilation were so effectual that a point was reached where, instead of heating being the limiting factor, it became necessary to adopt some expedient so as to avoid commutation troubles. The result of this was that interpoles were introduced. Interpoles, while considerably improving commutation, have, however, the disadvantage of increasing the number of parts in the machine, and of restricting ventilation. Furthermore, they do not prevent the distortion of the field due to armature reaction, which is accompanied with consequent excessive voltage between adjacent commutator segments and risk of "flashing over."

In the ordinary type of continuous-current machine, successful commutation may be obtained by reducing the self-induction or reactance voltage of the armature coils undergoing commutation.

Fig. 4.—"Zone" Machine.

Distribution of Leakage Flux.

Digitized by Google

or by artificial reversal of the current in these coils either by commutating in the fringe of the main pole or by the use of auxiliary or interpoles. The reactance voltage may be reduced by decreasing the number of turns of armature winding per commutator segment, and by shortening the length of the armature coil, especially that portion which is embedded in the iron of the armature core. As in practice not less than one complete turn per segment can be used and a certain length of core is necessary, it is obvious that a point is soon reached where it is impossible to still further reduce the reactance voltage by these means.

With regard to the second of the above methods, it is stated in most text-books that the brushes of a dynamo must be moved forward so that the magnetic fringe from the trailing pole tip may generate a reversing E.M.F. in the short-circuited armature coil. With carbon brushes, however, the advantage of this brush movement is not so much that the commutating zone is moved into a reversing field as that it is moved away from the flux from the leading pole, which owing to armature reaction is distorted in such a way that it, as it were, invades the commutating zone, which should be kept strictly "neutral." This flux, of course, increases the current in the short-circuited armature coil, with the result that there is sparking at the brushes. If this distortion could be prevented, "brush commutation," or the choking effect of the film between carbon brush and commutator surface would be sufficient in most machines to give sparkless running.

The type of machine manufactured by Messrs. Mawdsley's, Ltd., of Dursley, and known as the "Zone" dynamo, is designed so as to reduce the self-induction of the armature coils undergoing commutation, and also to prevent injurious distortion of the field. The field poles are usually cast solid with the yoke-ring, so as to save machining, laminated poles only being used in certain special cases. As will be seen in Figs. 2 and 5, they are bifurcated. This bifurcation has the effect of greatly throttling the cross flux due to the armature ampere-turns, and incidentally of shortening the path of the main flux, thus reducing the number of ampere-turns required for excitation. The field coils are wound so that the portion between the poles lies close to and parallel to the armature coils undergoing commutation. By this arrangement it is said that the field coil acts in a similar manner to the closed secondary of a transformer, reducing or choking the current flowing in the armature coil during the time it is short-circuited by the brush, or, in other words, reducing the self-induction and reactance voltage. We are informed that it has been found possible in these machines to commutate successfully with (calculated) reactance voltages three to four times higher than those considered permissible in the ordinary type of machine.

A further advantage is claimed in that injurious distortion of the field is prevented owing to the main field or magnetomotive force acting directly in the neutral zone instead of on each side. It is obvious that it is practically immaterial what path the lines of force take outside the neutral zone, whereas in the zone itself it is of the very greatest importance, and the controlling force should undoubtedly be at this point. The flux distortion in the ordinary type of machine is shown in Fig. 1, and in the Zone machine in Fig. 2. It will be seen that in the latter case the invasion, as it were, of the distorted field is repelled by the main field and the neutral zone kept "neutral."

Another advantage is claimed from the fact that in the ordinary machine magnetic leakage from the armature is disadvantageous and detracts from the flux efficiency, as shown in Fig. 3, whereas in the "Zone" system the space between the pole and the coil is practically added to the polar surface, as can be seen from Fig. 4, thus increasing the flux efficiency. In some sizes this increase in efficiency amounts to about 10 per cent., the wasteful magnetic leakage being practically nil. It will be seen that there is a certain flux in the teeth surrounding the short-circuited armature coils, the field coil acting in this respect as an interpole, without the disadvantages associated with an iron interpole, namely, increased magnetic leakage and reactance voltage.

Owing to the greatly increased stability of field and the prevention of distortion, these machines are specially adapted for high speeds, and where it is necessary to run with weak fields, as in the case of variable-speed motors. It is also unnecessary to increase the number of poles in order to reduce the armature ampere-turns per pole. This alone allows of considerable economies in copper and cost of construction. Messrs. Mawdsley's, Ltd., make machines up to 15 h.p. bi-polar, and over that size multi-polar, the 250 h.p. size having six or eight poles, according to voltage. The bi-polar type for small sizes has many advantages over the multi-polar form, not only as regards cost of manufacture and simplicity, but also as regards the brush gear.

It will be seen from the drawings in Fig. 5 that ventilation

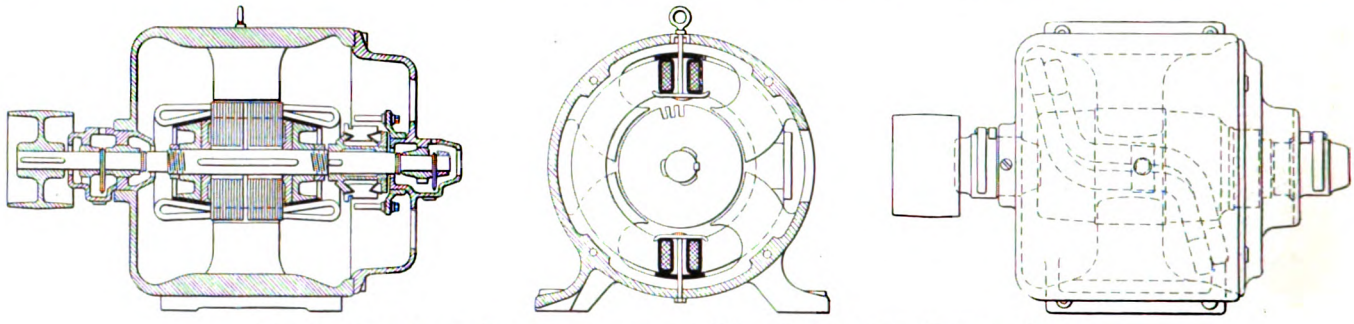

Fig. 5.—Method of Construction of the "Zone" Two-Pole Magnetic System.

Fig. 6.—Totally Enclosed "Zone" Motor.

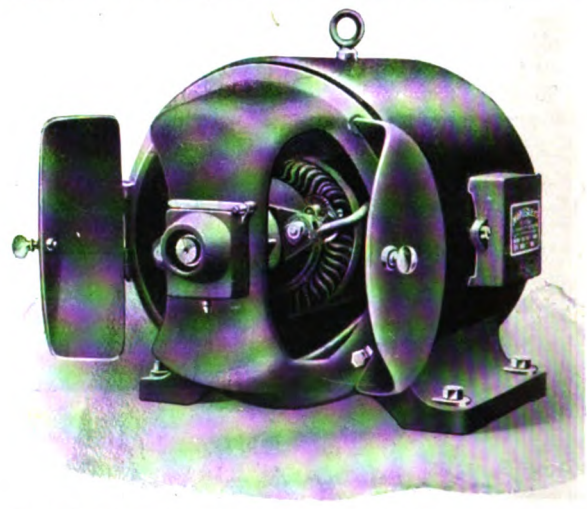

Fig. 7.—Totally Enclosed "Zone" Motor (Covers open.)

Digitized by Google

is well provided for, owing to the field coils being surrounded by air and to the large space in the centre of the field pole. It is also possible to use low inductions and large airgaps without unduly increasing the manufacturing cost, this resulting in quiet and cool running machines. Two views of a complete totally enclosed bi-polar motor are given in Figs. 6 and 7. In the latter the covers are shown open. On account of the fixed position of the neutral zone, practically sparkless commutation with fixed brushes at all loads is obtained. Indeed, we are informed that the machines will run sparklessly with a lead of the brushes in the case of motors and a lag in the case of dynamos, thus permitting a 50 per cent. speed variation by merely moving the brushes. We have also been informed that practically sparkless collection has been obtained from this type of machine with a ratio of field to armature ampere-turns of only 0·6, and a calculated reactance voltage of 9·2.

INTERNATIONAL CONFERENCE ON ELECTRICAL UNITS AND STANDARDS

THE International Conference upon Electrical Units and Standards, which has been called together by the British Government, commenced its sittings on Monday in the rooms of the Royal Society at Burlington House, Piccadilly, London. As stated in our last issue, when the full list of delegates was given, the main object of the Conference is to obtain international agreement on the three electrical units, the ohm, the ampere, and the volt, so that the realisation of these units in all the countries of the world shall be as nearly as possible identical. The Secretaries to the Conference are Mr. W. Duddell, F.R.S., and Mr. M. J. Collins, of the Board of Trade.

The proceedings were opened by an introductory address by Mr. Winston S. Churchill, M.P., the President of the Board of Trade.

Mr. CHURCHILL said that 14 years had passed since the last International Congress, at which definite resolutions were passed as to electric units. The resolutions of Chicago in 1893, based as they were upon the conclusions reached at Edinburgh in the previous year, had formed the starting point of legislation in various countries. The 14 years that had elapsed had seen many changes in the science of electric measurement, and our knowledge had so greatly increased that specifications and definitions which were thought to be accurate 14 years ago, or at any rate sufficiently accurate for practical purposes, had been shown—at least, so far as one of the important units is concerned—to be palpably in error: at the same time, the demand for exact measurement had become more vehement, and the need for uniformity of standard not merely in any one country, but throughout the civilised world, had become clear and urgent. Mr. Churchill then referred to the deaths among leaders in the science of electric measurement which had taken place since the Chicago Congress, and made special mention of Kelvin and Mascart. The present Conference, he continued, owed its inception to the resolution passed at St. Louis in 1904. That resolution not only confirmed the necessity for a more practical and perfect uniformity of electrical standards through the labours of an International Commission, but further expressed the hope that that Commission might ultimately be preserved in a permanent form. His Majesty's Government had responded with precision and cordiality to the proposal to convoke an International Conference in London, and the result of their invitations had been most gratifying, every country of importance in the civilised world having sent its foremost workers in the branches of science concerned. The function of the Conference was to define in clear and accurate expression those scientific quantities in terms of which electric energy was bought and sold, and, if possible, to embody its conclusions in draft articles which might form the basis of legislation and administration so far as electric units and standards are concerned. They must not rest satisfied merely with providing that the electric standards of the world shall be identical in 1908; their steps must be directed towards securing a permanent uniformity. The changes required were, however, small. They had only to make exquisite and harmonious adjustments of an international system of units and standards, which had already almost an international language of its own. The first duty of a Conference of this nature was to determine its rules of procedure. On this point they had the precedent of the recent Conference on Wireless Telegraphy at Berlin to guide them. The draft rules of Procedure which had been circulated among the delegates were based on those accepted at Berlin with merely those changes which were requisite to adapt them to the present Conference.

On the suggestion of Mr. Churchill, these rules were adopted. The principal object of these rules is to regulate the procedure of the meetings and deal with the voting power.

Mr. CHURCHILL, continuing, said that, in accordance with the rules just adopted, and as representing His Majesty's Government which has summoned this Conference, he nominated Lord Rayleigh, President of the Royal Society of London, as President of the Conference.

Lord Rayleigh having taken the chair, the following vice-presidents were elected:—

Dr. W. S. Stratton, Director, Bureau of Standards, Washington; Dr. Viktor Edler von Lang, President of the Commission of Weights and Measures, Vienna; Professor S. A. Arrhenius, Nobel Institute, Stockholm; M. Lippmann, Member of the Institute and Professor at the Sorbonne; Dr. Warburg, President of the Imperial Physico-Technical Institute (Germany); M. Egerow, D.Sc., Director of the General Chamber of Weights and Measures.

The next business was to appoint a Technical Committee, provided for in the rules of procedure. This Committee has the duty of considering in detail draft specifications of the ohm, the ampere, and the volt, after the Conference has accepted the principle of certain resolutions on these measurements. The following is the list of delegates elected to the Committee:—

Dr. S. W. Stratton, Director, Bureau of Standards, Washington; Dr. Henry S. Carhart, Professor of Physics at the University of Michigan; Dr. E. B. Rosa, Bureau of Standards, Washington; Monsieur Gerard, Director of the Montefiore Electro-Technical Institution, and President of the Consultative Commission on Electricity; Prof. S. A. Arrhenius, Nobel Institute, Stockholm; Monsieur Lippmann, Member of the Institute and Professor at the Sorbonne; Dr. Warburg, President of the Imperial Physico-Technical Institute; Dr. Jaeger, Member of the Imperial Physico-Technical Institute; Dr. Lindeck, Member of the Imperial Physico-Technical Institute; the Right Hon. Lord Rayleigh, President of the Royal Society; Dr. R. T. Glazebrook, Director of the National Physical Laboratory; Mr. A. P. Trotter, Electrical Adviser to the Board of Trade; Prof. Antonio Roiti, of Florence; Dr. H. Haga, Professor at the University of Groningen; Dr. Fr. Weber, Professor at the Swiss Polytechnic School at Zurich; Prof. Threlfall, Australia; Major P. Cardew, Electrical Adviser to the Crown Agents for the Colonies; Dr. Nerville; Dr. Benoit; Monsieur Egerow, D.Sc., Director of the General Chamber of Weights and Measures; Dr. Pierre Chappuis, Basle; Dr. Kusminsky, Inspector of Commission of Weights and Measures, Vienna. Subsequently Dr. Osuko Asano, Official Expert of the department of Communication, Tokyo, and M. Clément, Secretary of the Consultative Commission on Electricity, were elected for Japan and Belgium respectively.

The meetings of this Committee may be attended by all the delegates, who may take part in the discussions, but only the members of the Committee have the right to vote.

On Monday, the agenda concluded with the consideration of the principle of certain regulations relating to the first primary standard, the ohm. Before dealing with these, however, we give the text of a specification for the international ohm which has been circulated among the delegates as forming a basis for discussion, and also some historical information on the subject.

SPECIFICATION OF THE INTERNATIONAL OHM.

The International Ohm is the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice, 14·4521 grammes in mass, of a constant cross-sectional area, and 106·300 centimetres in length, arranged in accordance with the following specification.

The column of mercury shall be of circular section, or nearly so, and shall be contained in a tube of suitable glass which has been carefully annealed. The tube shall be straight to the eye, and the maximum variation in its area of cross section shall not

Digitized by Google

exceed 2 parts in 100. The tube is to be carefully calibrated and the correction for its conicality determined.

In determining the weight of mercury contained by the tube when filled at the temperature of melting ice, the column of mercury is to be bounded by planes at the terminal cross sections of the tube. The tube should not be unduly heated, and it should be filled with mercury by exhaustion of air.

The axial length of the tube should be measured at 0° C., if possible, otherwise the coefficient of expansion of the glass should be determined and the axial length of the tube at 0° C. calculated from axial measurements made very near to that temperature. To facilitate measurements of the axial length, the ends of the tube should be ground very slightly convex.

For the electrical measurements the ends of the tube are to be connected to spherical bulbs of glass; the slightly convex ends of the tube form approximate portions of the internal spherical surface of the bulbs. Each bulb is to be provided with current and potential leads, the point of entry of the former being at the opposite end of a diameter of the bulb from the end of the tube. The potential lead shall be situated in a plane midway between the point of entry of the current lead and the end of the tube, and at right angles to the line connecting them.

Contact with the mercury shall be made by means of platinum wires.

The diameter of a bulb is to be from 30 to 33 times the diameter of that end of the tube to which it is connected.

If L is the axial length in centimetres of the mercury column contained by the tube at 0° C., W the weight of the column in grammes, and c the conical factor for the tube, the resistance of the column at 0° C. is

$$c\,\frac{L^2}{(106{\cdot}300)^2}\cdot\frac{14{\cdot}4521}{W} = 0{\cdot}001278982\,c\,\frac{L^2}{W}\text{ international ohms.}$$

When the spherical bulbs are fitted to the ends of the tube and the whole filled with mercury, if r is the mean radius of the tube and r_1, r_2 the mean radii in centimetres of the terminal sections, the resistance at 0° C. between the potential leads is

$$0{\cdot}001278982\,\frac{L^2}{W}\left\{c + \frac{0{\cdot}80r^2\left(\frac{r_1+r_2}{r_1r_2}\right)}{L}\right\}\text{ international ohms}$$

correct within one per cent of the added resistance

$$0{\cdot}001278982\,\frac{L}{W}\left\{0{\cdot}80\,r^2\left(\frac{r_1+r_2}{r_1r_2}\right)\right\}$$

The electrical measurements are to be carried at 0° C., the tube and spherical vessels being surrounded by melting ice and about 15 centimetres below the upper surface of the ice. The connecting wires employed for the current and potential leads must be thin, so that the flow of heat through them to the mercury shall be insufficient to warm the mercury so as to produce appreciable error.

The insulation resistance between the mercury column and the ice surrounding the tube must not be less than ten million ohms.

The current employed in comparing the mercury resistance with other resistances shall be limited by the condition that the mercury shall not be warmed sufficiently to produce appreciable error.

The mean of at least five tubes must be taken to determine the value of the mercury unit.

The mean of at least three fillings shall be taken as the value of the resistance of a tube.

The Ohm (10⁹ C.G.S.) and the International Ohm.

At the International Congress of Electricians held in Paris in 1881, the C.G.S. system was first internationally adopted for electrical measurements, and it was resolved that the ohm should be represented by a column of mercury, 1 sq. mm in section at 0° C., the length of the column being left for a Commission to determine.

The next International Conference for the determination of electrical units was held in Paris in 1882, but the Commission was not then able to fix the numerical value of the ohm in terms of the mercury column.

In 1884 the International Conference at Paris resolved that the "legal" ohm is the resistance of a column of mercury of 1 sq. mm. cross section and 106 mm. in length at 0° C. The mean of 15 values for the length of the mercury column was 105·97 cm.

In 1893, at the Chicago Congress, the length for the mercury column was stated as 106·3 cm., and the mass of mercury filling the tube at 0° C. was given as 14·4521 grammes. Within a few parts in 100,000 the cross section at 0° C. of such a tube is certainly 1 sq. mm.

Since the Chicago Congress, Austria, Canada, France, Germany, Great Britain, and the United States have legislated on the ohm. The Austrian and Canadian definitions are practically the same as that at Chicago. In Austria it is stated that the ohm "may be considered equal" to a particular column of mercury.

The first resolution put before the Conference was proposed by Mr. A. P. Trotter, Electrical Adviser to the Board of Trade, and read as follows:—

"The Conference agrees that, as heretofore, the magnitudes of the fundamental electric units shall be determined on the electro-magnetic sytem of measurement with reference to the centimetre as the unit of length, the gramme as the unit of mass, and the second as the unit of time.

"These fundamental units are (1) the Ohm, the unit of electric resistance which has the value of 1,000,000,000 in terms of the centimetre and second; (2) the Ampere, the unit of electric current which has the value of one-tenth (0·1) in terms of the centimetre, gramme, and second; (3) the Volt, the unit of electromotive force which has the value 100,000,000 in terms of the centimetre, the gramme, and the second."

Mr. Trotter, in proposing this resolution, said that the C.G.S. system was so universally accepted in electrical science and in the electrical industry that the ohm, the ampere, and the volt occupied a position of a more fixed and international character than was enjoyed by any other unit of measurement; more fortunate, even, than the metre and the kilogramme, in that they had no rivals. The system was a foundation worthy of supporting the monument which had been raised to the great men whom we honoured by recalling the names of Ohm, Ampere, and Volta.

The resolution was then put to the Conference and carried unanimously.

Mr. Trotter next proposed the following, which was read in conjunction with the previous resolution:—

"As a system of units representing the above, and sufficiently near to them to be adopted for the purpose of Trade and Commerce, the Conference recommends the adoption of the International Ohm, the International Ampere, and the International Volt defined according to the following definitions."

As a decision on this depends upon the result of other resolutions to come, voting upon this resolution was postponed.

Dr. Warburg (Germany) then put the two following resolutions before the Conference:—

"The International Ohm shall be defined as the resistance of a specified column of mercury."

"The International Ohm is the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice, 14·4521 grammes in mass, of a constant cross-sectional area, and of a length of 106·300 centimetres. To determine the resistance of a column of mercury in terms of the International Ohm, the procedure to be followed shall be that set out in Specification A attached to these resolutions." [This latter refers to the specification given above.]

Dr. E. B. Rosa (United States) moved that the length of the mercury column should be 1 metre, and that the amount of mercury employed should be 12·7898 grammes, so that the resistance to the column should be the same as that proposed in Resolution IV. In support of this amendment it was pointed out that this would bring us back to the length of the Siemens unit. It is probable that if Siemens had specified the weight of the mercury instead of the cross section of the tube we should never have changed from 100 cm. to the present 106·3, and, further, that if in the future it should be necessary to alter the international ohm it would only be necessary to change the mass of mercury, and not the length and the mass as is necessary with the present definition. In any case, he suggested that the point should be referred to the Technical Committee. The British and German delegates objected to the change, but, on a vote, the matter was referred to the Technical Committee by 16 votes to 5, Great Britain voting against, two countries not voting.

On Tuesday, the Technical Committee, of which Dr. R. T. Glazebrook has been appointed chairman, met at Burlington House, and considered in detail the specification of the ohm given above. The final result of their deliberations will be presented in the form of a report at the close of the conference. The suggestion by Dr. Rosa that the specified length of the column of mercury should be one metre, as set out above, was considered, but eventually the Committee negatived the proposal.

On Wednesday the meeting of the conference was taken up with a discussion of the following resolution, which was proposed by Dr. Glazebrook, and seconded by Dr. Warburg: "That the ampere is the second primary unit." In proposing this resolution, Dr. Glazebrook emphasised the superiority of the silver voltameter as an instrument for primary determinations over any form of standard cell.

Digitized by Google

Professor Lippmann introduced a counter proposal recommending the volt as the second primary unit as determined by the Weston cell in accordance with a detailed specification which he brought forward. The American delegates also spoke in support of this counter-proposal and the discussion was continued at considerable length. Finally, however, Professor Lippmann's proposal was negatived and the motion adopting the ampere as the second primary unit was carried.

Further resolutions regarding the exact definition of the ampere and the use of the Weston cell as a secondary standard were adopted subject to a modification in the latter, to consider which a special meeting of the Technical Committee was held in the afternoon.

On Monday the delegates were entertained at dinner at 6.30 p.m. by the President and Members of the Royal Society Club, and at 8.30 p.m. they attended a reception by the President and Council of the Royal Society. Visits were paid on Tuesday to the National Physical Laboratory and on Wednesday to the Imperial College of Technology, South Kensington. Today the Lots Road Power Station will be visited and in the evening an official banquet will be given on behalf of the Government at the Ritz Hotel, Piccadilly. On Friday, October 16th, the Lord Mayor of London will give a luncheon at the Mansion House; a visit to Cambridge upon the invitation of Trinity College will be paid on Saturday, October 17th; the Central Telephone Exchange, Carter Lane, will be visited at 3.30 p.m. on Monday, October 19th, and in the evening the delegates will dine with the "Dynamicables" at the Franco-British Exhibition; Greenwich Observatory will be visited on Tuesday, October 20th, and an opportunity will be afforded at the same time of viewing the Greenwich L.C.C. power house. On Thursday, October 22nd, the delegates have been invited to the annual dinner of the Institution of Electrical Engineers.

Further meetings of the Technical Committee will be held this morning, and also on the 19th and 20th inst.; the full conference meets again on Friday to receive the interim report of the Technical Committee, after which it will consider the steps necessary to secure uniformity of the standards in the future. The final meeting of the conference is on Wednesday, October 21st, when a final report of the Technical Committee will be received.

LOCAL NOTES

ACTON: *Bulk Supply.*—A conference was held on Friday between representatives of the District Council and the Metropolitan Electric Supply Co. with regard to the terms upon which the Council is supplied with electrical energy in bulk. It is understood that on Friday a propostion was made on behalf of the company, and same will be considered by the Committee of the Council, who are in charge of the electrical undertaking.

BACUP, HASLINGDEN & RAWTENSTALL: *An Ancient Provisional Order*—Bacup is celebrated for being the town which holds the oldest Electric Lighting Provisional Order. They obtained their order in 1890, and have sat upon it ever since. Recently these three authorities, which are not far from one another, have been in treaty with the Lancashire Power Co. to supply them, and the company could only consider it worth while to lay a main to them in the event of all three taking power. Rawtenstall eventually decided, however, to build its own power station. They have now obtained the necessary sanction from the Local Government Board for a loan, and the power-house is in course of erection. Bacup will take power in bulk from Rawtenstall both for lighting and power purposes, and for the tramways in the district, which are to be electrically equipped. The Rawtenstall Corporation are to reconstruct the system of the Rossendale Valley Tramways Co. with both Rawtenstall and Bacup, and will work the steam tramways until the electrification is accomplished, taking all the receipts meanwhile. The sum necessary for the purchase of the tramways in Bacup will be lent by Rawtenstall.

BARKING: *Transfer of Electrical Undertaking.*—The promotors of the London and District Electric Supply Bill have accepted the Council's terms for the transfer of the local electric light undertaking, and a draft agreement has been prepared for inclusion in the Bill now before Parliament.

BENWELL & FENHAM: *Electric Lighting.*—It was stated at the last meeting of the Newcastle Corporation that an arrangement made by the Benwell Council a short time ago with the Newcastle & District Electric Lighting Co. had been declared *ultra vires*, but that as many houses had been wired in the expectation of a supply of electricity being available, the Newcastle Corporation had made arrangements with the District Co. to give a supply. The Corporation will take over the supply arrangements in 1922 at 5 per cent. per annum depreciation.

BOURNEMOUTH: *Tramway Receipts.*—The traffic returns upon the Corporation tramways for the summer season just ended show a marked decrease on the corresponding period of last year, the receipts amounting to £35,849, against £37,749, and the number of passengers carried was 5,895,052, against 6,041,278 last year.

BRADFORD: *New Tramways.*—The Tramways Committee are considering the extension of the tramways in various directions, and it is probable that a Bill will be deposited in Parliament this session.

BRAUNTON (N. DEVON): *Electricity Supply.*—Messrs. Crompton & Co. are interested in a scheme for electric lighting in this district.

BURNLEY: *Proposed Electrical Omnibus Service.*—The London Electrobus Co. have applied to the Burnley Tramway Committee for a licence to open a service of electric omnibuses in the borough, where no electric tramway service is afforded. A recommendation has been made that in the event of the application being acceded to, traffic should be confined to strictly suburban routes, and the Town Clerk has informed the company of the Corporation's powers to run and work motor omnibuses.

BURTON-ON-TRENT: *Football by Electric Light.*—A football match was played at Burton by the aid of electric light on Monday evening. This was accomplished by using ten of the Electrical Co.'s 10-amp. flame arc lamps, four being used on either side of the ground, and one at each end over the goals, the grand stand being illuminated by five 50-c.p. Osram lamps. The arc lamps were run in series directly off the trolley wires at 520 volts. The match in question was an important one in the first division of the English Football League.

CAMBERLEY: *Electric Lighting.*—The Aldershot Gas & Water Co., have asked the Council for its approval to its application for an Electric Lighting Provisional Order for this district.

CARDIFF: *Wiring Consumers' Premises.*—The Town Clerk has reported that the necessary powers to wire consumers' premises, and hire out electric motors can only be obtained by Act of Parliament. The matter has been referred to the Parliamentary Committee with a view to a clause, or clauses, being inserted in the next Bill to be promoted in Parliament empowering the Corporation to undertake the work.

CLECKHEATON: *Spen Valley Tramways.*—A conference has taken place at the Board of Trade Offices in connection with an application of the Yorkshire Woollen Tramways Co. regarding the cessor of its powers in respect of the unconstructed portion of the line, authorised by the Spen Valley Light Railways Extension Order. Mr. G. R. Askwith, Assistant Secretary to the Board of Trade, who heard the inquiry, was informed that a scheme of light railways is under consideration which includes the linking up of Leeds with Halifax, *via* Cleckheaton and Brighouse, and that an application will be made to Parliament for powers in connection with it. In view of these facts the application of the company for cessor of powers was adjourned until January 31st, 1910, to enable the scheme in question to be put before Parliament.

ELLAND: *Tramways.*—The Town Council has received offers from the Huddersfield Corporation and the West Riding Tramways Co. for the construction of tramways in their district. That of the company appears to be the more favourable to the Council.

FALMOUTH: *Trolley Omnibuses.*—A scheme for the provision of trolley omnibuses through the town and along the sea front is being considered.

FARNHAM: *Overhead Wires.*—The Council is still negotiating with the Farnham Electric Light & Power Co. for the erection of overhead wires for lighting purposes. The parties have been unable to come to any agreement upon a general scheme, and it has been decided that the company shall submit to the Council for its approval the position of every standard before its erection.

FELIXSTOWE: *Electricity Works.*—In connection with the Council's purchase of the undertaking of the Suffolk Electric Supply Co., Mr. R. P. Wilson, the Council's consulting engineer, has reported upon the use of Diesel oil engines in connection with the reconstruction of the works, and recommends their adoption.

Digitized by Google

FORMBY: *Electric Lighting Provisional Order.*—The Council has agreed to transfer the Electric Lighting Provisional Order to the Formby & Freshfield Electric Lighting Co.

GATESHEAD: *Purchase of Tramways.*—In return for a suggestion by the Council that they should carry out certain extensions, the Gateshead and District Tramways Co. propose that the date of the exercise by the Council of their powers of compulsory purchase should be postponed for ten years. The Town Improvement Committee offered an extension of eight years from August 12th, 1922, as the period before compulsory purchase, and the company has agreed to this.

GLASGOW: *Tramway Finances.*—A recommendation by the Tramways Sub-Committee on Finance that a contribution of £17,500 be made by the Tramway Department to the Common Good has been adopted by the Tramways Committee.

Tramway Brakes.—In consequence of the accident that occurred in the High Street on January 3rd last, and the report by Colonel Yorke, in which he made suggestions with regard to brakes and sandboxes, the Tramways Committee has recommended that all cars be fitted with additional devices for sanding the tramway rails in accordance with a proposal by Mr. J. Dalrymple, the General Manager. An investigation is also to be carried out as to the method of operating the brakes on the cars.

GREENOCK: *New Tramway.*—In connection with a new street, the tramway company will in all probability lay a new tramway in order to provide a much needed additional outlet to the surrounding district.

HAMBURG: *New Telephone Exchange.*—According to a British Consular report, the concentration of the Hamburg telephone system in the newly-erected Telephone Exchange Building has not yet been finally accomplished, and in the meantime complaints as to the unsatisfactory service have rather increased than diminished. It is hoped here that not only the changes still in progress (that is to say the final arrangements of the central office and the complete substitution of underground for overhead wires) will be brought to an end without further delay, but that a well-trained and sufficiently numerous staff of employés will be at the service of the public in order to cope with the continually increasing demands made upon the telephone system.

HANWELL: *Condition of Tramway Track.*—The Commissioner of the Metropolitan Police has forwarded to the District Council the report of the local inspector on the condition of the tram track in Hanwell, in which he states that almost invariably it has been found that the noise was due rather to the condition of the track than the cars. The Commissioner adds that he has no control over the condition of the track. The Council have decided to forward a copy of the report to the Board of Trade, requesting them to take the necessary steps to require the tram company to put the track in proper condition, which, in their opinion, can only be done by relaying the whole of the track in Uxbridge Road.

HASLINGDEN: *Tramways Inspection.*—On Thursday, Major Pringle inspected the one mile of electric tramways in the Haslingden borough from Commercial Hotel to the Rawtenstall boundary. This length completes the reconstruction in the borough.

HEREFORD: *Electricity Tariffs.*—A report by the Electricity Committee for the adoption of the two-rate meter system of charging has been passed.

HOVE: *Electric Light Charges.*—Mr. Sims Williams, the Board of Trade Commissioner, who has for some time past, at long intervals, been hearing evidence in connection with the application of the Corporation, to compel the Hove Electric Light Co. to reduce its charges, has now completed his investigation, and will make his report to the Board of Trade in due course.

HYTHE: *The Tramway Scheme.*—The National Electric Construction Co. has notified the Hythe Council of its intention to apply to Parliament in the ensuing session for a Bill to amend the Folkestone, Sandgate, and Hythe Tramways Bill of 1906, by substituting the overhead system for the surface contact system. In a long communication, the Parliamentary Agents informed the Council that in view of the very onerous obligations put upon the promoters by the local authorities, it was at one time the serious intention to abandon the whole scheme. They are willing, however, to proceed with the Bill referred to, provided the Folkestone, Sandgate, and Hythe Councils are willing to meet them in the matter of terms.

IPSWICH: *Crosthwaite Furnaces.*—On page 500 of our issue for October 1st we mentioned that the Electric Lighting Committee anticipated a saving of £1,200 per annum by the adoption of an offer by the Crosthwaite Fire Bar Syndicate, Ltd., to fit their furnaces to the power station boilers. We are informed that this figure should be £400 per annum.

LEICESTER: *Electricity Accounts.*—At the meeting of the Town Council last week the report of the Electric Light Committee dealing with the past year's working of the electrical undertaking was adopted. The total expenditure amounted to £6,698, and the gross revenue to £15,847. After meeting interest and sinking fund charges, there was a net profit of £1,951, which, added to the balance brought forward, leaves a net profit of £2,739.

LEITH: *Electricity and Tramway Estimates.*—The estimates in connection with electricity department for the year ending May 15th next, show a surplus of £2,955. Upon the tramways undertaking the estimates show a probable deficit of £2,696. From January 1st next, the charge for electricity for lighting purposes will be reduced to 3d. per unit.

LIVERPOOL: *Lister Drive Steam Turbines.*—At the meeting of the Liverpool Council last Thursday, the report of Mr. A. Bromley Holmes, the Consulting Engineer to the Corporation, upon the Westinghouse turbines at the Lister Drive Power Station, was adopted after a lengthy discussion, in which a good many personalities were indulged in.

Trolley Omnibuses.—We understand that the Tramways Committee have under consideration the proposed adoption of trolley omnibuses.

LONDON: *Battersea: London Electric Power Bills.*—Counsel has been briefed in opposition to the London and District Electricity Supply Bill and the London Electric Supply Bill, the costs at present incurred being £250.

St. Pancras: Advantages of Cheap Electric Supply.—Having regard to the obligation imposed by Patents and Designs (Amendment) Act, 1907, with regard to patents being worked in this country, the Borough Council is issuing a circular in English, French, and German, calling attention to the advantages of St. Pancras as a manufacturing centre, especially in regard to the facilities for cheap electric power.

Paddington: Opposition to Power Bills.—The Borough Council, upon the recommendation of the Legal and Parliamentary Committee, has presented petitions against the London & District Electric Power Bill and the London Electric Supply Bill.

Woolwich: Tramways to Eltham.—In regard to a request by the Borough Council that they should include in the programme of works for the coming year the construction of the authorised tramways from Woolwich to Eltham, the Highways Committee of the London County Council state that they are giving careful consideration to the question, but think it advisable to apply for an extension of time for the construction of these lines. The Borough Council have written a letter to the County Council expressing their regret that this should be necessary.

Honor Oak: Proposed Tramways.—A deputation representing the Honor Oak Park and Brockley Tramways Committee waited on Thursday on the Highways Committee of the London County Council to urge the consideration of the tramway authorised from Lewisham High Road through Brockley to Forest Hill. Mr. Whitaker Thompson, the Chairman of the Highways Committee, replied that capital expenditure was the crux of the matter, and if it were possible to reduce this by the construction of a single line with passing places, so as to decrease the cost of street widenings, there would be some likelihood of the tramway being constructed next year.

LOUGHBOROUGH: *Electrical Finances.*—A special sub-committee, which was recently appointed to inquire into the finances of the electrical undertaking, there having been an adverse balance on the last year's working of £2,527, recommends that an independent engineer should be called in to report upon the working of the department.

MANCHESTER: *Mutual Telephone Syndicate.*—The resolution referred to in our last issue, that a special committee be appointed to consider and report on the position of the Mutual Telephone Syndicate, Ltd., and as to whether or not any payment should be made by the Corporation to reimburse to some extent the expenditure incurred by the Syndicate in their efforts to promote a cheaper telephone service for the city, was passed at the meeting of the City Council on Thursday last week.

MIDDLESBROUGH: *Electric Supply.*—Mr. H. M. Taylor, Electrical Engineer, reports that in consequence of the increased demand on their power station this winter, the Council will be compelled to generate to the extent of 900 kilowatts from their own plant, in addition to the power they will take from the power company.

MIRFIELD: *Electric Tramways.*—The Yorkshire (Woollen District) Electric Tramways, Ltd., have communicated with the Local Ratepayers' Association, stating they are unable to entertain a proposal to extend the tramways through Mirfield.

OXFORD: *Tramway Question.*—The National Electric Construction Company have finally decided that the Dolter service contact system will not be suitable for the city of Oxford, in face of the Corporation resolution that they are not satisfied with the working of the system in other towns. A communication has been sent to the Corporation offering to instal the conduit system in the centre of the town, and the overhead system on the outskirts, if the Corporation, on account of the extra cost incurred, can see their way to reduce the rental to £800 per annum.

PENRITH: *Electric Lighting.*—A company has been formed with a capital of £7,000 to acquire the Council's Electric Light Provisional Orders of 1900 and 1907.

PRESTON: *Tramway Undertaking.*—In their annual review of the Corporation accounts, the borough elective auditors point out that, after charging interest and sinking fund, the net revenue amounts to £3,194 for the past year, against £5,568 of the previous year. They mention, however, that a sum of £1,200 has been charged to revenue for the conversion of 10 open top-deck cars to covered top-deck cars. The total receipts show an increase of £816, whilst the working expenses have

Digitized by Google

increased by no less than £2,177, and the auditors express the opinion that, judging from the accounts for the two past years, the income would appear to have reached its maximum with the present system, but there is little doubt that there will be further increases in the working expenses. The reserve fund of the undertaking now stands at £13,102. The total expenditure to date amounts to £187,269.

ROCHDALE: *Electrical Charges.*—Although the electricity charges have just undergone special consideration by the Electricity Committee, an effort was made at the last meeting to secure a still further reduction. A resolution to this effect, however, resulted in five voting for it and 35 against it.

SALFORD: *Electricity Contracts.*—At the meeting of the Corporation on Thursday, a request was made by one of the Councillors for particulars of all special agreements entered into by the Electricity Committee, in which prices were charged less than the ordinary scale. It was stated in reply that the provision of such information rested with the Committee, and no definite decision was come to.

SALONICA (TURKEY): *Electric Tramway.*- A British Consular report states that the widening of the quay by 26 ft., which began in 1903, is at last finished; and though the diminutive parapet aligning the sea-side pavement fails in its object, the road is now broad enough for all kinds of traffic, including the newly-established electric tramway. The rolling-stock, imported from the United States, consists of 25 cars, which have cost £720 each. They accommodate 36 persons, including those standing on the platforms outside. A large generating station has also been built containing two 200 h.p. gas-driven dynamos and one 800 horse-power oil engine. The electric tramway service of Salonica, as well as that of the horse-drawn tramway which preceded it, is due to Belgian enterprise. It remains to be seen whether electric light will be installed by the municipality or by private persons, who seem to be deterred by fear of the heavy initial expenditure.

SOUTH AFRICA: *New Rand Power Scheme.*—A scheme is under consideration for the erection of a generating station to supply all the mines in the Rand district. It is probable that a company will shortly be registered with a capital of £1,750,000 in £1 shares, including £500,000 deferred shares. The name of Mr. W. A. Harper is mentioned in connection with the scheme as consulting engineer.

STRETFORD: *Electricity Accounts.*—In a statement of assets and liabilities lately presented to the Council, it is shown that the total amount expended upon the electricity undertaking now amounts to £63,818, whilst the amount sanctioned by the Local Government Board is £93,969.

TURTON: *Electric Lighting.*—An application is to be made to the Board of Trade for an Electric Lighting Provisional Order for the Urban District Council.

WALSALL: *Anti-Vibration Foundations.*—The electrical engineer having reported that the trial set of anti-vibration foundations on Prache's patent system had been perfectly satisfactory, the Electricity Committee has given instructions to have the second transformer equipped with a similar foundation at a cost not exceeding £50.

WEST HAM: *Electricity Accounts.*—As compared with the year ended March 31st, 1907, which resulted in a deficit of £1,829, the revenue of the West Ham electricity department for the year ended March 31st, 1908, amounted to £63,069, against £53,324—an increase of £9,745. Working expenses amounted to £39,326, an increase of £7,372, and capital charges to £28,044, an increase of £4,470, to which has to be added the cost of changing a single-phase generator to two-phase, making a total increased expenditure of £12,586. Adding last year's deficiency of £1,829, there is a deficit for the year ended March, 1908, of £4,670. As an explanation of, at any rate, a portion of this deficit, it is pointed out that the cost of changing over the single-phase generator to two-phase has been charged in the one year, although the benefit of the change will be felt for many years to come, whilst in addition there is a sum of £185 paid for water rights in connection with Abbey Mills Generating Station, which was scrapped in 1904. Other items which do not ordinarily occur as charges upon revenue are as follow :—Deductions from sanction of loan made by the Local Government Board in connection with installation of chain-grate stokers (£200); cost of public arc lighting in Hermit Road, &c., not covered by loan (£181); stores buildings, 84 Romford Road, charged against the year's revenue account (£250); increasing capacity of battery booster and coal storage (£180); breakdown of machinery at a large consumer's premises (£500). These special items total £2,240 out of the deficit of £4,670. The remainder is partly due to capital charges upon works which are not yet fully remunerative, and to the cost of internal reorganisation of the various departments. The cost of generation (£23,454) is an increase of £3,659, and of this coal represents £2,145, due to the increased output from the station and partly to increased coal prices. The coal cost per unit generated was 0·271d. against 0·345d. for the previous year, and compares with 0·218d. for April–August of the current year. So complete has been the reorganisation of the undertaking since Mr. Seabrook took charge of it two years ago, necessitating such heavy capital expenditure, that he considers a start was only made on a completely reorganised basis from March 31st, 1908. There appears, however, to be very little exceptional expenditure on revenue account ahead now. Only a small capital expenditure on mains is necessary for the current year, all the power districts now being supplied with two-phase current; the main increase is in normal connecting-up of consumers. Another main feeder for Silvertown and Stratford may be required next year, for which excavation and ducts were provided for in the last extension. At the generating station additional plant will be required to be put in from time to time, for which buildings and foundations already exist, the expenditure for the current year amounting to about £10,000 (payments due at March, 1909) for 3,000 kilowatts increase in capacity. For the first five months of the current year there has been an increased income for the whole undertaking of £6,052 over the corresponding period of the previous year at an increased total cost, including capital charges, of £1,731. The number of units sold during the year was 11,299,783, made up as follows :—Private lighting, 2,123,336; private power and heating, 4,161,156; public lighting, 790,180; tramways, 4,225,111. The maximum demand was 5,500 kw.

Appointment of Electrical Expert.—As the outcome of the recent Local Government Board inquiry, which was adjourned by the inspector on the representatives of West Ham refusing to disclose the prices at which they supplied certain power-consumers with current, the Town Clerk and Electrical Engineer reported to the Electric Lighting and Tramways Committee that they approached Mr. Merz, electrical expert, with a view of securing his services, but being connected with the London Power Promotions in opposition to the Corporation he was unable to accept. Mr. Arthur Wright, consulting engineer to the Corporation of Brighton, Marylebone, &c., has been appointed. Mr. Wright, who has already commenced his investigations, is to receive a fee of 100 guineas, *plus* 25 guineas for each day's attendance at the adjourned inquiry.

WORCESTER: *Powick Generating Station.*—The old plant at the Powick generating station has been sold to Messrs. Thomas Ward & Co., of Sheffield, for £850. This is less than the Electricity Committee originally hoped to get, but the price has been largely influenced by the drop in the price of copper. The deficiency upon the plant amounts to £800, but it will be met out of revenue during the next three years.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BRAZIL.—The *Diario Official* of September 11th contains a copy of a Decree approving plants presented by Messrs. Guinle & Co. for a hydro-electric power transmission line for the purpose of conveying energy from the hydro-electric works in the river Itapahau at Santos, State of Sao Paulo.

COVENTRY.—The Local Government Board's sanction has been received to the borrowing of the following sums :—Mains, £23,823, repayable in 25 years; transformers and services, £8,600, repayable in 50 years; meters, £500, repayable in 5 years; motors, £2,000, repayable in 10 years.

PENDLETON.—We announced in our issue for September 24th that Messrs. A. Knowles & Son, Ltd., were contemplating putting down electrical machinery at certain of their collieries. Messrs. Knowles ask us to state that this information is not quite correct, as no immediate steps of this character are contemplated.

PORTSMOUTH.- Tenders are invited for the reconstruction of a turbo-generator. Particulars from the Engineer, and tenders by October 21st.

PORTUGAL.—The *Diario do Governo* of October 1st contains a copy of a Decree authorising the Sociedad Armazeno das Beiras of Gouveia, concessionaires for the supply of electric light in the town of Ceia, to appropriate water from the river Alva for the production of electric power. The *Diario*, which contains information as to the terms under which the concession is granted, may be seen at the Commercial Intelligence Branch of the Board of Trade.

SHEFFIELD.—Mr. H. Shelford Bidwell held a Local Government Board inquiry last week into an application by the Council for sanction to borrow £120,000 for the purpose of public improvements. Of this £11,000 is required for electrical purposes, but no formal opposition was offered to this by the ratepayers. Questions were asked, however, on behalf of the local electrical contractors, of Mr. S. E. Fedden, the City Electrical Engineer, with regard to the Corporation selling fittings and undertaking wiring work. A case is pending challenging the legality of this procedure on the part of the Corporation, but as it was not relevant to the present loan in any way, the Inspector listened to the arguments, and the matter dropped.

SALFORD.—Tenders are invited for cooling-towers, tanks, pumps, and pipe-work. (See an advertisement this week.)

STRAITS SETTLEMENTS.—The *Straits Budget* states that the Government have sanctioned the proposal of the Penang

Digitized by Google

Municipal Commissioners to raise a loan of 100,000 dollars for the extension of the electric lighting and the duplication of the electric generating plant in the Northern Settlement.

Miscellaneous

BRADLEY FOLD.—The Brynn Hall Colliery Co., a well-known Wigan colliery firm, will, it is understood, adopt electrical working in connection with the new collieries they propose sinking at Bradley Fold between Bolton and Radcliffe on the Earl of Wilton's estates.

CUBA.—According to the *Bulletin Commercial* (Brussels), the Belgian Legation at Havana has reported that the Havana Electric Railway Co. have recently been authorised to carry out a considerable extension of their lines in that town. Work, it is stated, will very shortly be commenced.

DUBLIN.—An application is to be made to the Local Government Board for sanction to a loan of £4,000, in connection with street lighting.

LEEDS.—The Street Lighting Committee invite tenders for the purchase of scrap copper and brass. Offers to the Town Clerk by 20th inst.

Tenders are invited for the erection of a transformer chamber in East Street, Leeds, for the electric light department. Particulars of Mr. H. Dickinson, manager, 1 Whitehall Road, Leeds, and tenders to the Town Clerk by the 17th inst.

LINCOLN.—A proposal is under consideration for the extension of the tramways to the east and western portions of the city, at an estimated cost of £24,000.

LONDON: *Hammersmith.*—The Electrical Engineer of the Borough Council, in accordance with a scheme previously approved by the Council, has suggested the conversion from gas to electricity of 100 lamps in 15 streets at a cost of £602, and the Electricity and Lighting Committee have agreed to same. The Electricity and Lighting Committee have also had under consideration the lighting of Fulham Palace Road, in view of the erection of standards to carry the overhead wires in connection with the Putney to Hammersmith tramways now being constructed.

SOUTHEND.—The Corporation invite tenders for the supply and delivery of three bogie tramcars. Particulars from the Electrical Engineer (fee, one guinea, returnable), and tenders to the Clerk by October 17th.

SPAIN.—The *Gacetas de Madrid* announces calls for tenders for working the telephone systems (*a*) of the town of Murcia, (*b*) of the town of San Sebastian, (*c*) of the town of Pontevedra, and (*d*) of the town of Sabadell.

WALTHAMSTOW.—Tenders are invited for the sole right of advertising upon the Council's tramways for alternative periods of three or five years. Particulars from the Tramway Manager (fee, one guinea, returnable), and tenders to the Clerk by the 23rd inst.

Tenders are invited for the supply of arc lamp carbons during the period ended March 31st, 1910. Particulars from the Electrical Engineer, and tenders to the Town Clerk by October 23rd.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—Alterations and additions, Mansfield House Men's Club, Barking Road, E. Builder, Frank Hamlett Cotswold, Barking Road, E.

Match factory, Stratford. Architect, F. G. Forge, 28 Martin's Lane, E.C.

New offices and store at Canning Town for City Glass Bottle Co., Ltd., St. John's Road.

Store at H. Tate & Sons' sugar refinery, Silvertown. Store and machine workshop at R. Moreland & Son's premises, Bradfield Road.

S.E.—Charlton Congregational Church, Bramshott Avenue, Greenwich. Builder, George Parker, 124 Sumner Road, Peckham.

S.W.—Seventy houses, Mandrake Road and Glenburnie Road, Wandsworth. Architect, W. C. Poole, 62 Belleville Road, Wandsworth Common, S.W.

Building on site of 7 Princes Street, Westminster. Architect, H. C. Clarke, 63 Bishopsgate Street Within, E.C.

Workshop for electrical engineer's works, at Ingate Place, Queen's Road, Battersea. Builders, Macey & Sons, Ltd., 24 Essex Street, Strand, W.C.

W.—Rebuilding of mansion in Tilney Street and Deanery Street (Park Lane). Builders, T. Rider & Son, 181 Union Street, Southwark, S.E.

Alteration of Shaftesbury Theatre, Shaftesbury Avenue, into music hall. Walter Gibbons, Adelphi Terrace House, W.C.

Formation of new street on the Old Oak Lodge Estate, Hammersmith. Contractor, Mr. J. Allen, 111 Adelaide Road, Shepherd's Bush.

W.C.—Alterations to 448 Strand (late post office) for branch of London & South-Western Bank, 170 Fenchurch Street, E.C.

Re-erection of 5, 6, and 7 Spur Street, Leicester Square. Surveyors, Taperell & Haase, 9 John Street, Adelphi, W.C.

PROVINCES.

BELFAST.—New abattoir (£32,118). H. A. Cutler, Engineer and Surveyor, City Council.

BRISTOL.—Alterations and additions to brewery, Bath Street and Tucker Street. Architects, G. Adlam & Sons, Elbroad Street, Bristol.

BURTON-UPON-TRENT.—New police station, superintendent's house, and court-house. Builder, Richard Kershaw, Princess Street.

BURY.—Elementary school at Elton. A. W. Bradley, Surveyor and Engineer, Town Council, Bury.

CARDIFF.—Congregational Church, Penwain Road. Architects, Habershon, Fawckner & Co., 14 Pearl Street, Roath.

Alterations to Cardiff Exchange, Mount Stuart Square.

CHESTER.—Council school (£9,356). I. Matthews Jones, Surveyor, Town Council, Chester.

DEVONPORT.—School. Architects, Thornley & Rooke, 29 St. Aubyn Street, Devonport.

ELLAND (Halifax).—Secondary school. Architect, Henry Thompson, Southgate.

GOSPORT (Hants).—Portion of new school (accommodation for 440 scholars). H. Frost, Surveyor, Gosport and Alverstoke Urban District Council.

LEEDS.—Alterations to Millgarth Street Police Station. R. E. Fox, Town Clerk, Leeds.

Proposed extension of library accommodation at Woodhouse. W. T. Lancashire, City Engineer and Surveyor.

PETERBOROUGH.—School at West Town (£2,400). John William Walshaw, Surveyor, City Corporation.

SEAHAM (Durham).—Seamen's Mission, Seaham Harbour (£1,300). W. Cordner Scott, hon. sec.

SHANKLIN (I. of W.).—Proposed Kursaal (8,000). Architects, F. Matcham & Co., 9 Warwick Court, Holborn, W.C.

SHREWSBURY.—Elementary schools at Coleham. Architects, A. B. & W. Scott Deakin, 12A Pride Hill, Shrewsbury.

SUNDERLAND.—Children's Hospital, Durham Road. Ald. S. Richardson, J.P., Chairman of Infirmary Committee.

WALSALL.—Adaptation of Bloxwich Music Hall, for accommodation for Corporation administrative work. John Taylor, Borough Surveyor.

Cloak room, &c., Grand Theatre, Park Street, for the Walsall Theatres Co., Ltd.

WATFORD.—Manual instruction centre and cycle-shed at Victoria School (£764). County Surveyor, Herts County Council.

Drill Hall for Herts Territorial Force. Colonel C. E. Longmore.

WOLVERHAMPTON.—Factory and out-buildings in Penn Street for Southen Bros.

TENDERS RECEIVED AND ACCEPTED

ARGENTINE.—Nine tenders were received in connection with the erection of a generating station by the Cordoba Municipality. The power-house will contain two 500 kw. sets. The tenders were:—Ludke, Sajoux & Cia., $102,650; Hopkins & Cardom, $96,690; Cia Industrial de Electricidad del Rio de la Plata, $93,360; Agar, Cross, & Cia., $86,600; Colson, Brookhouse & Pyne, $82,541; G. Scherb & Cia., $81,470; Lindenberg, Nellen & Cia., $79,560; Parcus & Cia., $79,400; Bianchetti Hnos, $77,000.

BATH.—The tenders of Messrs. Babcock & Wilcox, Ltd., for a boiler at £2,150, and of Messrs. Stothert & Pitt for a water-tank at £145 for the electricity works, have been accepted.

BELFAST.—The tender of Messrs. Gregg, Son & Phœnix, Ltd., for the supply of cast-iron frames and covers for the electricity department has been accepted.

BOLTON.—The tender of the British Insulated & Helsby Cables, Ltd., for the purchase of scrap copper has been accepted by the Electricity Committee.

BRADFORD.—The tender of Messrs. J. W. Singer & Sons, Ltd., for special electric light fittings for the Town Hall has been accepted at £1,749.

DAWLEY.—Kynoch, Ltd., have secured a contract for the supply of a pumping plant to the Dawley District Council. The plant consists of two sets of Kynoch gas engines and suction gas plants, and Mather & Platt turbine pumps. The consulting engineers for the work are Messrs. Willcox & Raikes, of Birmingham and London.

GLOUCESTER.—The tender of Messrs. Moy, Ltd., for slack coal at 11s. 9d. per ton has been accepted in connection with the electrical undertaking.

Digitized by Google

The following tenders have been accepted for the supply of coal:—Mr. Alexander Crane, Princess Royal steam, 11s. 6d.; Lydbrook, 10s. 9d.; and Speech House, 9s. 9d. per ton; the New Bowson Coal Co., Lightmoor Colliery rough small, 7s. 8d. per ton.

INDIA.—The Empire Roller Bearings Company, Ltd., have received an order for 1,216 wheels and roller bearings complete for India, and amongst other contracts they have recently secured orders for roller bearings for the Ordnance Department and the Admiralty.

LONDON: *London County Council.*—The following tenders have been received:—

Slot rails and conductor rails.

P. & W. MacLellan, Ltd. (made by the North-Eastern Steel Co., Middlesbrough) (recommended), £15,193; Frodingham Iron & Steel Co., Ltd., £15,611; Walter Scott, Ltd., £16,559; Edward Le Bas (made by Ougrée Marihaye Steel Co., Belgium) (for short rails only), £12,197; Société Anonyme des Aciéries d'Angleur (for short rails only), £12,300.

Track rails and fastenings.

Société Anonyme des Aciéries d'Angleur, £21,439; Edward Le Bas, London (made by Ougrée Marihaye Steel Co., Belgium), £22,080; Walter Scott, Ltd., Leeds, £24,263; Bolckow, Vaughan & Co., Ltd. (recommended), £24,453. The chief engineer's estimates, comparable with the above tenders, are £15,857 and £24,773 respectively.

For the supply and erection of overhead travelling hand crane for the Camden Town tramways sub-station, the following tenders have been received:—John Smith (Keighley), Ltd. (accepted), £190; James Spencer & Co., £190; Alexander Jack & Co., £199; James Carrick & Sons, Ltd., £208; Marshall, Fleming & Co., £219; Applebys, Ltd., £264; John Williams & Sons (Cardiff), Ltd., £270; Rowland Priest, £275; Willcocks & Son, £295.

London County Council.—The tender of Elliott's Moulding & Joinery Co. for a tramway shelter at the Blackfriars terminus of the Embankment tramway, in oak, at £185, has been accepted.

The following tenders have been received for six electric stores transport vehicles, for use on the Council's tramways:—Mountain & Gibson, Ltd., £3,230 (accepted); Dick, Kerr & Co., Ltd., £3,230; United Electric Car Co., Ltd., £3,414; Hurst, Nelson & Co., Ltd., £3,439; Gloucester Railway Carriage & Wagon Co., Ltd., £3,774.

The following tenders have been received for three lifts at the central car repair depôt, two electrical, and one to be worked by hand: Medways Safety Lift & Elevator Co. (accepted), £603; Eastern Lift Co., Westminster, £882; Messrs. Archibald Smith and Stevens, Battersea, £920; E. Waygood & Co., Ltd., London, £923; A. W. Penrose & Co., Farringdon Road, £1,084.

For the supply of indicator box fittings for electric cars, the following tenders have been received: Hurst, Nelson & Co., Ltd., Birmingham (accepted), £150; Hoskins & Sewell, Ltd., Birmingham, £157 10s., less 2½ per cent.; Player & Mitchell, Birmingham, £160 8s. 8d., less 2½ per cent.; United Electric Car Co., Ltd., Preston, £567 11s. 4d.; Howarth & Houson, Birmingham (tender not to specification), £70. less 5 per cent.

London County Council.—Tenders have been invited from selected firms, for the work of substituting electric arc lamps for the existing gas lamps on Westminster Bridge—G. E. Taylor and Co. (accepted), £331; Foote & Milne, Ltd., 362; W. T. Henley's Telegraph Works Company, Ltd., £535; W. T. Glover & Co., Ltd., £587; Callender's Cable & Construction Co., Ltd., £591.

Chelsea.—The Borough Council has accepted the quotation of Wright Bros. & Co., for the supply and fixing of 87 electric light fittings for the Town Hall extension at £124. The acceptance is subject to the approval of the L.C.C. as regards the manner of suspending the fittings in the licensed portion of the building.

NELSON.—The tender of Messrs. L. Fryar & Co., of Nelson, for supplying and fixing screens for electric fans in the market hall has been accepted.

Manchester Engineers' Association.—The opening meeting for the session of this Association took place on Saturday, at the Grand Hotel, Manchester, when Mr. G. Hughes, of the Lancashire & Yorkshire Railway Co., took the chair. A discussion took place on the various engineering and electrical exhibits at the Manchester Electrical Exhibition, among the speakers being Mr. S. L. Pearce, the Manchester City Electrical Engineer.

Telegraph Traffic.—This week there are only two repairs of submarine cables to notify—namely, those between Sitia and Rhodes, and between Cape Haiti and Mole St. Nicholas on the north coast of the island of Haiti in the West Indies. The first repair was made on the 6th inst., while the other cable was put through on the 8th inst., having been down since September 13th last. Telegraph communication between Saigon and Pattambourg was interrupted on the 13th inst., and traffic is being forwarded "via Obone." There is still no alteration in the telegraphic situation at Venezuela. British Honduras is negotiating with Mexico for a telegraph line to connect it to the Mexican system.

COMPANIES' MEETINGS AND REPORTS

DEVONPORT & DISTRICT TRAMWAYS CO.—The accounts for the year to June 30th show a surplus of £580 after deducting debenture and other interest. The total amount available, including the sum brought forward, is £736, which the directors propose to carry forward. It is also recommended that £5,000 from the depreciation reserve fund be transferred to permanent-way renewals.

ROSARIO ELECTRIC CO.—The report for the year to June 30th shows a profit of £23,000, after meeting depreciation and expenses of issuing new capital, in addition to £4,600 brought forward. A dividend of 5s. per share is recommended upon the ordinary shares, making 8 per cent. for the year; a dividend of 8 per cent. on the second preference shares which have been converted into ordinary shares, and an additional dividend on other second preference shares which have been converted into ordinary shares. It is further proposed to allocate £600 as additional remuneration to the directors, and to add £5,000 to the reserve, carrying forward £6,549.

THE VICTORIA FALLS POWER CO., LTD.—The report of the directors from the incorporation of the company (October 17th, 1906), to December 31st, 1907, states that a profit and loss account has not been included because the year 1907, and also the current year, are, and will be, occupied by the work of construction, during which interest on the preference shares issued in December, 1906, is paid by the British South Africa Company. A revenue and expenditure account is included in the balance sheet, and £56,685, being the surplus of revenue over expenditure, is carried forward to the current year. The issued share capital of the company is £1,808,000, divided into 1,000,000 ordinary shares of £1 each, which have been issued fully paid, and 808,000 fully paid preference shares of £1 each. £800,000 debentures have also been issued. The assets acquired by the purchase of the Rand Central Electric Works included a 3,550 h.p. steam-driven station situated at Brakpan, which was in good working order, has run satisfactorily, and has earned good profits. It is intended, when the new stations now being erected by the company have been completed, to utilise this plant as a reserve. The assets of the Rand Central Electric Works, Ltd., also included the concession from the Government to supply electric power to the mines along the Witwatersrand. The president, vice-president, Sir Charles Metcalfe, and Mr. Henry Birchenough, directors of the company, visited the Rand during the summer of 1907, accompanied by Mr. Ralph D. Mershon and Mr. Arthur Wright, the Electrical Engineers of the company, and Mr. Bertram Fox on behalf of the Engineers-in-Chief. The directors and engineers also visited the Victoria Falls, and inspected the sites for the future water power stations and canal. The supply of the Witwatersrand market continues to be the first object of the company. The selection of the best positions for the erection of the company's new works on the Witwatersrand has therefore been a question of very great importance, and was one of the principal matters dealt with during the visit of the directors and engineers to South Africa. After full investigation of the local conditions, and having in view the above-mentioned facilities at Brakpan, it was decided to erect a new 8,000 h.p. station at Brakpan, and a second station of 16,000 h.p. capacity at the Simmer Pan, near Germiston, where an excellent freehold site has been purchased, and the required facilities have been granted by the Government. The power station at Brakpan is completed and the machinery is now running. The construction of the power-house building at Simmer Pan is rapidly progressing, and some of the machinery has been delivered. This station will be complete during the early part of next year. The new transmission lines along the reef are complete, and an extension to the west of Johannesburg is in hand. The company has entered into a number of important contracts for the supply of power to mines. The Germiston and Boksburg municipalities take the whole of their requirements from this company. Major the Hon. Walter L. Bagot, D.S.O., has been appointed General Manager of the Company in South Africa. Mr. Arthur E. Hadley, who has throughout been the alternate director for Herr Geheimrath Rathenau, has been elected a director. Mr. Hadley retires in accordance with the provisions of the Articles of Association, and, being eligible, offers himself for re-election. The meeting is on the 23rd inst. at Salisbury House, London Wall.

Electrical Standardising, Testing, and Training Institution.—The following arrangements for special lectures to be delivered during the Michaelmas Term have been made by the Governors of Faraday House:—"Generator Design," by Mr. H. M. Hobart; "Electrical Measurements," by Mr. J. Rennie, of the Board of Trade Electrical Standards Laboratory; "Fuel Economy," by Mr. J. B. C. Kershaw.

Rugby Engineering Society.—The first meeting of the Rugby Engineering Society for this session will be held in the large assembly room at the Penn Buildings to-night at 8 p.m., when the Presidential Address will be delivered by Mr. A. F. Bennett. The programme for the 1908-9 session includes the following Papers:—"Incandescent Electric Lamps," by F. Findlay; "The Exhaust Steam Turbine," by R. F. Halliwell; "Electric Railways," by F. W. Carter; "The Propulsion of Ships," by G. M. Brown.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f., quoted on Tuesday night, was £62 to £62 10s. per ton (last week, £61 15s. to £62 5s.).

GENERAL ELECTRIC BIRMINGHAM BRANCH.—The Birmingham house of the General Electric Co. is now situate at 42 High Street, and extensive showrooms, containing all the latest designs in electrical fittings, heating and cooking apparatus, fans, plain and fancy lamps, glass and silk shades, &c., have been opened.

HUDSON & BOWRING LIFEGUARDS.—In connection with the tramcar fender and wheel-guard tests inaugurated by the Public Service Commission of the first district, New York, a representative of the firm of Messrs. Hudson & Bowring, Ltd., of Manchester, paid a special visit to the United States, and submitted a guard. The tests, which took place at Schenectady, resulted in a very high percentage of marks being awarded to this guard, in one case 3·75 out of a possible 4.

SCHIFF & CO.—This firm will in future be known as "Ship Carbons, Ltd." 67 Aldersgate Street, London, E.C.

TANTALUM LAMPS.—Messrs. Siemens Brothers Dynamo Works, Ltd., of 6 Bath Street, City Road, E.C., express their regret at any slight delay which may occur in the delivery of their new "Tantalum" lamp showcards. Although a very large number of these were printed, the demand has far exceeded all expectations. A reprint is now in active course of preparation, and all applications for showcards will be filled at the earliest possible date.

VISIT TO MANCHESTER EXHIBITION.—On Saturday a party of upwards of 50 foremen of Messrs. Siemens Bros. Dynamo Works, Ltd., Stafford, accompanied by some of the officials, made an excursion to Manchester to visit the Electrical Exhibition. The members of Siemens' Stafford Engineering Society will visit the Exhibition on October 17th.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The public examination took place last week at Bradford County Court of Mr. W. T. Garnett, of Bradford, formerly carrying on the business of electric cable and wiring manufacturer, at Barker End Mills, Bradford, as W. T. Garnett's Cable Co. The debtor estimated his gross liabilities at £94.942, of which £31,329 was expected to rank for dividend. His assets, less preferential claims of £257, he estimated, would produce £8.129, leaving a deficiency of £23.200. The debtor attributed his failure largely to the fall in the price of copper during the past twelve months. The examination was closed.

A meeting of the Singapore Tramways, Ltd., will be held at 19 St. Swithin's Lane, London, on November 10th, at 12 noon, for the purpose of hearing the liquidator's account of the winding up.

MISCELLANEOUS CITY NOTES

CALCUTTA TRAMWAYS CO.—An interim dividend is announced upon the ordinary shares at the rate of 4 per cent. per annum for the half-year to June 30th.

CALLENDERS CABLE & CONSTRUCTION CO.—An interim dividend of 5s. per share (10 per cent. per annum) has been declared.

DIRECT UNITED STATES CABLE CO.—An interim dividend of 4s. per share, free of tax, has been declared for the quarter ended September 30th.

INDO-EUROPEAN TELEGRAPH CO.—An interim dividend for the half-year ended June 30th, at the rate of 5 per cent. per annum, has been declared.

MELBOURNE TRAMWAY & OMNIBUS CO.—The report for the year to June 30th shows a balance of £51.507, including £25.991 brought forward, after paying £72.C00 in dividend for the year in question. From the balance, it is proposed to pay a bonus of 6d. per share, and to give a bonus of 10 per cent. on their salaries to the staff, carrying forward £25.079. The number of passengers carried was 5.000,000 more than in the previous year.

MEXICAN LIGHT & POWER CO.—A dividend of 3½ per cent. has been declared upon the preference shares.

PRIMITIVA GAS & ELECTRIC LIGHT CO. OF BUENOS AIRES.—An interim dividend at the rate of 2s. 6d. per share is announced upon the ordinary shares.

STOTHERT & PITT.—A dividend of 10 per cent. free of income tax is recommended upon the ordinary shares for the past year, carrying £5.C01 to reserve, and £1.022 forward.

Glasgow Local Section I.E.E.—The meetings of the Glasgow Local Section of the Institution of Electrical Engineers, of which Mr. W. W. Lackie is chairman for the ensuing session, will again be held in the Lecture Hall, 207 Path Street. The opening meeting is on November 10th, and several important and interesting papers have been promised during the session. The seventh annual dinner will be held at the Grosvenor on November 17th, and the annual smoking concert at the same place on February 6th.

APPOINTMENTS AND PERSONAL NOTES

In accordance with the expressed desire of the Barking Electricity Committee, Mr. H. L. Howard, the Electrical Engineer, has withdrawn his resignation.

At the meeting of the Coventry City Council last week, the resignation of Mr. J. A. Jeckell, Electrical Engineer and Manager, was accepted, and the appointment of a successor at a salary of £450 per annum was recommended. A letter from Mr. Jeckell asking for his resignation to be withdrawn, and inviting a full investigation into certain coal contracts, was read, and an amendment that the matter should be referred back was defeated.

Mr. W. R. Poole has been appointed to the position of assistant to the Derby Electric Lighting Committee in place of Mr. C. A. H. Hughes, who has resigned .

Mr. H. Bell, one of the engineers-in-charge at the Hammersmith electricity works, has resigned.

Two hundred and seventy-five applications were received by Hammersmith Borough Council in connection with the appointment of two junior engineers. The commencing salary is £135, rising £5 annually to £150, and the positions have been secured by Mr. W. A. Kitchen, Hatch End, and Mr. C. H. Thorpe, Hither Green.

Mr. W. G. Tillott, mains superintendent at Hammersmith, has resigned his position on account of ill-health, and is going to New Zealand. Mr. Tillott was in the service of the Hammersmith Electricity Department for eleven years. Mr. H. S. Taylor, mains assistant, has been appointed to the vacancy at a salary of £140, rising by £5 per annum to a maximum of £150 per annum.

By a printer's error in our last issue, the name of Mr. Neachell, who has been appointed General Manager of the Liverpool Overhead Railway, in succession to Mr. S. B. Cottrell, was given as "Meachell."

Mr. M. P. Ford has resigned his position as Managing Director of the Brooke Tool Manufacturing Co., and is now with Mr. S. N. Brayshaw, of Manchester.

NEW COMPANIES

PENRITH ELECTRIC SUPPLY CO.—This company was registered on October 5th with a capital of £7,000 in £1 shares (3,500 5½ per cent. cumulative preference), to acquire the benefit of the Penrith Electric Lighting Order, 1900, to adopt an agreement with the Penrith Urban District Council, and to carry on the business of an electric light and power supply company. The subscribers are:—W. P. Theermann, 263 Oxford Road, Manchester, electrical engineer; H. Fox, 44 Windsor Road, Doncaster, electrical engineer; J. W. Speight, The Elms, St. Anne's-on-the-Sea, consulting engineer; P. H. Whitaker, 46 Abingdon Street, Blackpool, engineer; H. L. J. Butler, 2 Castlegate, Penrith, electrical engineer; W. A. Turner, 2 Castlegate, Penrith; P. Fox, 12 Wrayfield Avenue, Shipley. Minimum cash subscription, 25 per cent. of the shares offered to the public. The number of directors is not to be less than three nor more than seven; the first are W. P. Theermann, H. Fox, and J. W. Speight. Qualification, 200 ordinary shares. Registered office, 3 Castlegate, Penrith, Cumberland.

PRIVATE TELEPHONE CO.—This company was registered on October 8th with a capital of £1.000 in £1 shares, to acquire the business of a company of the same name (incorporated in April, 1908, and now in voluntary liquidation), and to carry on the business of electricians, electrical engineers, manufacturers of and dealers in electrical apparatus, &c. The subscribers are:—M. Atkinson, Oakfield, Highgate Avenue, N., engineer; Miss F. E. Pittard, 148 St. John's Road, S.E., secretary. Private company. The number of directors is not to be more than three. M. Atkinson is the first director, and may retain office while holding 100 shares. Registered office, 27 Chancery Lane, W.C.

SHIP CARBONS.—This company was registered on October 7th with a capital of £1,000 in £1 shares, to sell in the United Kingdom (and not elsewhere) carbons, incandescent lamps, and other electro-technical articles, &c. The subscribers are:—M. P. Schiff, partner of Schiff & Co., Schechat, Austria; J. P. Schiff, 200 Alleegasse, Vienna; E. Ornstein, Schwechat, Austria; A. Merle, Schwechat, Austria; Dr. O. Thorsch, Vienna, Imperial Councillor; R. Guth, Hybernergasse 20, Prague; Dr. H. Singer, Vienna. The number of directors is not to be more than three. The directors are given the customary powers of borrowing on debentures or other security, or without security. Registered office, 67 Aldersgate Street, E.C.

Manchester Local Section, I.E.E.—The opening meeting of the Manchester Section of Electrical Engineers takes place on Friday, October 23rd, at the Midland Hotel, Manchester, at 7.30 p.m., when the chairman, Mr. Miles Walker, will deliver his address. The remaining meetings of the session will be held in the Physical Laboratory of the Manchester University. The opening meeting of the Manchester Students' Section will take place at the Grand Hotel at 7.30 p.m., on Tuesday, October 27th, with a supper and smoking concert.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 8th, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

1907 Patents

13,724. **Electric Power Transmission Gear for Ship Propulsion, &c.** H. A. Mavor and Mavor & Coulson, Ltd. This apparatus is virtually an electrical variable-speed gear, as is suitable for the propulsion of ships by high-speed steam turbines and low-speed propellers, and similar purposes. The shaft to be driven is connected to an element common to a multiphase generator, the field magnet of which is driven by the prime mover, and a multiphase induction motor, the stator of which surrounds the combination. Arrangements are made that this member can be subjected to the reaction torque of the generator, either alone or augmented, diminished or overcome by the torque due to the motor as required, by varying the slip between the stator and rotor field of the motor, the direction of the current and the number of effective poles. The arrangement can be adopted to produce current for external purposes also. (Two claims, one figure.)

21,073. **Alternator Armature Windings.** Siemens Brothers' Dynamo Works, Ltd. and M. Kloss. In a spiral winding for alternator armatures the necessity for open slots is avoided, and the use of semi-closed slots rendered possible by arranging the former wound coils in such a way that each coil limb fills only half a slot, and that the pitch of two adjacent coils belonging to the same group or pole differs by the tooth pitch only. (One claim, two figures.)

21,651. **Avoidance of Interference in Wireless Telegraphy.** Marconi's Wireless Telegraph Co., Ltd. and A. M. Young. Extraneous signals which cannot be tuned out by ordinary methods, are eliminated by the employment of two receiving transformers. The primary of one is in a circuit in resonance with the wave length of the desired signals, and the primary of the other is in a circuit in resonance with the wave length of the objectionable signal. The secondaries are connected to a telephone or other receiving instrument in such a manner that the difference between the strength of the signals from them actuates the instrument. Means of adjusting are provided for equalising the strength of the objectionable signals, and thus eliminating them. (Two claims, two figures.)

23,915. **Automatic Motor Starters.** British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*). This improved automatic motor-starting system, of the class in which the resistance steps are controlled by contactors operating successively as the counter electromotive force of the motor rises, is made more particularly suitable for circuits where there are large variations of voltage, which might result in an excessive use of pressure being applied to the motor on the last step by the addition of a relay only allowing the contactors to operate when the drop of pressure across the whole resistance, or the last section thereof does not exceed a predetermined value. (Two claims, two figures.)

25,772. **Control of Traction Motors.** W. A. Stevens. In order to ensure that two motors in petrol-electric, or electric cars shall take approximately the same current when in parallel, and to prevent one machine running as a dynamo and the other as a motor, an additional field coil is added in series with each motor armature, which tends to strengthen the main field, when the armature is running as a motor, but acts differentially when the armature tends to run as a generator, weakening the field, and thus creating a balance so that the two run in parallel as motors, taking the same amount of current. (Two claims, one figure.)

26,399. **Compound Tramway Rail.** J. S. Pullan. The girder portion and the flange form one piece. The replaceable tread is dove-tailed into an undercut longitudinal groove, and secured by taper keys for the insertion of which suitable spaces are left at intervals. (Two claims, one figure.)

1908 Patents

2,046. **Prevention of Rolling of Ships.** H. A. Mavor and Mavor & Coulson, Ltd. In this method of damping the rolling of ships a movable weight is employed, which tends to remain stationary as the ship rolls, and offers resistance to the rolling movement. The weight can be in the form of a carriage on a track transverse to the ship, the motion of which is damped by an electro-magnetic brake. (Three claims, two figures.)

7,493. **Telephones.** R. A. Tessenden. In these telephone transmitters and relays the varying microphone resistance is produced by the displacement of a floating electrode, supported to dip into a quantity of granules of carbon instead of the latter being enclosed in a chamber with yielding walls. The connections can be made so that the two sections of granules on both sides of the floating electrode are included in the two arms of a differential circuit. In the relay the floating electrode is attached to the armature of a differential relay. (Seven claims, five figures.)

8,133. **Commutators for High Speed Machines.** Siemens Brothers' Dynamo Works, Ltd. and E. O. Kieffer. In the type of high-speed commutator built with external steel rings, the segments are secured by conical end rings, provided with slots so arranged as to provide a certain amount of spring. By this means they are enabled to take up slackness of segments produced subsequently to building up by unequal expansion or vibration, and prevent the commutator becoming loose. (Two claims, three figures.)

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

16,780, Metallurgiska Patent Aktiebolaget. Apparatus for magnetic separation of ore.
21,106, Eisenstein. System of multiplex telegraphy.
21,212, McKee. Meter connections.
21,271, Evershed & Vignoles, Ltd., & Evershed. Apparatus for measuring electrical resistance.
21,460, Siemens Bros. Dynamo Works, Ltd., Altmann, & Lau. Armature windings.
21,588, Von Zweigbergk. Electric controllers for railways.
22,700, Hirst & Maurice. Means for supporting electric lamps.
23,780, Lindsay & Lindsay. Reversible and collapsible trolley pole for electric vehicles.
23,816, Cummins. Means of controlling brake power on electrical tramway and railway vehicles.
23,857, Chapman. Means for attachment to the trolley boom of an electric tram for the purpose of guiding the trolley wheel to the live overhead wire.
25,355, Capitaine. Electric arc lamps.
25,841, Crosta & Dilley. Brakes for road and tramway vehicles.
27,681, Jones. Electric resistances.
28,137, British Thomson-Houston Co. (*General Electric Co.*). Alternating-current induction motors.

1908 Patents

1,420, Chloride Electrical Storage Co. & Heap. Treatment of wood for use in batteries and electrolytic cells.
1,984, Electric Ignition Co. & Hall. Electric-ignition apparatus for internal-combustion engines.
2,480, Fried. Krupp Akt.-Ges. Electrically-driven elevating gear for ordnance.
3,634, Fried. Krupp Akt.-Ges. Electrically-driven elevating gear for barrel recoil ordnance.
5,160, Pieper. Electro-mechanical transmission systems for automobiles and the like.
6,149, Sykes. Electric switches.
6,412, Löwendahl. Electric sliding or other contacts.
7,747, Chambers Motors, Ltd., & Patton. High-tension magneto ignition apparatus for internal-combustion engines.
7,750, Ketchum. Electric locomotives.
9,697, Thames Iron Works Shipbuilding and Engineering Co., & Flood. Electric switches.
10,156, Erdmann. Apparatus for preventing collision between ships by means of electric waves.
10,172, Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*). Construction of telephone jacks.
12,050, Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckert-werke Ges.*). Electric fuses fitted with indicators.
12,927, Kavanagh. Tramcars or the like.
13,451, Siemens-Schuckertwerke Ges. Repulsion motors.
14,697, Siemens Bros. & Co. & Ferreira. Devices for indicating the position of railway points and the trains.
16,496, Fiddes & Seifke. Electric water-heaters.
16,900, Tayoux, Chauchy, & Fraysse. Magneto-electric machines.
18,222. Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckert-werke Ges.*). Fixing and supporting overhead electric traction conductors in tunnels and the like.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

18,372, Allgemeine Elektricitäts-Ges. Alternating-current dynamo-electric machines of the commutator type.
19,265, Marsh. Electric furnaces.
19,574, Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. Manufacture of insulating-tubes.

EXPERIENCE WITH ELECTRICALLY-DRIVEN ROLLING MILLS

NOT the least interesting of the Papers read at the Middlesbrough meeting of the Iron and Steel Institute was that by Mr. C. Koettgen, Managing Director, Siemens Brothers Dynamo Works, and Mr. C. A. Ablett, of the same firm. The authors at the outset emphasised the great facilities which the employment of electric power for rolling-mill driving offers for the exact measurement of the power required for different classes of work, and for accurate determinations to be made regarding the variation of the power required with different sections, temperatures, and materials. The Paper was accompanied by valuable tables giving results of this nature obtained in German practice. For example, bars 1·4 in. square can be rolled with an expenditure of energy of only 28·8 kw.-hours per ton, whereas tees 1·2 in. by 0·16 in. require as much as 136 kw.-hours per ton. From results such as these the average power required for a mill to perform given work can be estimated, and by making due allowance for the intermittent nature of the working. The rolling-mill motor, however, must be designed also with a view to the maximum power required, the proportion of which to the mean power will vary according to circumstances. In a three high mill, for instance, the motor must be so proportioned to meet the case of the heaviest passes occurring in each housing simultaneously. Again, the presence of a flywheel will reduce the maximum demand on the motor. A collection of curves are reproduced in the Paper to the magnitude of the variations in the load in a number of actual cases.

In order that the flywheel may equalise the fluctuations in the power, the motor and flywheel must fall in speed as the maximum power is required, to enable the flywheel to give up its stored energy, and the flywheel regains its stored energy again as it is speeded up in the interval between the passes. With a direct-current motor the necessary fall in speed can be obtained by using a compound-winding, but with a three-phase motor a resistance must be inserted in the rotor circuit, which increases the slip of the motor.

Curves are shown and explained for a case where the use of a flywheel reduced the maximum power which the motors were required to give from 1,980 h.p. to 1,200 h.p., while the maximum variation in speed was from about 7 per cent. There are cases, however, where heavy passes follow each other in too rapid succession for the flywheel to have time to recover its speed.

Where a three-phase motor is used, and the fall in speed is obtained by placing a slip resistance in the rotor circuit, a loss of power takes place in the slip resistance which is proportional to the slip required and to the power which the motor is giving. No such loss of power takes place in the case of a direct-current motor where the fall in speed is obtained by using a compound winding. In consequence of this, with a three-phase motor, a less fall in speed is usually allowable than is the case with a direct-current motor, and consequently a heavier flywheel has to be used to give out the same amount of energy.

An automatically-controlled slip resistance is sometimes used, arranged to be only fully in circuit when the motor current exceeds a certain predetermined limit, and is switched out again at lighter loads. There is not, however, the saving in efficiency which would appear at first sight, as the slip resistance remains connected in circuit during the periods of maximum load (when the power lost is also maximum), whether it is provided with an automatic arrangement or not, and it is only switched out of circuit during the periods of minimum load when the loss of power is comparatively small. There are, however, some cases where it is an advantage.

The replacement of steam by electrical driving has almost invariably been found to increase the output of the mill, and sometimes by as much as 50 per cent., mainly owing to the steadiness of the speed, which greatly facilitates handling of the material and the less reduction of speed on overloads, owing to the greater overload capacity of electric motors, and their power of responding more quickly than steam engines to sudden demands for power.

In dealing with matters of detail, the authors emphasised the desirability of using flexible couplings between the motor and the rolls, and described one or two suitable forms.

In the latter portion of the Paper figures and curves are given relating to power taken at each successive pass in reversing cogging mills, which are usually equipped on the Ilgner system. It is pointed out that the electrical equipment is working economically in the sense that the greatest output is obtained for a given capital outlay, if the draughts are taken so that the motor is giving constant torque at each pass, this torque being the maximum working torque of the motor. It must be remembered, however, that if the mill motor is giving constant torque during each pass, it will require much more energy during the last passes than during the earlier ones, as the ingot is becoming longer, and so takes longer to go through the rolls. It is therefore advisable to reduce the draught in the last few passes, the torque which the motor is required to give for these reduced draughts being correspondingly reduced, as otherwise the flywheel set will have to be unduly large.

ELECTROMETALLURGY

IN *Electrochemical and Metallurgical Industry* of October, Mr. L. Robert Whitehead concludes his description of the electrolytic refining of gold, silver, and copper at the United States works at San Francisco. An illustration is given of the melting room, which contains four melting furnaces holding from 80 to 100 graphite crucibles. The furnaces are heated by means of oil fuel, and differ from those of the Denver equipment in that they contain an open top with the circular combination chamber, the consumption of oil in this furnace being very low. With seven furnaces in operation working seven hours per day the total cost per month does not exceed 60 dollars, and this is remarkably low considering about 600,000 ounces are melted each month. He then gives a comparison of the methods used by the different mints. In San Francisco the Thum process with certain modifications is employed, for example, particularly in respect to the circulation of the electrolyte necessitating the employment of a larger quantity of solution, but it is more readily purified than in other processes. Other mints employ the Tuttle process, and in this process it is necessary to have a rolling mill for making the silver cathodes, which, in the bath are placed about three inches apart from the anode, each anode, however, being individually bagged. The anodes consist about one-third part of gold, and as the silver dissolves from them the gold remains intact, and therefore does not crumble away and press down in the bags.

In dealing with an outside plant it would probably be different, because very few plants employ metal containing as much as 50 parts per one thousand in gold. The gold would, therefore, fall off as slime and work through the bags, and another point is that the propeller system of circulation causes too much agitation in the baths. The deposited silver, however, is not actually coherent, because it trees very considerably, and therefore it is necessary to take out the cathodes and scrape them every day in order to prevent short circuiting. Another disadvantage is that about 10 per cent. of the deposit falls to the bottom of the tank. The chief drawback of the process from a commercial standpoint is the low current density required if a coherent deposit is to be obtained (7-8 amperes per square foot of cathode surface at the commencement, but later from 4-5 amperes). There is one advantage over the Thum process in that an E.M.F. of 1 volt is sufficient with this process, whereas the other requires 3½ volts. The addition of small quantities of gelatine improves the coherency of the deposit. In one of the mints the powdered silver which falls to the bottom of the bath is melted and refined by means of the Thum process, while in another it is used together with the daily scrappings from the cathode to make silver nitrate for replenishing the electrolyte. The anode residue of gold, which is, as already mentioned, solid, is of a chocolate colour, and generally has a silver core running through it, so that it has first to be parted in nitric acid, and finally in sulphuric acid. By this treatment it is got sufficiently low in silver to be refined by the Wohlwill process.

The author says that he is not surprised that the Wohlwill process has not been taken up commercially outside the mints because anyone going through the Government plants and seeing the large amount of gold which is tied up in the process concludes naturally that this is necessary. For example, the electrode bars are covered with strips of fine gold as also are the hangers. Large stocks of gold chloride are always kept on hand, and big reserves of anodes and cathodes. It would not pay industrially to keep such a large quantity of valuable material in stock, but the author says that the electrodes can be made of the same material. Cathodes of fine rolled silver can be used upon which to deposit the gold, which can afterwards be stripped off, which can easily be done, as the author has made experiments with proof gold, and found, after stripping, that the gold assayed 998·5, and the hangers and straps may be of fine silver.

By using a cathode with only one side exposed for deposition, 85 per cent. of the gold can be removed in 24 hours, and the remaining 15 per cent. in 48 hours. Consequently the gold con-

Digitized by Google

stantly tied up would be the amount in the electrolyte. When one considers that the Government refiners are saving yearly about 50,000 dollars' worth of platinum with very little expense, and for which nothing is paid, it would seem to be about time that industrial plants commenced to test this process commercially.

In *Stahl und Eisen*, 1908, Vol. 28, p. 1237, G. Hannack describes the best class of steel for magnets. In order to prepare steel for permanent magnets it is necessary that it should be hard, as it is found that with increase in hardness the adhesive power increases. After a certain grade of hardness, however, a maximum is reached; then further hardening causes it to decrease. According to Madame Sklodowska-Curie, the maximum carbon content of the steel must not be beyond 1·2 per cent. It is also necessary for the magnet steel to be fine grained, and this is caused by the addition of tungsten. If, however, too large a quantity of tungsten is added, the steel becomes less valuable for magnetic purposes. Manganese is said to be harmful, but the author finds that manganese does not particularly affect the power of being magnetised, but it decreases the permanency. For example, magnet steel with from 0·2 to 0·3 of manganese readily magnetises, but rapidly loses its magnetism. Small quantities of silicon are not objectionable. A specially good steel was found to consist of carbon 0·597 per cent., tungsten 5·369 per cent., manganese 0·176, phosphorus 0·018, sulphur 0·038, silicon 0·255, and copper 0·004. Any considerable quantity of sulphur, phosphorus, copper, or nickel, is objectionable. Molybdenum can be used, but it is expensive; also chromium behaves very much like tungsten, but titanium must not be employed.

NEW BOARD OF TRADE REGULATIONS FOR PRIVATE TRANSMISSION LINES

The Board of Trade have issued a revised set of regulations under section 4 of the Electric Lighting Act of 1888, which relates to the erection of overhead wires, &c., where the owners are not subject to the provisions of a licence, provisional order or special Act of Parliament. These regulations, of course, only apply in those cases where the safety of the public is involved, and have also been drafted to safeguard the telegraph and telephone systems of the country. In comparison with the old edition the scheme of the new regulations has been considerably altered both in the matter of arrangement and subject matter. For instance, a pressure exceeding 500 volts continuous, or 250 volts alternating, was formerly regarded as high pressure. It will also be seen that special sections are now devoted to "Sub-stations and Transformers," "Compulsory Connection of a three-wire System with Earth," and "Optional Connection of other Circuits with Earth," while sections on "Street Boxes" and "Arc Lamps" which appeared in the old regulations have been deleted.

We give the new regulations in full below:—

Definitions.

In the following regulations:—The expression "Energy" means electrical energy, and for the purpose of the Electric Lighting Act, 1888, and these regulations, electrical energy shall be deemed to be an agency within the meaning of the word "electricity" as defined in the Electric Lighting Act, 1882. The expression "Owner" means any body or person owning or using or entitled to use any electric lines or works, upon whom notice has been served by the Board of Trade requiring that such electric lines or works shall be continued and used only in accordance with these regulations. The expression "Consumer" means any body or person supplied with energy by the Owner. The expression "sub-station" means any premises in which energy is transformed or converted for the purpose of supply to consumers, and which are large enough to admit the entrance of a person after the transforming or converting apparatus is in position, provided that for the purpose of these Regulations any place within any such premises which is used solely for some purpose other than such transformation or conversion shall not be deemed to form part of a sub-station. The expression "Overhead line" means any electric line which is placed above ground and in the open air. The expression "Service line" means an electric line through which energy may be supplied or intended to be supplied by the Owner to any premises other than the premises where the energy is generated. The expression "Pressure" means the difference of electrical potential between any two conductors through which a supply of energy is given, or between any part of either conductor and the earth; and (*a*) Where the conditions of the supply are such that the pressure at any pair of consumer's terminals does not exceed 250 volts, the supply shall be deemed a low pressure supply. (*b*) Where the conditions of the supply are such that the pressure exceeds 250 volts but does not exceed 650 volts, the supply shall be deemed a medium pressure supply. Other expressions to which meanings are assigned in the Electric Lighting Acts, 1882 and 1888, have the same respective meanings in these regulations.

General.

1. Nothing in these regulations shall be deemed to authorise the owner to break up or interfere with any street.

2. When the pressure of the supply exceeds 250 volts, all wires, switches, and metal work in connection with the supply shall be so enclosed or shall be fixed in such a manner that there shall be no risk of any shock being obtained by inadvertence or in the ordinary handling thereof.

3. Where the pressure of the supply exceeds 650 volts, the supply shall be subject to such further regulations as the Board of Trade may make, or shall be given on such conditions as they may prescribe.

4. The insulation of every electric circuit (whether connected with earth in accordance with these regulations or not) including all machinery and apparatus, forming part of the maxinection with that circuit, shall be so maintained that the leakage current shall not exceed one-thousandth part of the maximum current; and suitable means shall be provided for the indication and localisation of leakage. Every leakage shall be remedied without delay. Every such circuit shall be periodically tested for insulation.

5. In the use or delivery of energy, the owner shall exercise all due precautions so as to avoid the risk of causing electric shock or fire, and shall be responsible for all electric lines, fittings, and apparatus belonging to him, or under his control, being maintained in a safe condition.

6. Any electric line or any support therefor exposed to liability to injury from lightning, shall be efficiently protected against such liability.

7. All mains below ground shall be so laid and protected as to avoid risk of damage by accumulation of gas or leakage of electric current.

8. Where any accident by explosion or fire, or any other accident of such kind as to have caused or to be likely to have caused loss of life or personal injury has occurred at any part of any electric line or other works, the owner shall give immediate notice thereof to the Board of Trade.

9. Every reasonable means shall be employed in the placing and use of electric lines to prevent injurious affection, whether by induction or otherwise, to any electric lines or other works of the Postmaster-General or the telegraphic communication through any such lines.

10. (*a*) The owner on receipt of these regulations shall forthwith serve upon the Postmaster-General a notice describing every electric line used for the supply of energy, together with a plan showing the mode and position in which such electric line is laid. (*b*) The Postmaster-General, upon consideration of such notice and plan, may require such alteration in the position and mode of laying, or mode of use of such electric line, or compliance with such other conditions as he may think necessary for the due protection of his electric lines or other works, and any failure on the part of the owner to comply with such requirements shall be deemed to be a non-compliance with these regulations. (*c*) Any notice required to be served upon the Postmaster-General under these regulations may be served by being addressed to him, and left at, or transmitted through the post to the General Post Office, London, and any notice required to be served on the owner may be served by being addressed to him and left at, or transmitted through the post to, his office or last known place or address.

Overhead Lines for Low-Pressure and Medium Pressure Continuous-Current Supply and for Low-Pressure Alternating-Current Supply.

11. All overhead lines shall be attached to insulators, and shall be so guarded that they cannot fall away from the support.

12. An overhead line shall not in any part thereof be at less height from the ground than 22 ft., except with the consent of the Board of Trade, and shall not be accessible to any person without the use of a ladder or other mechanical means.

13. Where an overhead line crosses a street, the angle between the line and the direction of the street at the place of crossing shall, where practicable, be 60° at least, and the spans shall be as short as possible.

14. Where an overhead line crosses, or is in proximity to, any wire or metal, precautions shall be taken by the owner against the possibility of the line coming into contact with the wire or

Digitized by Google

metal, or of the wire or metal coming into contact with the line by breakage or otherwise.

15. Every support for an overhead line shall be of a durable material, and shall be properly stayed against forces due to wind pressure, change of direction of the line, or unequal lengths of span.

16. The interval between any two wooden poles used singly as supports for an overhead line shall not exceed 200 ft. In the case of supports other than single wooden poles the intervals between the supports shall be such as may be prescribed by the Board of Trade.

17. The factor of safety shall be for overhead lines at least five, and for wooden poles at least 10, and for iron or steel structures at least six, taking the maximum possible wind pressure at 30 lb. per square foot. No addition need be made for a possible accumulation of snow.

18. Service lines from overhead lines shall be led as directly as possible to insulators firmly attached to some portion of the consumer's premises which is not accessible to any person without the use of a ladder or other special appliance. Every portion of any service line which is outside a building, and is within 7 ft. from the building, shall be efficiently protected by insulating material.

19. Every overhead line, including its supports and all the structural parts and electrical appliances and devices belonging to or connected with the line, shall be duly and efficiently supervised and maintained as regards both electrical and mechanical conditions.

20. Where a supply is given by overhead lines from a two-wire system, with the negative conductor connected with earth, the positive conductor shall be placed above the negative conductor in such a manner that in the event of breakage it must fall on the negative conductor.

21. Where a supply is given by overhead lines on the three-wire system, the positive and negative conductors shall be placed side by side above the intermediate conductor. The intermediate conductor shall consist of two wires placed side by side at a distance apart greater than that between the positive and negative conductors, and connected in each span by two cross wires, placed in such a manner that in the event of either the positive or negative conductor breaking it shall fall on one at least of the cross wires.

22. The owner shall remove any overhead line upon ceasing to use it for the supply of energy, unless upon so ceasing he satisfies the Board of Trade that he intends to bring it into use again within a reasonable time.

23. Overhead lines for pressures exceeding medium pressure continuous current or low pressure alternating current shall be subject to such futher regulations as the Board of Trade may make or such conditions as they may prescribe.

Sub-stations and Transformers.

24. Sub-stations shall be established in suitable places, and shall be in the sole occupation and charge of the owner, and subject to any requirements of the Home Office. Where transformers are used in any other premises (not being sub-stations as defined for the purposes of these regulations) they shall be so guarded and protected as to avoid the risk of causing electric shock.

Compulsory connection of a Three-wire System with Earth.

25. Where the pressure of a supply between the adjacent conductors of a three-wire system of mains exceeds 125 volts, the intermediate conductor shall be connected with earth, in accordance with the following conditions:—(*a*) The connection with earth of the intermediate conductor shall be made at one point only on each distinct circuit, namely, at the generating station, sub-station, or transformer, and the insulation of the circuit shall be efficiently maintained at all other parts. (*b*) The current from the intermediate conductor to earth shall be continuously recorded, and if it at any time exceed one-thousandth part of the maximum supply current, steps shall be immediately taken to improve the insulation of the system.

Optional connection of other Circuits with Earth.

26. The owner may, with the approval of the Board of Trade given with the concurrence of the Postmaster-General (but not otherwise), connect any other circuit with earth, provided the following conditions are complied with (namely):—

General.—The connection with earth shall be made only where energy is delivered to each circuit, that is to say, at a generating station, sub-station, or transformer, and shall be made at a neutral point in the circuit and in such a manner as will ensure at all times an immediate and safe discharge of energy. The connection with earth shall be efficiently maintained, except when it is interrupted by means of a switch or link for the purpose of periodical tests for ascertaining whether any current is passing by means of the connection to earth. The insulation of the mains shall be efficiently maintained at all other parts. Tests shall be periodically made to ascertain whether any current is passing by means of the connection to earth, and if at any time the current so passing exceeds one-thousandth part of the maximum supply current of the circuit, steps shall be immediately taken to improve the insulation.

Special.—1. Separate or three- or four-core mains used for alternating current where a low pressure supply is given between a phase and the neutral point, or where the pressure between any two conductors exceeds 250 volts. The connection with earth shall be made in the case of (*a*) a single-phase supply, at the neutral point on the winding of the transformer; (*b*) a two-phase three-wire supply, by means of the third wire; (*c*) a two-phase four-wire supply, at the neutral point on the winding; (*d*) a three-phase three-wire or four-wire supply, at the neutral point on the star winding. 2. Concentric mains used either for continuous or for alternating current. The connection with earth shall be made by means of the external conductor.

CATALOGUES AND PAMPHLETS RECEIVED

ADVERTISING SIGNS.—The General Electric Sign and Engineering Co., Ltd., of Cambridge Circus, W.C., have sent us a circular describing a neat form of thermal flasher for electric signs and convenient portable single light show card flasher for connecting by an adapter and flexible cord to an ordinary lamp-holder.

ALUMINIUM WIRE.—New leaflets recently issued by British Insulated & Helsby Cables, Ltd., give prices and particulars of aluminium wire and strip from their own rolling mills and wire drawing plant. Annealed aluminium wire has an electrical conductivity 60 per cent. of annealed copper (100 per cent. Matthison standard), and for the same resistance as copper the diameter is 1·29 times greater. The ultimate tensile strength varies from 10·8 to 15·2 tons per square inch, and the elastic limit is approximately three-quarters of this. Sizes are listed from Nos. 40 to 0000 S.W.G., and a list of some of the most important aluminium transmission lines is given. The firm have patented a special method for making welded aluminium joints. The principal feature in this method is a sleeve or trough made of a metal having a higher melting point than aluminium, preferably brass or copper. This sleeve is fixed over the butted ends of the wires or strips to be jointed, and acts both as a mould for the molten metal and as a centreing device for the two ends. Heat is applied to the outside of the sleeve until the wires inside become molten at their adjacent ends when longitudinal pressure is applied to the wires. By this means the oxidised metal is forced outwards, enabling clean metal to come in contact and form the joint. They have also designed and patented a hand welding tool for welding wires by the method described above. The tool is composed of two jaws or clamps to hold the wires, the jaws sliding on a central bar to which is attached a handle. Longitudinal pressure is automatically applied to one jaw by means of a compression spring. By means of this apparatus and one spirit blow lamp, aluminium wires from 0·250 in. diameter down to 0·020 in., or even smaller, can be readily welded.

CONTINUOUS CURRENT MOTORS.—A list is to hand from Messrs. Johnson & Phillips, giving prices for protected ventilated and enclosed type motors, either series, shunt, or compound wound, for 110, 220, and 440 volts, and also prices for the spare parts and armatures and shipping specification of each size of motor. Another list deals with the various materials required by electrical contractors and engineers who have to handle cables. Both lists are coded for the convenience of foreign firms.

DEMAND INDICATORS.—A leaflet from British Insulated & Helsby Cables, Ltd., describes the Fricker patent maximum demand indicator which they now manufacture. This instrument consists of a new and extremely simple form of recording differential thermometer, one bulb of which is heated by a resistance coil or strip carrying the current whose maximum is to be recorded. The thermometer contains a single drop of mercury, which serves the double purpose of a gas valve and a recording index. The expansion of gas in the heated cylindrical bulb causes a definite transference of gas past the mercury valve into the spherical bulb, corresponding to any given current, and on removing the thermometer from the heating coil, or switching off the current, the contraction of the gas in the cylindrical bulb, on cooling, causes the mercury to travel along the stem to a point determined by the total volume of gas originally transferred during the heating process. A special form of the instrument combined with an ordinary porcelain tube switch fuse is made for use in feeder pillars, &c.

DYNAMOS AND MOTORS.—Two recent lists from Messrs. Johnson & Phillips, Ltd., of Charlton, are to hand. One of these deals with continuous current dynamos, and gives prices for shunt and compound-wound machines for open, protected, and totally enclosed types, both for 110, 220, and 440 volts. The

Digitized by Google

other gives prices for alternating current motor and starters. The A.C. Motors lists are for two- or three-phase, and the prices cover for machines with wound rotors, and also short circuited rotors for pressures up to 500 volts. Protected, ventilated, enclosed, and totally enclosed type machines are dealt with. We are asked to state that copies will be sent to anyone interested.

FUSE BOXES.—New leaflets have been issued by British Insulated & Helsby Cables, Ltd., of special transformer fuse boxes for enclosed cartridge fuses with fittings mounted on corrugated porcelain insulators, and with separate disconnecting chambers lined with fireproof insulation; trifurcating boxes cut in halves, and provided with a brass gland for connecting a lead-covered three-core cable and porcelain terminal sleeves; and tramway section boxes with switch fuses.

GAS PRODUCER PLANT.—An attractively printed catalogue from Messrs. Joseph Baker & Sons, Ltd., gives particulars of the new Pearson Automatic Gas Producer, which can be seen in operation at pavilion No. 136 of the Franco-British Exhibition. One of the features of this plant is the use of a large charging hopper holding enough fuel for a 10- or 12-hour run, avoiding the necessity for disturbing the action of the producer by the opening of the charging door during a day's run. The arrangement of vaporiser forming a jacket round the hottest part of the fire, and therefore automatically governed by its heat, is also novel. A specially efficient scrubber is used, and also a chemical purifier. In this apparatus much cheaper qualities of fuel than suited to the ordinary suction producer can be used.

HOUSE FUSE BOXES.—A new catalogue from British Insulated and Helsby Cables, Ltd., deals with "Prescot" house fuse boxes of the separate pole, and multiple way types with asbestos-covered fuses.

INDESTRUCTIBLE CABLES.—A booklet from the Indestructible Cable Co. calls attention to the special cables made by this company to resist acid fumes, damp, and other atmospheric influences, and points out the various uses for which they present particular advantages. The insulation consists of a jute covering, impregnated with a mixture of red lead, linseed oil, and other patent ingredients, which become harder and of higher insulating property with time and exposure, and are said to form so hard a crust round the copper that it is practically impossible to cut through the coating with a knife.

METAL FILAMENT LAMPS.—An effective show-card has been issued by Simplex Conduits, Ltd., relating to Simplex metal filament lamps. Father Time is shown holding one of the lamps, which are described as being the light for all time.

PATENT LITERATURE.—Messrs. Browne & Co., of 9 Warwick Court, Grays Inn, patent agents, have just published a new edition of their chart giving information in a convenient form as to the conditions and procedure regarding British and foreign patents, designs, trade marks, and copyrights. This has been revised to include the provisions of the new Patent Act, and gives a great deal of useful information in a convenient form.

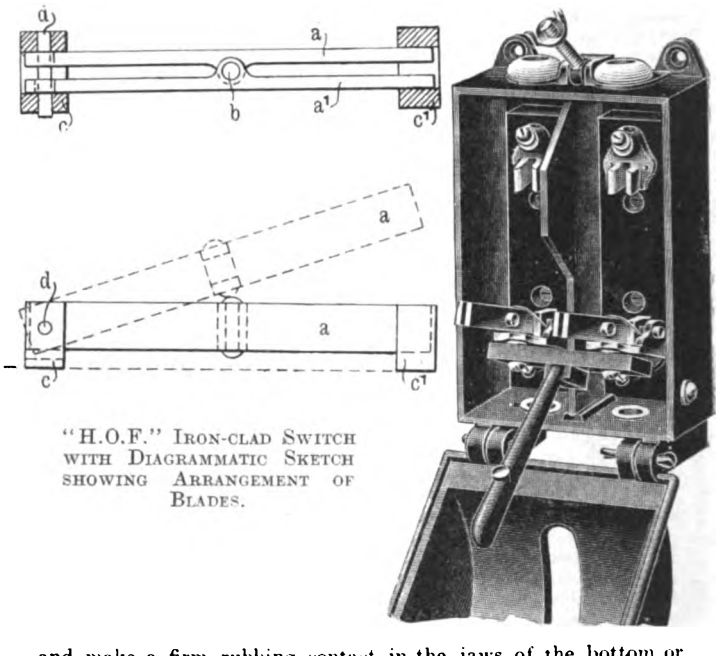
SHIP AND FACTORY FITTINGS, &c.—One of the latest catalogue sections to be issued by the Edison & Swan United Electric Light Co., Ltd., is a new edition of that devoted to ship, factory, colliery, street, and traction fittings. In addition to a variety of fittings of simple and substantial nature for the purposes named, including a series of all porcelain, non-corrodible fittings, particulars are given of special watertight and insulated nipple patterns of holder, and a dust- and damp-proof protector for ordinary lamp-holders.

SHOP WINDOW FITTINGS, SHADES, &c.—A leaflet from the Sun Electrical Co. gives particulars of the Adjusto patent window fitting, in which tubular lamps provided with reflectors are used, carried in holders, mounted on bail and socket fittings on T pieces at intervals along a tube. The whole is a self-contained fitting, easy to fix and very flexible in its applications, as the lamps can be burned individually in any direction and to any angle. A further list deals with special designs of glass shades for tantalum and Osram lamps.

The Marseilles Congress.—The Congress on the applications of electricity held in connection with the Marseilles Exhibition appears to have been attended by a considerable number of members, although the proportion in which different nationalities were represented were hardly such as to render it very international in character. The proceedings commenced on Monday morning, September 13th, when the Congress was opened by Prof. Maurice Levy in the absence of M. Berthou (Minister of Public Works). In the afternoon Prof. C. Fabry, of Marseilles, read a Paper on the electrical features of the exhibition, and the sittings of the nine sections into which the Congress was divided commenced the following day, and continued until the Thursday. As a general rule, however, only a few of the sections held meetings each day. Many of the discussions—and these covered a range of subjects too long to particularise—were long and vigorous, but a number of Papers announced appear not to have been read. In connection with the Congress, several visits were paid to generating stations and other electrical installations in the district. No official British delegate was present, and it is reported that Great Britain was only represented by two visitors.

A NEW IRON-CLAD SWITCH

THE accompanying illustrations represent a new iron-clad switch recently put on the market by Messrs. H. O. Farrell & Co., which presents some interesting features. As will be seen from the diagram, each blade is made in two portions hinged together at their centres, and so arranged that when the tip of the blade is compressed in entering the jaws of the top contact block, the other ends of the contact bars are forced apart

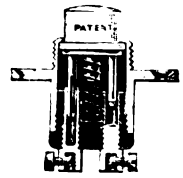


"H.O.F." Iron-clad Switch with Diagrammatic Sketch showing Arrangement of Blades.

and make a firm rubbing contact in the jaws of the bottom or pivot contact block. The contact pressure is thus equal at both ends of blade. In opening the switch, immediately the blade leaves the jaws of the top contact block, the pressure at the pivot end is relieved, and blade is free to move rapidly to the off position. Any wear at pivot end is taken up automatically and a good contact maintained indefinitely.

A NEW BELL-PUSH MOVEMENT

AMONG several novelties for the coming season which have been brought out by Messrs. A. P. Lundberg & Sons, is an entirely new pattern of bell-push movement, which has been particularly designed for combined outfits for shipboard and similar purposes, consisting of switch wall plug and bell-push all on one base, and combined to form a shallow surface or flush fitting, but equally applicable to ordinary purposes. The construction of the bell-push is seen from the accompanying section, which is self-explanatory. The action is easy and agreeable, and the outer shell is effectively insulated from current-carrying parts. The actual contacts are of platinum.



"Pixy" Bell Push.

"The Electron."—The third number of this magazine, which is conducted by the staff of the Siemens Stafford Works, maintains the good qualities shown in its predecessors. The frontispiece is a portrait of the late Sir William Siemens, an account of whose earlier work is also included. The two main features of the number are reprints of Papers on "The Plastic Deformation of Solids," and "Notes on Life of an Incandescent Lamp," read before the Siemens Stafford Engineering Society. Both of these are highly mathematical, but lighter literature is also present in the shape of a sensational tramway story, entitled, "The Last Car," and the chronicles of the doings of the various Siemens literary, athletic, and other societies.

Proposed London Electric Railway.—A meeting was held at the Westminster Palace Hotel on Wednesday last week to consider the scheme referred to in our last issue for the construction of a new railway 4¾ miles in length, linking up the London & South Western and the Metropolitan District Railway systems at Wimbledon with Sutton and the intermediate districts. It is estimated that the necessary land could be purchased, and the line constructed for £250,000. A resolution was passed in favour of the proposal, and a committee was formed to consider, and, if thought fit, to carry forward the scheme. The proposal is to be the subject of a separate Bill in Parliament.

SUMMARY

Descriptions of the exhibits at the Manchester Exhibition are contained in the fourth of our series of supplements which accompanies the present issue.

Mr. A. du Pasquier suggests in our correspondence columns that the recent accident at the Underground Railways generating station might have been avoided if certain precautions had been taken—for instance, the use of bare copper from the generator cable trifurcating-box to the trifurcating-boxes for the feeders, or the employment of oil switches with top connections. Messrs. Handcock & Dykes and Messrs. Nalder Bros. & Thompson, writing with reference to Mr. G. Wilkinson's letter in our last issue, call his attention to the latter firm's limit switch. (Page 560.)

An electric mineral railway 2¼ miles in length is in use in connection with the Consett Iron Company's Chopwell Colliery. The line is worked by a Siemens' 14-ton electric locomotive equipped with two 56 h.p. continuous-current motors, taking current from a 500-volt overhead line. One motor is carried on each of the two bogies, and the wheels of each bogie are coupled. The latest form of bow contact is used. A telephone line runs along the same posts as the trolley wire, and special precautions are taken to prevent damage should the wires come into contact. (Page 561.)

A list of the awards for electrical exhibits at the Franco-British Exhibition is given on page 563.

At the quarterly meeting of the Northern Section of the Electrical Contractors' Association, which was held at Manchester on Saturday last, the question of the prejudiced interference of Corporation officials, and more especially fire insurance inspectors, with the work of electrical contractors was brought up. After a discussion on the subject, the matter was referred to headquarters for consideration. At the "Propagandist" meeting held in connection with the Electrical Exhibition, Mr. L. G. Tate, the Secretary, gave a lucid account of the origin, aims, and successes of the Association. (Page 564.)

The sittings of the International Conference on Electrical Units and Standards have been continued during the week, and agreement has been arrived at regarding the ohm and ampere as primary units as represented by a column of mercury and the indications of the silver voltameter respectively. Other matters discussed have included specifications for standard cells for use as practical standards of voltage, and a scheme for the establishment of a permanent international authority to deal with such matters in future. (Page 564.)

An instruction to the Committee which will consider the London and District Electricity Supply Bill was passed in the House of Commons on Monday to the effect that the London County Council should be named in the Bill as the purchasing authority. There was considerable opposition on the part of members representing constituencies in the area scheduled in the Bill, but outside the London County area, on the ground that the purchasing authority should be composed of representatives of all authorities owning electrical undertakings. Another section of the opposition desired the House to deal with the details of the purchase clause, but Mr. Churchill, on behalf of the Government, explained that it was the desire to have the Bill thoroughly examined by a Committee, and if some of the clauses did not meet with approval when the Bill was returned to the House, members would be free to vote as they wished. (Page 566.)

In answer to a number of questions in the House of Commons on Monday, the Postmaster-General stated that the National Telephone Co. were not suspending their construction work, but had stated that it would not be to their interests to undertake the construction of new plant which would not be brought into use before the end of their licence. In this way a certain number of employees were being discharged, but the Post Office was doing its best to find employment for these men. A circular issued by the National Telephone Staff Transfer Association suggests a joint purse arrangement between the Post Office and the company, to enable further construction work to be carried out. (Page 566.)

On Saturday last 25,000 people visited the Electrical Exhibition at Manchester. The rumour that has been circulated that the Exhibition will be kept open until November 14th instead of being closed on October 31st is without foundation. (Page 567.)

In the report of the Bradford Technical College for the session 1907-8 regret is again expressed at the absence of an adequate equipment in the electrical engineering section.—A return recently issued shows that the Edinburgh street lighting includes 1,193 arc lamps. —In dealing with the work of the electrical undertaking of the Liverpool Corporation for the past year, Sir Charles Petrie, the Chairman of the Electricity Committee, states that a sum of £27,500 has been contributed to the relief of rates.—Mr. W. M. Mordey is to receive a fee of 250 guineas for his report upon the working of the G.B. surface contact system in London. —The L.C.C. has decided to put in hand new tramway works at an estimated cost of £281,265.—In the elective auditor's report to the St. Helens Corporation it is suggested that the only alternative to meeting the continued loss upon the tramways, which are leased to a company, is for the Council to work the lines themselves.—The Southampton Corporation is recommended not to assent to the proposal of a London company to run a service of electrical omnibuses.— The sale of the Swansea municipal telephone service resulted in a profit to the Corporation of £927. In their report upon the electricity undertaking at Swansea the elective auditors call attention to the absence of provision for depreciation. (Pages 567-569.)

The Manchester Corporation require high-pressure steam and feed pipes, &c., at the Stuart Street power station. A storage battery is required at Epsom, stores by the London County Council, and a wheel-turning lathe by the Salford Tramways Committee. The Local Government Board has sanctioned loans of £10,500 for electrical purposes at Stockport and £18,400 at Maidstone. (Pages 569-570.)

The report of Messrs. Ferranti, Ltd., for the year to June 30th shows a net balance of £3,275, after deducting all expenses and charges including allowance for depreciation, debenture interest, &c. Prior lien debentures for £20,000 have been issued during the year. After payment of all charges there is a net profit of £7,577 shown in the accounts of Messrs. Drake & Gorham for the year ended June 30th. A dividend of 5 per cent. is declared, carrying forward £1,327. The Electric Supply Corporation's accounts show profits amounting to £5,456, an increase of nearly 100 per cent. over the previous year. The debenture interest, and interest on temporary loans, has been paid, in addition to 5 per cent. on the share capital from the sum received from the guarantors. At the meeting of the Cleveland & Durham Electric Power Company last week, reference was made to the serious effect which the engineering strike, coupled with general trade depression, has had upon the Company's business during the past year. (Page 571.)

In a paper read before the Verband Deutscher Elektrotechniker by Mr. H. Remané, of the Auergesellschaft of Berlin, the relative running costs of small open and enclosed arc lamps and high candle-power metal filament lamps are compared. On the basis of average figures for candle-powers and current consumptions in both cases curves are deduced, which point to the conclusion that for light units of between 100 and 500 mean hemispherical candle-power the Osram lamp is both more efficient as regards current consumption, and more economical even when the costs of renewals are included. (Page 573.)

The first meeting of the Council of the Electrotechnical Commission was held at the new home of the Institution of Electrical Engineers, Victoria Embankment, on Monday, when the Rt. Hon. A. J. Balfour gave an address of welcome. Owing to the lamented death of Lord Kelvin, the chair was taken by Sir John Gavey. Prof. Elihu Thomson was unanimously elected President of the Commission for the coming year, and Col. Crompton hon. secretary. In his report, the hon. secretary detailed the work that has been done up to date, and stated that in ten countries, electrotechnical committees had been officially constituted and were in full working order; in six countries committees will be formed shortly, and in six countries the matter had been considered with a view to forming such committees. A vote of thanks was passed to the Institution of Electrical Engineers for the part they had taken in the formation of the Commission. (Page 575.)

A new bedside switch and a new pattern of distribution board are described in short articles on page 574.

Among the patent specifications published by the Patent Office on Thursday last is one by Eversheds & Vignoles, Ltd., and S. Eversheds, describing a direct-reading potentiometer for measuring low resistances; the indicating instrument is provided with differentially acting, moving coils. Another by M. Cummins provides for interlocking arrangements to prevent a tramway driver from trying to use a magnetic brake with the wheels skidding. The application of centrifugally-operated switches for bridging over cuts in the rotor rings of a squirrel-cage induction motor when the motor speeds up is patented by the British Thomson-Houston Co. The preparation of wood for use as separators or supports in accumulator cells is described in a specification by the Chloride Electric Storage Co., Ltd., and B. Heap, and a form of tumbler switch for heavy work is patented by W. H. Flood. A patent for a particular form of electrolytic apparatus, granted to C. Kellner, and two others granted to H. J. Creffield, and W. Alexander and W. E. Thompson, for an arc lamp cut-out and a prepayment meter respectively, expire during the current week. Short abstracts of these are given in our Patent Record. (Page 578.)

Digitized by Google

Mr. George Wilkinson, in a letter which we published last week, referring generally to some of the problems introduced by the extended use of metal filament lamps, mentioned, among other things, the desirability of a change in the methods of charging small consumers for current. There are now a large number of consumers, or potential consumers, whose demand is so small that, even if it starts the meter, it represents a yearly bill not very much greater than the meter rental that should be charged; and it is almost self-evident that such consumers must be put on a contract system of charging instead of on meters. In small districts we favour the use of locked lamp-holders and free lamp renewals as a part of the contract; some supply station engineers, however, are searching for a limit switch to use in such cases, which dims the lamps or causes them to flicker when the consumer's demand exceeds that which he has contracted for. The limit switch has also been proposed by Messrs. Handcock & Dykes, in conjunction with a meter for their "contract demand" system of charging, but it is to the smaller consumers, whose demand does not justify the provision of a meter, that Mr. Wilkinson particularly refers. He asks for a suitable limit switch, and one firm has already replied that they have one on the market; by a coincidence this very switch was described in our columns in the same issue as Mr. Wilkinson's letter was published. We described two other devices for this purpose a few weeks ago, both of German manufacture, but apparently Mr. Wilkinson desires a greater variety to choose from, and something cheaper. Perhaps other makers can offer alternative designs, or possibly Mr. Wilkinson has an idea of his own "up his sleeve." In the meantime we trust that the perennial subject of systems of charging will be allowed to rest for the present. We were fed to repletion with the subject during the last session of the Institution of Electrical Engineers, and we regret to hear a well-authenticated rumour that the first Paper to be read at a London meeting in the coming session will deal with the same question. We trust that we have been misinformed, and that the debates at the Institution will be inaugurated with a discussion of a more attractive topic, and one with a closer application to electrical engineering problems. There will always be full scope for discussions on systems of charging at Board meetings of Companies, in Committee and Council Chambers of Local Authorities, and at the Incorporated Municipal Electrical Association; the Institution of Electrical Engineers has a wide field of engineering subjects to choose from, and need not allocate a large proportion of its time to the same commercial problem for two sessions in succession.

On Monday the London and District Electricity Supply Bill was sent to committee with an instruction that the London County Council is to be named in the Bill as the purchasing authority. This, in itself, is a comparatively small point, at any rate from the promoters point of view, having in mind the larger issues which several opponents of the Bill wished to have settled during the second reading debate. Thanks to the Government supporting the principle of the Bill, however, any such action was prevented, and the Bill will now come before Mr. Luke White's Committee unfettered save by the proviso that the name of the London County Council must be inserted as the purchasing authority. On all other points the Committee will have the fullest freedom of action, and, in the absence of an undue prolongation of the proceedings by the proposition of superfluous amendments on clauses on the part of opponents, which Mr. Luke White's long experience as a Chairman of Committees should enable him to prevent—there is good prospect of the Bill passing, after a certain amount of modification. As we have already pointed out, the purchasing authority has been definitely settled, but we are inclined to agree with the decision of Lord Cromer's Committee that there was no urgency for this, and that it would have been best to leave the matter open for the future. Political opinions change with such startling rapidity nowadays that it appears unwise to legislate for posterity in this manner. Further, the extension of the London county boundary to include, at any rate, a large proportion of the outer districts scheduled in the Bill, is a dream of many interested in London government, so that a postponement of the question would have been in the best interests, and would have reconciled at least one conflicting interest at the present time. However, the prospects are all in favour of the promoters of the Bill,—if they meet the Government on some matters of detail, to the modification of which, it appears, the Board of Trade attach considerable importance.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, OCTOBER 22ND.

Institution of Electrical Engineers.

7 for 7.30 p.m. Annual dinner at the Hotel Cecil.

FRIDAY, OCTOBER 23RD.

Physical Society.

3.30 p.m. Meeting at the National Physical Laboratory, Teddington. A council meeting will be held at 3.30 p.m., and it is proposed to show a series of demonstrations of work in progress in the laboratory, which will be on view from 3.30 p.m. onwards.

Institution of Electrical Engineers, Manchester Local Section.

7.30 p.m. Opening meeting of the session at the Midland Hotel, Manchester, when the Chairman, Mr. Miles Walker, will deliver his address. A smoking concert will follow the address, and visitors attending the exhibition are cordially invited.

Electro-Harmonic Society.

8 p.m. First smoking concert of the season in the King's Hall, Holborn Restaurant, London, Sir John Gavey, C.B., in the Chair. The members of the International Conference on Electrical Units and Standards, and of the International Electrotechnical Commission have been invited.

TUESDAY, OCTOBER 27TH.

Institution of Electrical Engineers, Manchester Students' Section.

7.30 p.m. Supper and Smoking Concert at the Grand Hotel, Aytoun Street.

WEDNESDAY, OCTOBER 28TH.

Institution of Electrical Engineers, Leeds Local Section.

7 p.m. First meeting of the session at the University, when the Chairman, Mr. H. E. Yerbury, will deliver his address, which will be followed by a Paper on "Electric Signalling on Railways," by Captain Gardner, R.E.

CORRESPONDENCE

ACCIDENT AT CHELSEA GENERATING STATION.

To the Editor of Electrical Engineering.

Sir,—Mr. Oswald B. Davis's letter in your last issue hardly suggests the best methods to be adopted to prevent such an accident in the future. Had any of the following precautions been taken the complete shut-down would probably have been avoided, and if all of these had been adopted, as is the practice of at least one of the largest manufacturers in England, it is practically certain that only the one unit would have been effected:—

1. Systematic use of bare copper from generator cable trifurcating box to the trifurcating boxes for the feeders.
2. All tubes or ducts through floors efficiently closed.
3. Oil switches with top connections, not at opposite ends, as Mr. Oswald Davis suggests; there are always objections to bottom contacts, and this type is rapidly being discarded.
4. Some form of static discharger, and there are several, which has more arc suppressing property than the straight series gaps employed in this instance.

Yours truly,
A. du Pasquier.

Copenhagen, October 19th, 1908.
11, Vestervoldgade.

SYSTEMS OF CHARGING AND LIMIT INDICATORS.

To the Editor of Electrical Engineering.

Sir,—We have read with interest Mr. Wilkinson's letter in your issue of October 15th, calling attention to the necessity of charging for lighting current on a different basis from that generally in vogue. The fact that the introduction of the metallic filament lamps would seriously affect the great majority of the purely lighting stations, and also the remedy, was pointed out in the Paper on the subject read by us before the Institution of Electrical Engineers in London, Glasgow, and Dublin at the beginning of the year.

We then stated that most of the systems of charging in use at the present time tend directly to discourage the profitable long-hour consumer, and suggested a method of charging which we called the "contract demand system," in which the consumer could himself fix what was the maximum demand he would make on the station, and would be charged a rental accordingly, sufficient to cover the standing charges thus entailed, all current consumed being supplied at a low price per unit, sufficient to just give a reasonable profit on top of the running costs.

In order that the agreed contract demand should not be exceeded, we proposed a limit indicator presenting a number of novel features. If Mr. Wilkinson will make inquiry at Messrs. Nalder Bros. and Thompson's stall at the Manchester Exhibition we feel sure that their representative will be only too glad to show him a limit indicator, designed and made in England, which will meet all his requirements, except possibly the one that it can be bought for 10s.

Since our Paper was written, reports from stations all over the country have only too clearly confirmed our expectation of a large falling off in revenue with no corresponding diminution in expenditure. Further experience with the contract demand system has amply justified its use and shown that it can be introduced in a most simple manner.

Whilst in the case of new consumers the price per kilowatt of demand can be fixed simply with regard to the standing and running charges of the station, it has been objected that it is difficult to change over to the new system old consumers who have been paying a flat rate. Suppose such a consumer has 100 lamps connected and uses 50 at once with a consumption of 1,000 units per annum for which he has been paying a flat rate of 4d. per unit; his account has thus been £16 13s. 4d. per annum. Would it not appeal to him if he were asked to pay a fixed rental of £12 10s. per annum as long as his maximum current did not exceed the equivalent of 50 lamps on at once, and one penny per unit for all current consumed? If his consumption were the same, his bill would be no greater, whilst if he used more, the extra current would only cost him a very small sum—1d. per unit instead of 4d.—and he could use fans, heating, and other appliances without needing to go to the expense of separate wiring.

At the same time, the station would be receiving £8 6s. 8d. per kilowatt (contract demand, 50 lamps at 30 watts = 1·5 kw.) as rental, and would almost certainly secure a long-hour consumer, for actual experience has now proved that, under these circumstances, consumers do burn their lamps longer hours, and also put them in places where previously they had used gas.

We are, Sir,
Yours truly,
Handcock & Dykes.

1 Victoria Street, London, S.W.,
October 19th, 1908.

To the Editor of Electrical Engineering.

Dear Sir,—In your issue of October 15th you publish a letter from Mr. Wilkinson, of Harrogate, on the subject of limit indicators, for use with the system of charging advocated by Messrs. Handcock & Dykes in their recent Paper read before the Institution of Electrical Engineers, and in that letter he points out that he is only aware of the limit indicators made by German manufacturers. We trust we shall not be damaging our character for modesty in drawing attention to the limit indicator which you were good enough to describe in the same number, and which we are exhibiting at the Manchester Exhibition.

We shall be glad to furnish full particulars to any station engineer who is interested in this matter, and in particular those who are face to face with the problem of making both ends meet.

As we are loth to follow the example set by some firms of instrument makers in using the columns of the technical press to obtain gratuitious advertisements, we will not touch upon the question of price.

Faithfully yours,
Nalder Bros. & Thompson, Ltd.,
Fras. H. Nalder,
Managing Director.

34 Queen Street, London, E.C.,
October 20th, 1908.

Committee on Tramway Brakes.—The report of the committee appointed some time ago by the Tramway & Light Railways Association to go into the matter of braking arrangements and sanding gear on tramcars has now been completed, and is ready in print. In deference to the wishes of the Board of Trade, however, a conference will be convened between representatives of the Tramway and Light Railways Association and the Municipal Tramways Association, presided over by a representative of the Board, in order to prevent any inconvenience by the publication of recommendations upon which the two associations are not unanimous. This conference will be held on Friday, October 30th, at the Board of Trade, and meanwhile the official circular of the Tramway & Light Railways Association for September, which consists of a special number containing the verbatim report of the Brake Committee, is being withheld.

AN ELECTRIC COLLIERY RAILWAY

THE electric railway at the Consett Iron Co.'s Chopwell Colliery possesses several points of interest both for traction engineers and for colliery owners and managers. It is chiefly interesting as being the first installation of the kind in the North of England, and the innovation reflects great credit on this company's Mining Engineer, Mr. F. O. Kirkup, to whose initiative the construction and electrical equipment of the line are due. The line connects the Chopwell Colliery with a new winning at Whittonstall about two and a quarter miles distant. The coal at Whittonstall is loaded into tubs which are made up into a train of 36, and hauled by means of an electric locomotive to the screening plant at the Chopwell Colliery. In this way the installation of a large amount of new and expensive stationary plant is avoided, and it is possible to work new isolated seams economically, which would otherwise be a doubtful commercial undertaking.

The most interesting feature of the installation is the electric locomotive. The difficulty of constructing a suitable locomotive may be appreciated from the following conditions:—

Length of line	About 2¼ miles
Maximum gradient against the load	1 in 24
Length of maximum gradient	About 720 yards
Average gradient against the load	About 1 in 47
Gauge of the track	26 inches
Load to be hauled (exclusive of loco)... ..	25 tons
Time allowed for each journey of two miles...	10¾ minutes
Frequency of service	2 double journeys per hour

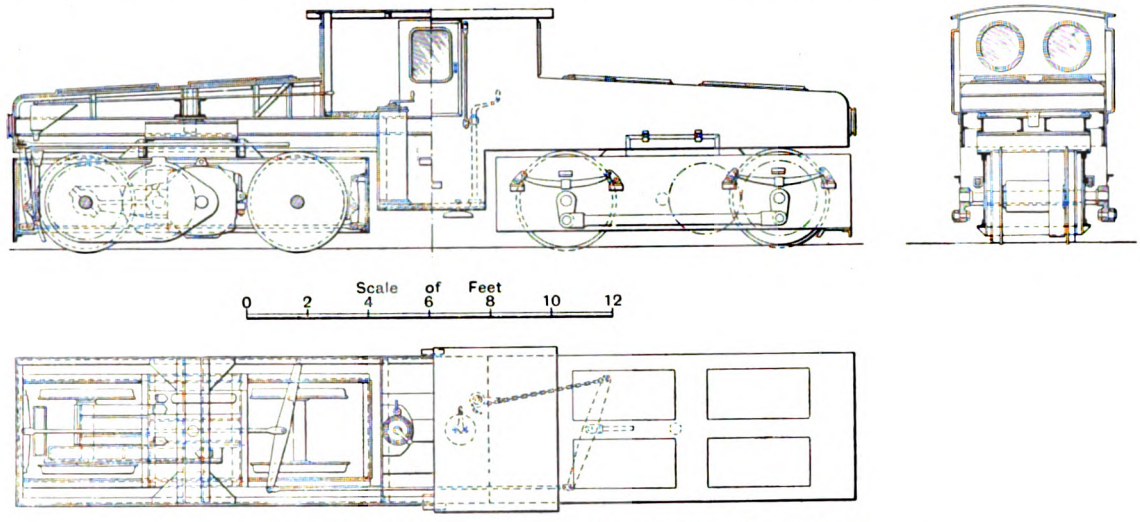

FIG. 1.—PLAN AND SECTIONAL ELEVATION OF LOCOMOTIVE.

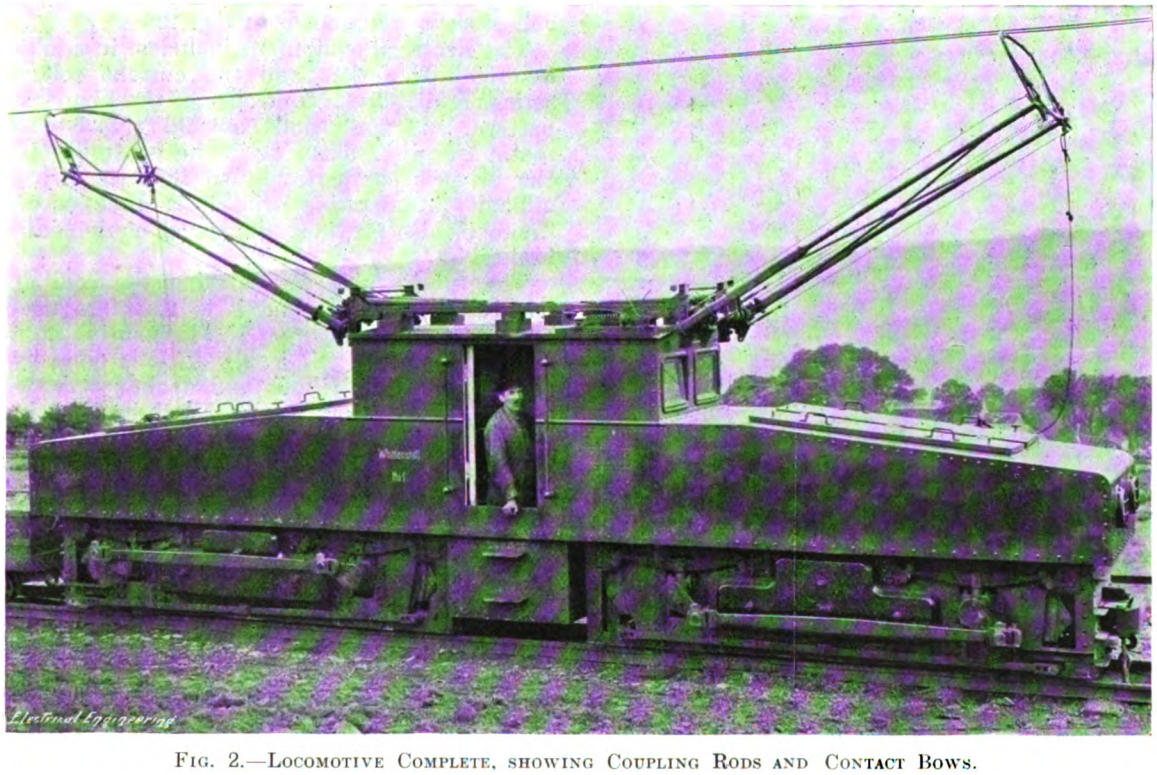

FIG. 2.—LOCOMOTIVE COMPLETE, SHOWING COUPLING RODS AND CONTACT BOWS.

From these conditions it will be obvious at once that a powerful locomotive is necessary, and at the same time that the narrowness of the gauge imposes severe

Digitized by Google

restrictions on the motors if suspended on the bogies in the usual way. Under the conditions stated above, the largest motors that could be got in between the wheels would have a capacity of about 20 h.p. for one hour. A locomotive with four such motors would not perform the required service, and it was necessary to adopt some different arrangement by which larger motors could be employed.

The design of the locomotive actually supplied is shown in the accompanying drawing (Fig. 1). The body is supported on two bogie trucks, each of which is equipped with a single 56-h.p. 500-volt Siemens railway motor, the aggregate capacity being, therefore, 112 h.p. The two axles of each bogie are connected together by side rods, in order to utilise the whole weight of the locomotive for adhesion (see photograph, Fig. 2), and one of the axles is driven through spur gearing by the motor. This gearing consists of two equal gear wheels and one pinion, the pinion being fixed on the motor axle, one gear wheel on an intermediate shaft, and one on the driving axle. In this way the motor is not restricted axially by the narrowness of the gauge, but only by the distance between the side frames of the bogie. As the motor occupies the space in the centre of the bogie, the usual arrangement of centre pin and bolster is in this case impossible. The centre is mounted on an arch built of steel plates and beams which rests on the top of the side frames, and the centre pin is carried by cross-beams rigidly fixed to the locomotive body. There are also fixed to the body side rubbing blocks which bear upon similar blocks supported on the bogie by means of helical springs, not shown in the illustration. There is thus as much flexibility in this construction as in the standard bogie with bolster and bolster springs. The centre pins are spherical in shape, and work in cup-shaped centres, so that ample bearing surface is provided for transmitting the tractive force from the bogie to the frame of the locomotive body.

The locomotive body is built up on two main longitudinal steel girders, which are themselves supported

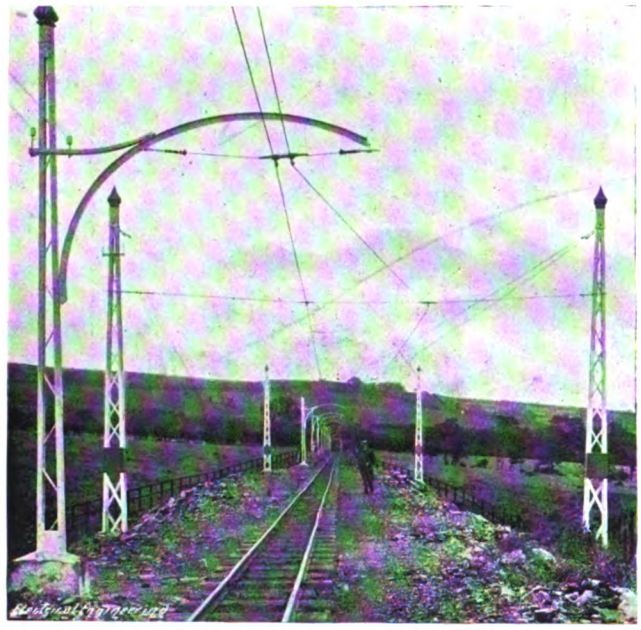

Fig. 3.—Arrangement of Overhead Equipment at Turn-out (for which Track Rails are not yet Laid).

by cross-beams from the bogie centres. The space between the bogies is utilised for the lower part of the driver's compartment. In this way the height of the locomotive is reduced so that the line can be taken under a roadway without excessive excavation. On the roof of this compartment is fixed a frame, forming the base of two current collectors of the Siemens bow type, which are of such a length as to allow of a considerable range in the height of the trolley wires. The movable portion of the collector is made in two parts, viz., the main frame of light steel tubes hinged at the

Fig. 4.—Track and Overhead Equipment at Junction near Chopwell.

bottom to the fixed base, and the small bow carried by this frame. The action of the various springs tends to raise the main frame and to keep the small bow in a vertical position. The pressure of the trolley wire balances this spring action in such a way that both the small bows are always trailing at a small angle in whichever direction the locomotive may be running. The general arrangement and the construction of these collectors is well shown in Fig. 2.

The electrical equipment includes, in addition to the two 56-h.p. motors and the current collectors, one series-parallel-brake controller of the Siemens standard pattern, and the usual controlling resistances, automatic circuit-breaker, &c. The controller is fixed in the driver's compartment so that the driver has no difficulty in operating it in either direction of running. There is also provided the usual equipment of hand-brakes.

The tubs hauled for carrying the coal are of the usual colliery type, and it is therefore necessary to arrange the drawgear on the locomotive at a suitable height above the rail level. This is done by fixing a central buffer with hook and chain on the end frame of the bogie, the outer ends of both bogies being utilised for this purpose, so that the locomotive is double-ended. With this arrangement the tractive force transmitted by the frame of the locomotive body is only that due to one motor.

The following are the particulars and leading dimensions of the locomotive:—

Total weight, including about 4 tons of ballast	14 tons
Gauge	660 mm. (26″)
Overall length	8·46 metres (27′9″)
Overall width	1·5 metres (4′11″)
Height to top of driver's compartment ...	2 25 metres (7′4½″)
Minimum height of trolley wire	2·44 metres (8′0″)
Maximum height of trolley wire	4·42 metres (14′6″)
Distance between bogie centres...	4·5 metres (14′9″)
Wheel base	2 metres (9′7″)
Diameter of wheels	900 mm. (2′11½″)
Motor equipment	Two 56 h.p. motors
Height of drawgear above rail level	267 mm. (10½″)
Height of buffer above rail level	380 mm. (15″)

Digitized by Google

Some interesting trials have been made to ascertain the tractive resistance of the locomotive and of the tubs. The tests were made by allowing a train to start from rest on a down grade, and measuring the distance passed over before coming to rest again on the next ascending grade. The following results were obtained: For a train of 10 tubs alone at an average speed of 5·8 miles per hour, the tractive resistance was 36 lb. per ton. For the locomotive alone at an average speed of 9 miles per hour, the tractive resistance was 15·5 lb. per ton.

The track consists of Vignole rails weighing 50 lb. per yard, the gauge being 26 inches. The rails are each 30 ft. long, and are bonded by means of a single bond at each joint, having a cross-section of about 70 sq. mm. The bonds are of the " protected " type, placed under the fish-plates.

The line is a single track for most of the distance, expanding into three tracks at the Chopwell end, and

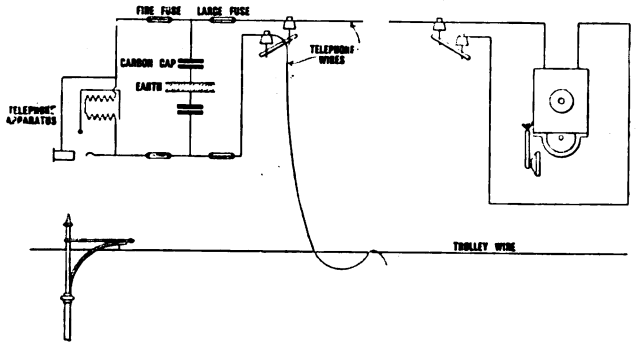

Fig. 5.—Diagram of Protective Device for Telephone Circuits.

into two tracks at Whittonstall, being laid out at this end in the form of a triangle in order to facilitate turning the tubs end for end. There is also a short branch near Whittonstall to a fresh working at Hollin's Drift, and a turn-out about the middle of the line allowing up and down trains to pass. A general view of the track is shown in Fig. 3, which also shows the arrangement of the overhead line for a turn-out, the rails for the second track being not yet in place. The overhead line consists of two trolley wires of hard-drawn figure 8 copper wire of 80 sq. mm. cross-section. These wires are supported by means of side brackets bolted to lattice poles, which are set in concrete foundations beside the track. The construction is well shown in Figs. 3 and 4, the latter giving a view of the divergence of the single track at the Chopwell end into three tracks. The overhead line at this point requires special construction, as the tracks are not at the same level. As will be seen, one of the poles carries two brackets, one considerably higher than the other. The third track is only equipped for a short distance from its divergence, the tubs running down the other part under gravity.

A telephone line is installed by means of two wires supported by insulators on the tail ends of the brackets. This line is tapped at six points between Chopwell and Whittonstall, and the driver of the locomotive carries with him a portable telephone with which he can make connection through plug boxes fixed on the poles.

At each of these points at which the line is tapped a protection device is inserted to guard against the danger of shock if either of the telephone wires has come into contact with the overhead wires supplying the locomotive. This device consists of two large fuses, two carbon gaps, and two fine fuses arranged as shown in the diagram, Fig. 5. The large fuse melts with a current of three amperes, and the fine fuse with 0·3 ampere. In the event of either wire being subjected to any voltage greater than 350 volts, the corresponding carbon gap arcs across to earth and the current immediately blows the large fuse; in case the gap does not discharge, and there should be any leakage to earth in the telephone apparatus, the fine fuse will melt and cut off the connection with the overhead wire. These devices, which are made by Messrs. Siemens and Halske, of Berlin, are used in large quantities on the Continent.

Power is supplied to the locomotive from a 200-kw. direct-current compound Siemens generator, giving 500 volts on no load, and 550 volts at 120 kw., coupled direct to a Belliss engine running at 375 revolutions per minute. The power-house is situated about 600 yards from the railway near the Chopwell end, and is connected to the overhead line by means of two positive and one negative insulated feeder run through earthenware pipes in a trench.

The whole of the electrical installation, including the locomotive, the overhead equipment, and bonding of the line, and the 200-kw. generator, with its accessories, has been supplied to the Consett Iron Co. by Messrs. Siemens Brothers Dynamo Works, Ltd. On the successful setting to work of the installation, a second locomotive was ordered from the same firm in order to deal with the increasing output of coal.

FRANCO-BRITISH EXHIBITION

Awards for Electrical Exhibits

We give below the list of awards for the purely electrical engineering exhibits at the Franco-British Exhibition. Several of the firms mentioned below were also awarded diplomas in other sections:—

Mechanical Production and Utilisation of Electricity.—*Diploma for Grand Prize.*—C. A. Parsons & Co., Ltd.; Mather & Platt, Ltd. *Diploma of Honour.*—W. H. Allen, Son & Co., Ltd.; Reyrolle & Co., Ltd.; Lancashire Dynamo & Motor Co., Ltd. *Diploma for Gold Medal.*—Adams Manufacturing Co., Ltd.; Electromotors, Ltd.; Simplex Conduits, Ltd.; United Asbestos, Ltd.; Watson, Laidlaw & Co.

Electrochemistry.—*Diploma for Grand Prize.*—Sherard, Cowper-Coles & Co, Ltd. *Diploma for Gold Medal.*—Berry, Skinner & Co.; Ozonair, Ltd.; Dr. Henry F. S. Sand.

Electric Lighting, Lamps, Switches, and Accessories.—*Diploma for Grand Prize.*—C. A. Parsons & Co., Ltd.; W. H. Allen, Son, & Co., Ltd.; Ediswan & Swan; United Electric Light Co., Ltd.; Reason Manufacturing Co., Ltd.; Davis & Timmins; Simplex Conduits, Ltd.; the London Decorative Metal Works, Ltd. *Diploma of Honour.*—Linolite Co.; Wm. Geipel & Co.; Sunbeam Lamp Co., Ltd.; A. P. Lundberg & Son; Humbert & How; United Asbestos Co., Ltd.; Reyrolle & Co., Ltd.; British Westinghouse Electric & Manufacturing Co., Ltd.; Stearn Electric Lamp Co.; Berry, Skinner & Co., Ltd.; Louis Hervé. *Diploma for Gold Medal.*—Wellman, Seaver & Head, Ltd.; Westminster Engineering Co.; Birmingham Guild of Handicraft. *Diploma for Silver Medal.*—Galsworthy, Ltd.; Imperial Lighting Co. *Diploma for Bronze Medal.*—John Dugdill & Co.; Duncan, Watson & Co.

Telegraphy and Telephony.—*Diploma for Grand Prize.*—Dr. J. A. Fleming, F.R.S.; Marconi's Wireless Telegraph Co. *Diploma for Gold Medal.*—C. E. Heinke & Co. *Diploma for Silver Medal.*—Cable Code Condenser.

Various Appliances of Electricity.—*Diploma for Grand Prize.*—Dowsing Radiant Heat Co., Ltd.; Cambridge Scientific Instrument Co., Ltd. *Diploma of Honour.*—Bastian Meter Co., Ltd.; Reason Manufacturing Co.; Alfred Apps. *Diploma for Gold Medal.*—Rashleigh, Phipps & Co., Ltd.; Bergtheil & Young, Ltd.; Kinetic Swanton Co., Ltd.; Professor Townsend; Dr. F. Mollwo Perkin; Marryat & Place; Dr. P. E. Shaw. *Diploma for Silver Medal.*—Rochdale Electric Co., Ltd.; Purcell & Nobbs; Reynolds & Branson.

Incandescent Lamp Research.—According to the *Electrical Review* (New York), the engineering department of the National Electric Lamp Association, Cleveland, Ohio, announces that Dr. Edward P. Hyde, now the U.S. Bureau of Standards, Washington, after October 1st will organise and direct a department of physical research under the auspices of, and at the expense of, the association. Dr. Hyde will operate his department with entire freedom from commercial suggestion, and with the same frank publicity which has characterised his work at the Bureau of Standards.

ELECTRICAL CONTRACTORS' GRIEVANCES

THERE was a very fair attendance of members of the Electrical Contractors' Association at the quarterly meeting of the Northern Section, which was held on Saturday last in some school buildings near the Electrical Exhibition at Manchester. Few visitors were present, however, and this was particularly unfortunate, as it had been arranged to hold a "Propagandist" meeting after the general business had been dealt with.

One of the items of the agenda was the consideration of a letter received from a member of the Association, complaining of interference by fire insurance inspectors with the work of electrical contractors. The writer of the letter said that cases had come under his notice where fire insurance inspectors had practically acted as consulting engineers; they had raised questions with regard to the quality of the contractors' work and the methods adopted; had pointed out insignificant defects in the work, often quite temporary defects due to the presence of moisture, as, for example, in freshly constructed buildings; and had generally shaken the confidence of the consumer in the contractor. Several members supported the view of the writer, that measures should be taken to stop such interference; some suggested, however, that even more harm was being done by Corporation central station officials acting as consulting engineers, sometimes not without prejudice to the contractor concerned.

The chairman of the meeting, Mr. Andrews, of Newcastle, pointed out that the interference of the Corporation officials had in certain cases been amply justified, but that it was very necessary to prevent abuse or prejudiced interference. It was then proposed to submit the matter to consideration at headquarters, with the suggestion that a circular letter should be sent to insurance companies and corporations with reference to the matter. Mr. Cross, a late chairman of the Northern Section, proposed that the two questions should be considered separately, as the fire insurance inspector was in quite a different position with relation to the contractor than that of the Corporation official.

Another member suggested that the prejudiced interference of the Corporation officers could be prevented more effectively by arranging for a personal interview between the local secretary of the Association and the chief engineer of the Corporation concerned than by writing letters; a circular letter also would be offensive, as the number of cases in which such interference had been noticed were not many. Finally, it was decided to adopt this suggestion, and to forward the letter, referring to the fire insurance inspectors, to be dealt with by the Central Board, without any mention of the similar question relating to Corporation officials.

The "Propagandist" work was then proceeded with, the chairman calling upon Mr. L. G. Tate, the Hon. Secretary of the Association, to explain to the visitors present the origin and objects of the Association.

Mr. Tate pointed out the Association had its origin in Glasgow in 1901, when the contractors joined forces to combat the growing danger of branches of municipal trading prejudicial to their interests. Newcastle, Leeds, Manchester, and London soon took the matter up, and in 1902 the National Electrical Contractors' Association was formed. The two great objects before the Association were opposition to municipal trading, and the settling of disputes between contractors and manufacturers, especially with regard to the question of manufacturers supplying goods to consumers at trade prices. In 1904 an agreement was entered into with the National Electrical Manufacturers' Association, and the term "trade buyer" was rigorously defined. A joint committee of four manufacturers and four contractors was formed at the same time to deal with such questions. In September, 1904, the Association became incorporated, and the name was changed to "The Electrical Contractors' Association." Mr. Tate said that considerable help had been given to contractors in defending them against Corporation "fads," such as the enforced use of stranded wire, and also that, as the result of contractors meeting frequently in a friendly spirit, much suicidal competition had been stopped and co-operation substituted, with great benefits to the contractors concerned. An agreement with the Cable Makers' Association as to trade terms had had very beneficial results, and many individual cases could be stated in which members had been materially assisted by the financial, legal, and moral support of the Association.

THE INTERNATIONAL CONFERENCE ON ELECTRICAL UNITS AND STANDARDS

THE first few days' meetings of the International Conference, which has been sitting at Burlington House, in the rooms of the Royal Society, to arrive at international agreement as to the three electrical units, the ohm, the ampere, and the volt, were reported in our last issue. The proceedings opened on October 12th with an address by Mr. Winston Churchill (President of the Board of Trade), after which the conference settled down to business under the presidency of Lord Rayleigh. At the same meeting the unit of resistance was dealt with, and the following resolutions were passed:—

The Conference agrees that, as hertofore, the magnitudes of the fundamental electric units shall be determined on the electro-magnetic system of measurement, with reference to the centimetre as the unit of length, the gramme as the unit of mass, and the second as the unit of time.

These fundamental units are (1) the Ohm, the unit of electric resistance which has the value of 1,000,000,000 in terms of the centimetre and second; (2) the Ampere, the unit of electric current, which has the value of one-tenth (0·1) in terms of the centimetre, gramme, and second; (3) the Volt, the unit of electromotive force, which has the value 100,000,000 in terms of the centimetre, the gramme, and the second.

The International Ohm shall be defined as the resistance of a specified column of mercury.

The International Ohm is the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice, 14·4521 grammes in mass, of a constant cross-sectional area, and of a length of 106·300 centimetres. To determine the resistance of a column of mercury in terms of the International Ohm, the procedure to be followed shall be that set out in Specification A attached to these resolutions. [This latter specification was given in full in our last issue.]

The specification of the mercury standard ohm was further discussed by the Technical Committee on Tuesday, October 13th.

The second meeting of the Conference, on Wednesday, October 14th, was devoted to the question whether the ampere or the volt is to be the second primary unit. The motion:—

That the ampere is the second primary unit

was eventually carried, after an amendment of M. Lippmann (France) to the effect that the volt should be the second primary unit had been discussed at some length. M. Lippmann considered that the volt was independent, and could be measured absolutely by means of a disc rotating in the earth's magnetic field. This amendment was supported by Dr. Cahart (America). This discussion centred largely on the relative merits of the silver voltameter and various standard cells which would be used as practical standards. The following resolution was then moved:—

The International Ampere is the unvarying electric current which when passed through a solution of nitrate of silver in water, in accordance with the specification attached to these resolutions, deposits silver at the rate of 0·00111800 of a gramme per second.

M. Lippmann again dissented, and moved that the international ampere should be defined as 1/10 of the electromagnetic unit on the C.G.S. system. This amendment was also supported by Dr. Cahart, and was eventually lost. The original motion was then carried subject to the exact figure for the electrochemical equivalent of silver being referred to the Committee. The final resolution:—

The International Volt is the electrical pressure which, when steadily applied to a conductor whose resistance is one Inter-

Digitized by Google

national Ohm, will produce a current of one International Ampere,

was then carried unanimously, but a note on the Weston cell was referred to the Committee.

The Technical Committee met on Wednesday afternoon and discussed the exact figure to be taken for the electrochemical equivalent of silver at some length, but no decision was arrived at, and the matter was referred to a sub-committee. The next day's meeting of the committee (Thursday morning) was devoted to the consideration of matters of detail regarding the methods to be adopted in standardising laboratories to realise the International ohm and ampere, and to set up the Weston normal cell. A lively discussion ensued as to the last two figures for the electrochemical equivalent of silver.

On Thursday evening the delegates were entertained by the Government at a dinner at the Ritz Hotel, Piccadilly. The chair was occupied by Mr. Winston Churchill, and the company, numbering about 120, included a number of distinguished visitors.

Mr. WINSTON CHURCHILL, in proposing the toast of the delegates, remarked on the practical nature of the object which had brought them together, and urged the importance of unity in matters relating to electrical standards. Of all the sciences that minister to the practical needs of mankind, none, he thought, had more gifts to bestow than the science of electricity. In conclusion, he expressed in the name of his Majesty's Government the heartiest welcome to the delegates, and trusted that their work would be crowned with success, and would not only help to ensure unity in the sphere of electrical standards, but also amongst the nations of the world.

Prof. LIPPMANN, responding on behalf of the delegates, said that Great Britain had been the first country to establish a complete and coherent system of electrical measurement, and paid high tribute to the work of Lord Rayleigh, the British Association, and the Board of Trade. The question of the unity in the electrical standards was a most pressing one; he was glad that an opportunity had been given for settling the matter, and trusted that the labours of the Congress would be fruitful in that direction.

Dr. WARBURG (President of the Reichsanstalt), in responding, said that although at one time the difference between the English and the German ohm amounted to as much as 6 per cent., the differences were now very small indeed. The results of the Congress would, he hoped, eliminate even these small differences, and also enable countries which had no national laboratory to acquire standards for their own use. In conclusion, he expressed the gratitude of the delegates for the assistance given them by the British Government.

Dr. STRATTON (Director of the American Bureau of Standards) remarked that it was most encouraging to see the splendid work that was being done at the National Physical Laboratory, and expressed the opinion that the benefits derived from that and similar institutions fully warranted the expenditure on them. It was, he said, a pleasing sign of the times, that the Governments of the different nations were taking an increasing interest in scientific work.

Lord RAYLEIGH (President of the Royal Society) proposed the health of the Chairman, and spoke of the value of such congresses as the present one. He remarked that controversies as to methods in scientific work seldom arose, and that it was not often that the glow of fight illumined the spirits of scientific workers.

Mr. WINSTON CHURCHILL, in responding, said that he felt it a great honour to address such a company on behalf of the Government, and trusted that their labours would be fruitful and permanent.

On Friday morning the Technical Committee issued the following interim report:—

That the Technical Committee be authorised to issue as an appendix to the report notes detailing the methods which have been adopted in the standardising laboratories of the various countries to realise the International Ohm and the International Ampere and to set up the Weston Normal Cell. The Technical Committee recommend the Conference *not* to alter the length of the Mercury Column in the definition of the International Ohm from 106·300 cm. to one metre. The Technical Committee recommend that the wording of Resolution VI. be altered to read:—The International Ampere is the unvarying electric current which, when passed through a solution of nitrate of silver in water, in accordance with the specification attached to these resolutions, deposits silver at the rate of 0·001118 of a gramme per second. The Technical Committee recommend that there be added to the specification for the silver voltameter the following paragraph:—"That for purposes in which it is desired to use the International Ampere to a higher degree of precision than that given in the definition; the figures which follow the '8' in 0·001118 shall be considered as . . ." On a vote being taken as to the figures left blank above, the votes were: Eight delegates in favour of "20," five delegates in favour of "00," and one abstention (the chairman not voting).

The third meeting of the full Conference was held on Friday. The interim report of the committee given above was considered, and, on the motion of Dr. Glazebrook, it was resolved:—

"That the Technical Committee be authorised to issue as an appendix to the report notes detailing the methods which have been adopted in the standardising laboratories of the various countries to realise the international ohm, and the international ampere, and to set up the Weston normal cell."

The recommendation of the Technical Committee regarding the length of the mercury column in the standard ohm was then confirmed, and the conference proceeded to discuss the vexed question of the last two significant figures in the electrochemical equivalent of silver, and eventually it was decided by 21 votes to three to confirm the resolution with the figure 0·00111800, for the amount of silver deposited by one ampere in one second. Some suggested modifications in the wording of other resolutions were then dealt with, and the addition of the following words to the second paragraph of the resolution given on p. 564:—

"As a system of units representing the above, and sufficiently near to them to be adopted for the purpose of electrical measurements and as a basis for legislation, the Conference recommends the adoption of the international ohm, the international ampere, and the international volt defined according to the following definitions."

The additional resolution:—

"That the ohm is the first primary unit,"

was then passed, and the conference proceeded to consider the steps necessary to secure uniformity of the standards in future.

With regard to the proposed appointment of a permanent Commission the following resolution, moved by Dr. Warburg, was carried:—

"That the Conference approves generally the draft scheme to establish a permanent Commission to secure uniformity of administration in relation to electrical units and standards in the future. The Conference refers the draft scheme to the Technical Committee to consider details and to nominate the first members of the Commission."

The main questions at issue were whether, in view of the existence of the International Electrotechnical Commission (which met in London on Monday, see page 575), a separate permanent body was needed, and whether it was practicable to extend the functions of the Bureau International des Pois et Mésures to include electrical standards. These points were discussed at the meeting of the Technical Committee on Monday, and a draft scheme was prepared to be submitted to the final meeting of the Conference yesterday. A further meeting of the Technical Committee was held on Tuesday, at which a resolution was passed defining the watt, the unit of power, as having the value 10,000,000, in terms of the centimetre, the gramme, and the second.

The final report of the committee, which was discussed at yesterday's meeting of the Conference, will be given in our next issue.

The programme of visits and entertainments attended by the delegates was given in our last issue. On the occasion of the visit to Cambridge on Saturday, the degree of Doctor of Science *honoris causa* was conferred at a special congregation upon Dr. S. A. Arrhenius, Prof. G. Lippmann, Mr. S. W. Stratton, and Prof. E. Warburg.

LONDON ELECTRIC POWER BILLS

IN the House of Commons on Monday night, the London and District Electricity Supply Bill was considered in relation to a motion by Mr. Winston Churchill, the President of the Board of Trade, "That it be an instruction to the Committee to insert in the Bill a provision conferring purchasing powers on the London County Council." The Bill, it will be remembered, was read a second time in July.

Mr. Hudson Kearley, Parliamentary Under-Secretary to the Board of Trade, who moved the instruction, said that although the promoters had successfully resisted the insertion of such a provision in the House of Lords, they had now accepted it, knowing that it was on no other terms that the Government would support the Bill.

Mr. J. Rowland (Dartford) moved an amendment striking out the words "the London County Council," and substituting "a central authority composed of representatives of the municipal authorities owning their electrical supplies within the area covered by the Bill." He reminded the House that although the London County Council was to be named as the purchasing authority, yet the Bill took in areas of 51,947 acres in Essex, with a population of 703,696; 32,414 acres in Kent, with a population of 214,563; 25,232 acres in Surrey, with a population of 286,521; and 52,671 acres in Middlesex, with a population of 600,168. Therefore he asked for representation on the purchasing authority on behalf of these outside districts.

Mr. R. Whitehead (S.E. Essex) supported the amendment.

Sir John Benn (Devonport), in supporting the instruction, said that this Bill had been represented as an attempt to fasten a great monopoly on London, but in reality there already existed a monopoly at the hands of the local authorities and companies. Several committees of Parliament had declared that the London County Council was the proper purchasing authority, and both parties on that body were at present united in this opinion.

Mr. G. H. Radford (East Islington), whilst accepting the instruction, wished that it had gone further and dealt with the purchase clause, which he entirely objected to in its present form.

Sir E. Cornwall also supported the instruction.

Mr. Bonar Law (Dulwich) wished it to be left to the discretion of Parliament to select the purchasing authority, when the period for purchase arrived. He favoured representation on the purchasing authority of the outside districts for the reason that it appeared likely the company would develop its business mainly outside London owing to the inside being so well supplied at the present time, and therefore it would be possible under the instruction that the area which formed the most important portion of the company's business would be without a voice when the time for purchase came round. He therefore asked that the words "or some other body to be appointed by Parliament" should be inserted in the instruction.

Mr. W. H. Dickinson (St. Pancras) said that he and those in agreement with him had come to the conclusion that this Bill did not constitute a great monopoly. The provisions of the Bill had been greatly misrepresented, although there were clauses in it which would have to undergo modification at the hands of a Committee. He was convinced that such a scheme was the only solution of the problem in London, and as the London County Council refused to deal with the matter, it met his approval if the County Council were constituted the purchasing authority.

Mr. W. Guinness (Bury St. Edmunds) preferred the suggestion of Mr. Bonar Law, but failing that, expressed his intention of voting for the instruction.

Mr. Churchill said that the Government were seeking by this instruction to indicate a general policy in the future. They were seeking to affirm a principle which would certainly govern these Bills so far as they might progress, and which might govern other Bills if these Bills should not reach maturity. This principle was that ultimately, and he hoped as soon as possible, there should be one combined, extensive, uniform system of electrical supply for the metropolitan area under the control of the government of London. The amendment proposed by Mr. Rowland would exclude nearly half the districts concerned from any share in his proposed representation, for it would only include representatives of the municipal authorities owning electricity works within the area of the Bill. There were 77 local authorities within the area, and of these 35 did not own electrical undertakings. A purchasing authority composed in this way would be less representative, less responsible, and less competent than the London County Council. This new body would have no rating power; a special statute would be required to effect the purchase, and even if all the difficulties were surmounted, a body would be created that would be but a bad imitation of the Water Board.

Mr. J. Ward (Stoke-on-Trent), having supported the amendment proposed by Mr. Rowland, a division was taken on this, with the result that there was a majority of 88 against it.

Mr. T. Lough (West Islington), continuing the discussion against the instruction, regretted that the Government had interfered. He wanted some definite instruction to the Committee with regard to the purchase clause, which should stipulate tramway terms, under which nothing could be paid to the company for goodwill.

Mr. Churchill said he desired to press upon the House the desirability of careful and impartial consideration of the proposal by a Committee of the House. The instruction did not prevent that; any other course would be improper and disrespectful, more especially in a year when unemployment had reached its maximum, and the private enterprise its minimum. The Government, however, did not recommend the merits of the Bill; in fact, he admitted there were objectionable clauses. Clause 77, for instance [power to transfer undertakings to the company] was objectionable. Every clause of this kind had been objected to by the Board of Trade, and he was prepared to give a pledge that if the clause appeared in the Bill when it came back to the House, he would not only not support it, but would counsel the House to reject the Bill. But there were all questions for the Committee, and the House and the Government would be perfectly free to take their own course on third reading. For his own part, he was reserving his opinion, as the Government was theirs, until they had the report of a Committee as to how far the clauses of the Bill were reconcilable with the public interest.

A division for the closure of the debate was carried by a majority of only nine, but there was a majority of 133 in favour of the instruction to the Committee to insert the name of the London County Council as the purchasing authority.

NATIONAL TELEPHONE COMPANY'S EMPLOYEES

A NUMBER of questions were asked in the House of Commons on Monday as to whether the National Telephone Co. has suspended all new constructional work owing to the approaching acquisition of the telephone service by the Government. It was alleged that in consequence there had been, or would be, dismissals of telephone employees before 1911, amounting to about 6,000, a figure which was attributed to the President of the National Telephone Co. It was asked whether some means could be devised by which the capital expenditure of the company could be controlled by the Government during the few remaining years of the company's existence.

Mr. Sydney Buxton, the Postmaster-General, in reply, stated that it was not a fact that the National Telephone Co. had suspended their construction work, but they had stated that it would not be to their interest to undertake the construction of new plant, which would not be likely to be brought into use before the end of their licence, and, in consequence, they would find it necessary to make some reductions in their construction staff. The question of providing for the development of the telephone system had received careful consideration, and under an arrangement come to in the purchase agreement of 1905, a good deal of work was being undertaken by the Post Office and leased to the company until 1911. This policy, which was being pursued as actively as possible, would to some extent meet the difficulty, but the Postmaster-General added that he was discussing with the company what further arrangements could be made, so that the necessary work of construction could be continued without interruption. The company had further informed him that the discharges which had so far taken place, apart from those due to misconduct or incompetence, had been mainly caused by an exceptional falling off in orders consequent upon the recent depression of business throughout the United Kingdom. Arrangements were being made, however, to give employment in the Post Office service to competent workmen discharged from the company's service, when this was possible.

A statement has been issued by the Central Committee of the National Telephone Staff Transfer Association, as to the position of the staff on the transfer of the National Telephone Co.'s system to the Post Office in 1911. They point out that very shortly the company's spare plant will, speaking generally, be sufficient to meet the demand to the date of purchase, and that this means that construction work will stop at a very early date. As the construction work ceases, they say, the company's construction staff and others, together numbering about 6,000, will become superfluous, and will be paid off. The committee insist that the extra plant which it is necessary should be constructed is so essentially a part of the system as a whole that the work should be done by one party, and suggest that a joint purse arrangement should be come to between the Post Office and the company, whereby the constructive work can be continued, the cost being allocated between the parties in proportion as they will respectively benefit from its use.

Telegraph Traffic.—The only repair we have to notify is that of communication with Bankok, which took place on the 15th inst. The German cable manufacturers are now busy making the cable destined to connect their country with Brazil. Telegraphic connection between Mole St. Nicholas and Cape Haiti has also been restored. The Sitia-Rhodes and Pontianak-Saigon cables have still to be repaired.

THE MANCHESTER ELECTRICAL EXHIBITION

THE popularity of the Electrical Exhibition at Manchester still continues, and on Saturday last a record gate was recorded; approximately 25,000 people passed through the turnstiles. As during the previous week, it was necessary to close the park gates now and then in order to relieve the crush at the turnstiles, but no difficulty was met in managing the crowd.

Up to date the following Local Authorities have sent deputations to visit the Exhibition:—Hull, Blackburn, Stockton, Croydon, Blackpool, Macclesfield, Birkenhead, Malvern, Wallasey, Bray, Keighley, Chesterfield, Derby, Ramsbottom, Heywood, Mortlake, Glasgow, Bristol, Whitehaven, Stepney, Newport (Mon.), Dublin, Oldham, Ipswich, Darlington, Swindon, Leek, Blackpool, Bury, Cheltenham, Manchester Corporation Tramways, and Bolton.

In addition to this, the Incorporated Municipal Electrical Association held its Council Meeting there last week, and there was also an official visit by the Electrical Contractors' Association, a report of which appears on page 564 of this issue. In our fourth Exhibition Supplement this week we publish further descriptions of the exhibits, illustrated with a large number of views of apparatus and some special drawings.

A persistent rumour was circulated at the Exhibition last week that a proposal was on foot to keep the Exhibition open until November 14th instead of closing it on October 31st, as arranged originally. There was no authority for this report, and, as a matter of fact, the majority of the exhibitors are quite satisfied that the period of one month is sufficient.

LOCAL NOTES

ABERDEEN: *Inauguration of New Plant.*—The new high tension system for supplying the Cults district was inaugurated last week. Powers to supply in this district were obtained in a Special Act in 1907. Two 100-kw. 6,600-volt alternators have been installed in the Ferryhill power station, which will supply a sub-station in Cults, which was formerly used as a steam generating plant by the Deeside and District Electricity Supply Co., now taken over by the Corporation. The converting machinery has been supplied by the Brush Co., the switchboard by Messrs. Ferranti, Ltd., and the cables by the British Insulated & Helsby Cables, Ltd., the total cost of the scheme being about £7,000. The distance from Ferryhill to Cults is seven miles.

AYR: *Extension of Electricity Area.* -The Ayr District Committee approved of an agreement with the Ayr Corporation for an extension of the electric lighting area of the latter to include the district of Alloway. No wayleaves are to be charged, and the consumers in the Alloway area are to be supplied with light on the same terms as those within the burgh.

Electricity Reserve Fund.—The following letter has been received by the Council from the Scottish office:—"With reference to your letter of the 8th instant and previous correspondence, in which you apply for authority to borrow an additional sum of £30,000 for electricity purposes, I am directed by the Secretary for Scotland to state that he consents to the borrowing by the Council of a further sum of £20,000 for the execution of capital works under the Ayr Electric Lighting Order, 1890, raising the total sum authorised for that purpose to £120,000. I am to add that the Secretary for Scotland regrets his inability, in the absence of a reserve fund, to authorise at present the borrowing of a larger amount for the service of the electricity undertaking, and I am to suggest that the Town Council should further examine this matter in connection with the question raised as to the charge made for current supplied to the Corporation tramways, which, on the information before him, appears to be inadequate."

BARGOED: *Death from Electric Shock.*—Whilst a workman was attending to one of the cables in the South Pit, Bargoed, last week, he accidentally came into contact with a live wire and was killed.

BARNSTAPLE: *Public Lighting Charges.*—A resolution was proposed at the last meeting of the Corporation to the effect that the charge for public lighting shall not exceed the rate charged to other large consumers for lighting purposes, and that the committee be requested to draw up a system of charges in conformity with this resolution. In support, it was mentioned that whilst large consumers were only charged 2¾d. per unit, the largest consumer of all, viz., public lighting, was charged 4½d. and 5d. per unit. As only the proposer and seconder voted for the resolution, no action is to be taken

BELFAST: *Home Office Regulations.*—The question of the payment of the Corporation's contribution towards the cost of opposing the proposed Home Office electrical regulations has been referred to the Electrical Engineer and the City Accountant. At the conference of local authorities which dealt with the basis of payment, the proportion to each authority was to be based upon the gross annual revenue, whereas the Corporation has passed a resolution that it should be upon the basis of capital expenditure.

BRADFORD: *Tramways Renewals.*—At the last meeting of the Corporation it was stated that during the present financial year there had been expended upon renewals of the permanent way about £22,000 up to date. For the years ending March, 1910 and 1911, it was estimated that there would be required for renewals the sums of £22,000 and £17,000 respectively, and if a similar balance to that of last year was carried to the fund each year (£17,000), the amount to credit at 1910 and 1911 would be £42,000, or less by £10,000 than at the end of last financial year.

Technical College Laboratory.—In the report of the Bradford Technical College for the session 1907–8, regret is expressed that nothing has yet been done to remove two defects which have been alluded to on several occasions in the annual report, and the continual existence of which places the engineering department at an increasing disadvantage year by year, namely, the absence of an adequate equipment in the power production and electrical engineering section.

BRAY: *Resignation of Chairman of Lighting Committee.*—The Chairman of the Electric Lighting Committee, who recently resigned on account of the small amount of interest taken in the undertaking by the other members of the Corporation, has refused to reconsider the matter.

DOUGLAS (I.O.M.): *Underground Telephone Wires.*—The Council has granted permission to the National Telephone Co. to lay its wires underground, the company paying one shilling per circuit connected to the exchange, with a minimum of £25 per annum.

EDINBURGH: *Public Lighting.*—A return as to the public lighting of Edinburgh states that at May 15th, 1908, the streets of the city were lighted by 10,081 incandescent gas lamps and 1,193 electric arc lamps, and the common stairs by 12,395 gas jets and 152 electric lights. The number of electric arc lamps had been increased by 18. The additional arc lamps had been required to light up tramway extensions in Colinton and Gorgie Roads. The number of stair lights had gone up by 272, the previous year's total being 12,123. This increase was easily accounted for, being due in part to the erection of new buildings, but mainly to the demand for improved lighting. The expenditure was—For street gas lighting (including cost of gas, with due proportion of lamplighters' wages, and incidental expenses), £22,549; for electric lighting (including incidental expenses), £11,246; and for stair lighting (including gas, proportion of wages, and other expenses), £11,619. This showed an increase of £1,814 compared with the previous year. At May last the 1,193 electric arc lamps cost £9 per lamp.

ENFIELD: *Tramways.*—In view of the delay which has taken place in the completion of the Middlesex County Council tramways from Ponders End to Enfield, owing to disagreements with frontagers, it was rumoured that the County Council intended to abandon the line in question, which will afford a valuable cross connection, linking up two of the Middlesex main roads. The Chairman of the Light Railways Committee, however, states that this is not so, and that the line will be proceeded with as soon as possible.

GLASGOW: *Tramway Receipts.*—Since the beginning of the financial year on June 1st, 80,232,777 passengers have been carried, as against 81,767,499 in the corresponding period of last year, while the receipts have been £327,762, in comparison with £332,587.

GRASSINGTON: *Electric Lighting.* A local company is being formed to provide an electric lighting installation.

Digitized by Google

HARROGATE.—*Cottage Lighting.*—The Lighting Committee report having reconsidered the question of the lighting of small properties, especially dwelling-houses, at a fixed charge per quarter, and recommend that a charge of 2s. 9d. per quarter for every 30-watt lamp be made, subject to the following conditions: (1) The amounts to be paid quarterly in advance; (2) all departments fitted with light under this tariff are to be adequately lighted by windows during daylight; and (3) the minimum number of lamps per tenement to be two and the maximum six. The Corporation has adopted the proposal.

KEIGHLEY: *New Tramways.*—An application is to be made to the Board of Trade for a Provisional Order authorising the construction of five new tramway routes.

KETTERING: *New Generating Plant.*—A new 500-kw. continuous-current generating plant and an extension to the switchboard was put into operation last week. Messrs. Allen, Son & Co., of Bedford, have supplied the engine, The Phœnix Dynamo Co., of Bradford, the dynamo, and Messrs. Cox-Walkers, of Darlington, the switchboard extension.

LEEDS: *Guiseley Tramways.*—Notices have been served upon the Horsforth, Rawdon, Yeadon, and Guiseley Councils, and also upon the property owners concerned, with regard to the construction of the tramways to Guiseley. Parliamentary powers were obtained last session, the length of line being about four miles. The Councils mentioned above have agreed to contribute £400 per annum for eleven years.

Tramway Receipts.—The half-yearly statement and balance-sheet to September 30th shows a total revenue during the six months of £180,225, against £176,698 in the corresponding half-year of 1907. The average receipts per car mile were 10·93d., against 10·95d. The expenditure amounted to £89,229, against £86,671. The net revenue account stands for £90,996, against £90,026. Allowing for capital charges, &c., there is an available balance of £30,096, against £34,999.

Tramway Accident.—A section of the Leeds Corporation tramway service was seriously disorganised on Thursday last week owing to the slipper brake of a car having dropped and become wedged between the points and the rail. It took two hours to remove the obstruction.

LIVERPOOL: *New Tramways.*—A proposal is before the City Council that an application be made to the Board of Trade for a Provisional Order for the construction of several tramway extensions.

Year's Work of Electricity and Tramways Committee.—In acknowledging a vote of thanks for his services as Chairman of the Electricity and Tramways Committee during the past year, Sir Charles Petrie said that the sales for the past twelve months for power purposes had increased by 13 per cent., and the total number of consumers connected to the mains was 7,000. During the current year they had contributed £27,500 to the relief of rates, and, *à propos* of the recent agitation for reduced prices, he said that there was no reason why charges should not be reduced, but the sum in relief of rates could not be maintained. A new sub-station has been erected in Beaumaris Street for the supply to the north end of the city. With regard to tramways, in addition to the introduction of first-class cars, all the ordinary cars have been fitted with top decks, all the cars have been fitted with improved sand hoppers, and 100 cars have been equipped with new running gear.

Local Electrical Association.—The opening meeting of the Liverpool and District Electrical Association was held last week, when the President, Mr. H. E. O'Brien, delivered his address upon electric traction, and dealt with track equipment, switchboard control, rolling-stock, and overhead lines, and concluded with a comparison between steam and electric train work.

Tramway Receipts.—During the nine months ended September 30th, the passengers carried upon the Corporation tramways amounted to 91,540,688, and the receipts £421,813, whilst the mileage run was 9,266,521. Since the tramways were taken over from the late tramway company on September 1st, 1897, the sum of £182,657 has been paid in contributions to rates, in addition to £974,818 in capital charges, whilst the concessions to employees in increased wages, holidays, and uniforms, &c., are calculated to reach the sum of £550,000. The public were also estimated to have gained £3,300,000 in reduction of fares.

LONDON: *City of London: Street Lighting.*—At a meeting of the City of London Corporation on October 15th a recommendation of the Streets Committee that authority be granted them to appoint a deputation to visit certain cities on the Continent for the purpose of inspecting public lighting systems was adopted. The cost of the visit is not to exceed £200.

London County Council Tramways.—The total traffic receipts upon the London County Council tramway system from April 1st to October 10th were £818,633 from lines worked by electric traction, and £161,792 from lines worked by horse traction, or a total of £980,425. The receipts for the corresponding period in 1907, under the same heads were £641,311, £230,036, and £871,347 respectively.

In the House of Commons on Monday, Mr. B. S. Straus asked the President of the Board of Trade whether a new license would be issued to the London County Council to continue to work the G.B. surface contact system from Aldgate to Bow, as the present license would shortly expire. Mr. Straus also asked whether the President of the Board of Trade was aware that an expert report had stated that, even had the line been constructed exactly similar to the one at Lincoln, the difficulties and dangers which had been encountered would have been much the same. Mr. Churchill stated that no application had been made for the renewal of the present provisional license, and that he had no information with regard to the latter part of the question.

The fee for Mr. W. M. Mordey's services, in connection with the report on the "G. B." surface contact system in the Mile End Road, has been agreed at 250 guineas, and at yesterday's meeting of the Council an emergency estimate of £350 was submitted to cover this and other incidental costs.

The Highways Committee have reported with regard to the construction and reconstruction of further tramways in St. Pancras, Woolwich, Kentish Town Road, Streatham, Clerkenwell, and Islington, at an estimated capital expenditure of £281,265, of which £253,950 is for trackwork, and £27,315 for cables, ducts, overhead equipment, &c. With the exception of one line, namely, that in Streatham, to connect up with the Croydon tramways at Norbury, which is partly conduit and partly overhead, all the lines will be constructed on the conduit system. The "G. B." surface contact system was originally proposed for one of the routes, namely, from Euston Road, via Hampstead Road, Camden Road, and Parkhurst Road, to Holloway Road, but after fully weighing all the circumstances, the Committee now recommend the conduit system. The extra cost entailed amounts to about £53,000. The report has been adopted.

Battersea Tramways.—The Borough Council has consented to the electrification of the tramway on Lavender Hill and St. John's Hill, subject to satisfactory conditions being arranged. The matter has been referred to a departmental committee to report thereon.

Kensington: Opposition to Tramways.—Mr. R. A. Robinson has written acknowledging receipt of a communication addressed to him by the Town Clerk, expressing the hope that he would do all in his power to secure the rejection of the proposal of the Highways Committee to construct a tramway from Battersea Bridge to Shepherd's Bush. Mr. Robinson says that he is opposed to the scheme put forward by the Highways Committee, and that he has no doubt the strong opposition which the same has evoked will secure its abandonment.

Islington: Tramways.—The Works Committee recommend that the London County Council's proposal to construct a single line of tramway from Essex Road via Englefield Road to Kingsland, be disapproved. They suggest that the necessary widenings to permit of the construction of a double line should be carried out as a county improvement.

REDDITCH: *Electrical Undertaking.*—The estimates for the ensuing half-year show that £500 will be required from the rates in support of the electrical undertaking. The loss of several large consumers and the increased cost of fuel during the past half-year are the reasons given by the Chairman of the Electricity Committee for this condition of affairs.

ST. HELENS: *Financial Position of Tramways.*—In the elective auditors' report upon the various undertakings of the Corporation, lengthy reference is made to the tramways undertaking. On March 31st, 1903, the accounts showed a balance of £3,392 7s. 11d., which in the period of five years had been absorbed, and at March 31st, 1907, there was a net deficit of £828 3s., whilst at March 31st, 1908, there was a total deficit of £908 6s. 8d., notwithstanding the fact that £1,230 has been paid into this account during the year as a contribution from the highway account. The only possible remedy, in the elective auditor's opinion, by which the Council can alter this serious condition of affairs is by making arrangements for taking over the trams and working them as a municipal undertaking. He was convinced that if they must be burdened with a rate—and he saw no way of escape—it would be much more satisfactory to the ratepayers to pay rates for something that would be under the control of the Council, and with the power to offer better facilities to the people, than to have to pay rates to maintain a track for a private company. Another point to which attention is called is the fact that the tramway accounts contain no depreciation fund.

SOUTHAMPTON: *Electric Omnibuses.*—A London company has applied for permission to run a service of electric omnibuses, but the Watch Committee recommend that the proposal should not be entertained.

SOUTHPORT: *Inspection of Electrical Machinery.*—The minutes of the Electrical Committee last week contained a resolution that the Vice-Chairman and the Electrical Engineer should be empowered to visit various towns for the purpose of inspecting the latest types of electrical machinery and apparatus with a view to further extensions. On account of the lateness of the municipal year, this recommendation was deleted.

SWANSEA: *Telephone Accounts.*—The balance in hand, from the sale of the telephone undertaking to the National Telephone Co., after meeting all liabilities and paying off debenture bonds of £23,000, represents a surplus of £927 18s., which has been transferred to the common fund in reduction of the rates.

Digitized by Google

Electricity Accounts.—The auditors' report upon the accounts of the municipal electricity undertaking states that the accounts, after providing interest on loans and sinking fund amounting to £8,950, shows a net profit for the year of £1,230, which, after deducting the adverse balance brought forward the previous year of £441, leaves a net credit balance of £789 as undivided profit. The capital expenditure continues to be added to. In 1906 the additions amounted to £9.852; in 1907, £11.895; and last year, £7,323, bringing the aggregate spent to the enormous total of £144,516, about one-third of which has to be repaid in 25 years, and the remaining two-thirds in 30 years. The auditors state that they can only reiterate in the strongest possible terms as to some check to this growing expenditure, and upon the absence of provision for depreciation. It is the practice in the leading towns carrying on electricity stations to make ample provision in this respect. Such items as measuring tapes, hammers, pliers, files, and other sundries, including Osram lamps, are capitalised, whilst it is a general practice to place to the same account such delicate things as motors and meters at prime cost without writing off a single penny for wear and tear. The total expenditure is divided as follows:—Buildings, £22,963; machinery, £45,062; mains, £50.069; motors and meters, £12,516; electrical instruments, £2.574; public lamps, £2.960; accumulators, £1,777; engineer's commission, £3,384; general expenses, £2,706. The sinking fund extends about 24 years. The report continues:—"Can the life of any of the above, except buildings, by any possible stretch of imagination, last beyond half this time? And if this be true another loan will have to be applied for. The growing tendency of municipalities to pile up huge amounts of capital expenditure may be a tempting one to present-day administrators, but as a sound principle of finance each generation should meet its own liabilities. This department has been in existence for seven years, yet the net result of trading shows a surplus of £789 only, without one penny provided for reasonable wear and tear of machinery, boilers, &c."

TURKEY.—*Telephone Service.*—A *Financial News* telegram states that the Turkish Government has refused the offer of a German syndicate to establish a telephone service in Turkey. It is announced that international tenders will be invited, and the monopoly given to parties offering the most advantageous terms.

WARRINGTON: *Electric Supply Charges.*—A scale of discounts for consumers of electric light has been adopted, ranging from 1s. 2d. in the £ below 250 units per quarter, to 2s. 2d. between 109,000 and 12,149 units. The scale of discounts for consumers of power ranges from 1s. in the £ for units between 2,500 and 3,749 to 2s. 6d. for units between 205,000 and 234,999. These discounts are only allowed if the account is paid within a month. Councillor Wilkinson, at the last meeting of the Council, in moving the adoption of the minutes, said that in the past the charge for lighting was 4½d.—with discount 4d. The latter would now be 3¾d. They proposed to make a similar reduction for power. It would mean a loss of £500 on lighting, and £600 on power, but they hoped this would be the means of encouraging more people to use electricity both for lighting and power.

WESTON-SUPER-MARE: *Public Lighting.*—A letter from Mr. C. H. Godward (secretary to the Weston-super-Mare & District Electric Supply Co., Ltd.) with reference to the public lighting of Walliscote Road states that he had submitted to his board the draft agreement returned with various alterations and additions, and they desired him to say that they could not accept the agreement as amended. They further wished him to state that as it seemed impossible to come to an arrangement with the Council on the basis of the altered draft agreement, they had no alternative but to withdraw the proposal put forward by their managing engineer. If, however, it would assist the Council out of their difficulty regarding the lighting of Walliscote Road, his board would be willing to supply current at a flat rate of 1½d. per unit for any lamps that Council might desire lighted. The Gas Co. is to be asked for terms for the lighting of Walliscote Road.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

CLITHEROE.—A proposal is under consideration for the erection of electricity works in connection with the gas works.

EPSOM.—Tenders are invited for a storage battery. Particulars from the Electrical Engineer, and tenders by October 23rd.

MAIDSTONE.—The sanction of the Local Government Board has been received to the borrowing of £18,400 in connection with the electric lighting undertaking.

MANCHESTER.—The Electricity Committee invite tenders for the supply, delivery, and erection of high-pressure steam and feed pipes, valves, and supports at their Stuart Street generating station (see an advertisement this week).

SIERRA LEONE (W. Africa).—An electric lighting scheme is under consideration. Messrs. Wilkinson & Broadbent, 4 Queen Street Place, London, E.C., are the consulting engineers to the Council.

SOUTH AFRICA: *Germiston.*—The Council invite tenders for a supply of electrical energy in bulk. Tenders should state: (*a*) The price per unit at which they would be prepared to supply 700.000 (Seven Hundred Thousand) units approximately per annum; (i.) for a period of five years; (ii.) for a further period of five years—the right of exercising the extension for this further period of five years to rest with the Council. The current to be three-phase alternating 50 or 60 cycles and 3,300 volts between lines; to be delivered at a point selected by the Council convenient to the boundary of the township. The load is mixed lighting and power, chiefly power, with a peak load of 350 kw. (*b*) The date on which they would be prepared to supply the current. Tenders to the Town Clerk, Germiston, Transvaal, South Africa, by Thursday, December 18th.

Miscellaneous

AYR.—Tramway extensions are under consideration.

DUNDEE.—The Harbour Trustees invite tenders for 25 tons of steel rails, tramway section, about 127 lb. per yard, with fishplates and bolts. Tenders to the Engineer by October 22nd.

JAPAN.—It is stated that the Keihin Electric Co. has practically succeeded in obtaining from London capitalists a loan of 2,000,000 yen (£200,000) for the purpose of extending its line from the Aoyama terminus of the Tokyo Railway to Shingawa.

LONDON: *London County Council.*—Tenders are invited for the supply of the following stores for one year from January 1st, 1909:—(*a*) Electric carbons and brushes; (*b*) electric fittings, globes and shades; (*c*) electric insulating materials; (*d*) electric cables and wires; (*e*) electric lamps.

LOWESTOFT.—The Local Government Board has sanctioned the borrowing of £661 for mechanical stokers.

SALFORD.—The Tramways Committee invites tenders for the supply and erection of a wheel-turning lathe and a vertical press at the Central Car Depôt, Pendleton Road. Particulars from the General Manager, and tenders to the Town Clerk by November 2nd.

STOCKPORT.—The Local Government Board has granted permission for borrowing £10.500 for the electricity undertaking.

WOLVERHAMPTON.—Extensions of the tramways have been authorised from Queen Square, along Victoria Street, Worcester Street, Penn Road, Lea Road, and Stubbs Road.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—Additions to Stour Wharf, Stour Road, Poplar, for Henry Thorman.

E.C.—Bank, restaurant, shops, and offices on sites of Nos. 21, 22, and 23 New Bridge Street. Architects, Palgrave & Co., 28 Victoria Street, S.W.

Building at 71 Old Broad Street. Architect, Joseph & Smithem, 83 Queen Street, E.C.

N.E.—Mission hall, Mabley Street, Hackney. Builder, James Watt, Bromley Road, Catford

S.E.—Thirty-one houses, Lewisham. Architects, Norfolk & Prior, 4 Station Buildings, Catford Bridge, S.E.

King's Hall Palace of Dancing, to be erected at junction of St. George's Market and Dantzic Street, Southwark. W. F. Hundall, 84 Blackfriars Road, S.E.

Clergy house and other parochial buildings, in King's Bench Walk and adjoining streets, Southwark. Rev. T. Gerard Tylee, vicar of St. Alphege, Southwark.

S.W.—Additions, &c., at St. John's Parochial Hall, Brixton.

Building, Pimlico Wharf, 145 Grosvenor Road, for Allen & Co., building contractors.

Building, 34 Queen Anne's Gate. Architects, Blow & Billery, 3 Pall Mall East, S.W.

W.—Rebuilding shops, showrooms, &c., 522 Oxford Street. Builders, Hall, Beddall & Co., Pitfield Wharf, Waterloo Bridge, S.E.

PROVINCES.

ACTON.—New schools (Local Government Board sanctioned the borrowing of £18,098).

Digitized by Google

New public offices (Local Government Board sanctioned the borrowing of £20,600). Wm. Hodson Clerk to the Urban District Council, Acton.

BURTON.—New police station and courts (£13,250). Architect, H. Beck, 30 High Street.

BLACKPOOL.—Carnegie Library (£15,000). Thomas Lofton, Town Clerk.

BIRMINGHAM.—Extensions to factory, Northwood Street, for Jones & Rooke.

Extensions to factory, Freeman Street, for Hassall & Singleton.

BOURNEMOUTH.—Rebuilding Railway Hotel, Holdenhurst and St. Paul's Roads, for H. C. Cartwright.

Alterations to Grosvenor Hotel, for A. R. Baker.

Additions to Castle Laundry, Castle Road, for R. Bevington.

Additions to St. Peter's Vicarage, Bath Road, for Rev. A. E. Daldy.

BRADFORD.—Conversion of two houses into club and dressing-rooms, and alterations and additions, Burlington Terrace, for Bradford City Football Club, Ltd.

BROMLEY.—Alterations to Lyric Theatre. Surveyor, F. J. Rorald, 72 Victoria Street, S.W.

BRENTWOOD.—Erection and completion of new central kitchen at Brentwood Asylum. F. Whitmore, County Architect, 73 Duke Street, Chelmsford.

CUMBERLAND.—Enlargement of schools at Oughterside (£1,297). C. B. Hodgson, Clerk to County Education Committee, Carlisle.

COLCHESTER.—County Lunatic Asylum (£191,545). Builders, Waring White Building Co., Ltd., 1A Cockspur Street, S.W.

EDINBURGH.—New cavalry barracks on estate of Redford, for War Office (£15,500). H. B. Measures, Director of Barrack Construction, Whitehall.

GARTH.—New Garth Institute. Architect, W. Beddoe Rees, Dumfries Place, Cardiff.

GLASGOW.—Langside District Library, Queen's Park, for Corporation. A. W. Myles, Town Clerk.

Alterations and additions to Dalmarnock Iron Works, Baltic Street, Bridgeton, for Sir Wm. Arrol & Co., Ltd.

Buildings at Aikenhead Road and Calder Street, for North British Locomotive Co., Ltd., Hydepark Works, Springburn.

HAMILTON.—School at Udston. Robert Kerr, Clerk to Parish School Board, Hamilton.

HANDSWORTH.—Alterations at William Street for Birmingham Railway Wagon Works.

ILFORD.—Alterations, Beehive School, Beehive Lane. Architect, C. J. Dawson, 11 Cranbrook Road, Ilford.

KING'S NORTON.—Infants' school (£4,173). E. Docker, Clerk to Urban District Council.

LEICESTER.—School (150 places) for Education Committee. E. V. Hiley, Town Clerk.

LOWESTOFT.—Additions to Isolation Hospital G. H. Hamby, Surveyor to Town Council.

Fitting up "Sparrows' Nest" for entertainments to be given by Town Council. G. H. Hamby, Surveyor to Town Council.

MANCHESTER.—Congregational Church House (£14,000). Architects, Bradshaw & Gass, 108 City Road, E.C.

NORWICH.—Alterations and additions to Norfolk and Norwich Hospital (£45,000). Hospital architect, E. T. Boardman.

NORTH FINCHLEY.—Roman Catholic Church, Nether Street (£5,000), to be lighted by electricity. Architects, Lamb & North.

NEWPORT (MON.).—New technical institute (£36,130) for Education Committee. Builder, W. E. Blake, Coxside, Sutton Road, and 23 Salisbury Road, Plymouth.

STRATFORD-ON-AVON.—103 Houses (£20,000). R. Dixon, surveyor to Town Council.

SOUTHAMPTON.—Sailors' Home. Architect, A. F. Gutteridge, 9 Portland Street; builder, W. E. Blake, Coxside, Sutton Road, and 23 Salisbury Road, Plymouth.

TEDDINGTON.—Shop and dairy, Kingston Road. Pyke Bros., cowkeepers, 37 High Street, Teddington.

WEST HARTLEPOOL.—Sawmill, Seaton Road, for J. W. Baird & Co.

WILLESDEN.—Boiler-house and chimney shaft, Leicester Road, for the White Heather Laundry. Surveyors, Mark W. King & Sons, 6 Holborn Viaduct, E.C.

Printing shed and boiler chamber, The Willows, Harlesden Road, for Thos. Illingworth & Co., Willesden Junction.

WEST RIDING (Yorkshire).—Secondary School at Castleford. F. A. Darwin, Clerk of County Council, Wakefield.

TENDERS RECEIVED AND ACCEPTED

ARGENTINE. The British Westinghouse Electric & Manufacturing Co., Ltd., of London and Manchester, have received an order from the Buenos Aires & Pacific Railway Co. for the complete construction and equipment of a large power station, with several sub-stations, for the supply of electricity to the city of Bahia Blanca. The contract also includes extensive additions to the existing tramway system within the city of Bahia Blanca and several outlying townships. The present contract had its origin in the taking over by the Buenos Aires & Pacific Railway Co. from a private enterprise of the supply of light and power to the city. The existing plant was found to be inadequate, and a scheme for extensions was projected by Mr. Packenham W. Beatty, the railway company's resident electrical engineer. The designs and specifications for the entire plant have been prepared by Mr. John F. C. Snell, the consulting electrical engineer to the Buenos Aires & Pacific Railway Co.

BRAY.—Two dozen meters are to be ordered from the General Electric Co. at 30s. each.

CLECKHEATON.—The tender of Messrs. W. T. Glover & Co. for 400 yards of cable has been accepted.

CORK.—For the lighting of various parishes in the Cork Rural District Council's area, the tender of the Cork Electric Light & Tramways Co. has been accepted.

GLASGOW.—The offer of the British Westinghouse Electric & Manufacturing Co., Ltd., to supply the two rotary converters, with transformers and spares, at a cost of £651, has been accepted.

HANLEY.—The tender of Messrs. Ferranti, Ltd., at £500 has been accepted for switchboard extensions.

LEEDS.—The Electromechanical Brake & Engineering Co. has been given an order for 70 magnets for brakes for the Corporation tramways.

LONDON: *London County Council.*—The tender of Messrs. J. Mowlem & Co. has been accepted at £68,602 for the execution of roadwork and plate-laying for the reconstruction of the existing tramways from Nine Elms to East Hill, Wandsworth. The following tenders were also received from the following:—Dick, Kerr & Co., £68,767; W. Manders, £70,097; J. G. White & Co., Ltd., £74,851.

The following tenders have been received for the supply of electric cable in connection with the tramways:—India Rubber, Gutta Percha & Telegraph Works Co. (accepted), £504 (less 2½ per cent.); W. T. Glover & Co., Ltd., £570 (less 5 per cent. and 2½ per cent.); Siemens Bros. & Co., £546 (less 2½ per cent.); Johnson & Phillips, £547 (less 2½ per cent. for cash monthly); W. T. Henley's Telegraph Works Co., Ltd., £541; Callender's Cable & Construction Co., Ltd., £542; British Insulated & Helsby Cables, Ltd., £551.

Hackney.—The Council has accepted the tender of W. Cory & Son, Ltd., for 4,000 tons of Cowdenbeath and Edinburgh washed pea nuts at 10s. 5d. per ton.

Stepney.—The Council has received the following tenders for the supply of twenty thousand pairs of carbons for new arc lamps:—Gilbert Arc Lamp Co., Ltd. (accepted), £101 6s. 8d; Sloan Electrical Co., Ltd., £137 10s.

For the supply of fifty tons of moulded pitch the Council has accepted the tender of J. Smart & Son, at £63 2s. 6d. The other quotations were:—Grindley & Co., Ltd., £75 alternative £81 5s.; South Metropolitan Gas Co., £77 10s.; Forbes Abbot & Leonard, Ltd., £80 12s. 6d.; Thomas Crow & Sons, £81 5s.

Stoke Newington.—The Council received the following tenders for cables to connect the new generating station with the sub-station in Edwards Lane:—Callenders Cable & Construction Co. £1,623; W. T. Glover & Co., Ltd., £1,556; British Insulated & Helsby Cables, Ltd., £1,413; W. T. Henley's Telegraph Works Co. (accepted), £1,371.

The following tenders were received for steam and other pipe work at the generating station:—Babcock & Wilcox, Ltd., £307; the Railway & General Engineering Co., £299; William Freer, £279; G. N. Haden & Sons, £275; Ashwell & Nesbit, Ltd., £268; John Spencer, Ltd. (accepted), £265.

SOUTHAMPTON.—The tender of Messrs. H. Stevens & Co. at £110 has been accepted by the Education Committee for improved lighting at the York Buildings Boys' School.

STOCKPORT.—An order has been placed with the General Electric Co. for exhaust piping and a battery meter.

WAKEFIELD.—The tender of the British Westinghouse Co. for three 60-kw. transformers at £156 has been accepted.

WEST HAM.—The Town Council received the following tenders for the supply and fixing of transformers, &c., at the Balaam Street Baths, to reduce the voltage to 25 volts to permit of the use of 10, 16, and 25 c.p. Osman lamps:—J. T. Halsey (accepted), £52 10s. 6d. (4); W. J. Woodward, £58 (1); W. Simmons, £60 16s. (4); Electricity Department, £71 15s. (1). Transformers, similar to above for effecting economy in the lighting of underground conveniences:—J. T. Halsey (accepted), £14 18s. 6d.; Vulcan Electric Co., £18 5s.; Electricity Department, £20 16s. 6d.

COMPANIES' MEETINGS AND REPORTS

AMERICAN TELEGRAPH & TELEPHONE CO.—The gross earnings for the nine months ended September 30th are $20,999,000, and after providing for interest on bonds and the October dividend there is a net surplus of $4,423,000, against $3,254,000 for the corresponding period of last year.

CLEVELAND & DURHAM ELECTRIC POWER.—At the second annual meeting, held in Newcastle last week, the report and accounts given in our issue for October 8th were adopted. Mr. Charles Emmott, who presided, said that, unfortunately, in common with nearly every other company in their district, their revenue had most seriously been affected by the strike in the shipbuilding industry, in addition to the severe trade depreciation. A large proportion of their revenue was obtained from shipyard and engineering works, which for many months had been practically idle and taking no current. Others upon whom they had expended capital and put themselves in a position to supply could not obtain the motors they had contracted for, the makers being unable to deliver them. They had consumers who had pressed them to be ready to supply in January last, but who, for various reasons, had not taken one single unit of energy. Other consumers affected by trade depression had reduced their demand by 50 per cent., whilst other firms, with whom they fully expected to complete agreements, had postponed the negotiations pending better times. Taking all the circumstances into consideration, the directors did not feel that the results for the year were very disappointing. Referring to the accounts, the chairman stated that at present every penny was needed in the company's business, and as, moreover, a portion of the profits for the year had been derived from work carried out by the associated companies, the board were unanimously of the opinion that they would be ill-advised to pay the final dividend on the preference shares. They preferred to strengthen the position by writing down preliminary expenses, a course which he believed the shareholders would approve. The net revenue for the year, after writing down preliminary expenses by £10,000, amounted to £5,142, in addition to £3,230 brought forward. After deducting an interim dividend of 5 per cent. upon the preference shares, which was paid in April last, there is a balance of £1,252, which is carried forward.

CUBAN SUBMARINE TELEGRAPH CO.—The report for the half-year to June 30th states that the total receipts for the six months amount to £18,079, the expenses being £6,523. Adding the sum brought forward from the last account, namely, £7,000, there is a sum of £18,556 to be dealt with. After adding £4,000 to reserve, which now stands at £110,000, a dividend of 6 per cent. per annum on the ordinary shares is recommended, carrying forward a balance of £6,756. The meeting will be held on 28th inst.

DRAKE & GORHAM. The report for the year ended June 30th, 1908, states that, after payment of all charges, including bonuses due to staff, there remains a net profit of £7,577, including £1,399 brought forward, which it is proposed to appropriate as follows:—It is proposed to pay a dividend of 5 per cent. per annum, and to carry forward £1,327. Mr. Gorham has ceased to act as a managing director, but retains his seat on the board. Mr. M. G. Drake and Mr. Hamilton have been appointed managing directors in lieu of employee managing directors.

ELECTRIC SUPPLY CORPORATION. The report for the year ended December 31st, 1907, states that the gross revenue (including the revenue from Totnes and Chelmsford) amounted to £20,960, a marked increase on the total £7,285 for the previous year. The receipts from the working of the Dumbarton tramway, £3,543, will not appear again as the line has been made over to the new company. As a result of the year's working, the sum of £5,456 has been brought into the net revenue account, as compared with £2,786 in the preceding year, an increase of nearly 100 per cent., which the directors consider satisfactory and encouraging for the future. The company has thus earned net profits sufficient to pay the debenture interest, and the interest on temporary loans, while the full dividend of 5 per cent. on the share capital has been paid to the proprietors from the sum received from the guarantors. The capital for the new Dumbarton Burgh & County Tramways Co. has been fully subscribed, and the extensions of the line are now completed. The entire system, which comprises about 13 miles of tramway, was opened for traffic in July last, and should substantially contribute to the prosperity of this Corporation. Royal Assent was given in July of last year to the Bill promoted by this Corporation, referred to in the last report, for vesting in the Corporation the various undertakings and for giving legal sanction to the agreements with the local authorities. Under this Act the Chelmsford and the Totnes companies have ceased to exist, and have been merged into the general business of this Corporation. The Hendon Electric Lighting Order was excluded from the Bill, as it was deemed advisable to form a separate company to work the Order. This has been effected by the formation of the Hendon Electric Supply Co., Ltd., in which the Corporation retains a substantial interest. Good progress has already been made, and, as the district is rapidly growing, the directors consider the interest of the Corporation in this undertaking a valuable asset. Owing to the pressure of other work, the directors regret that Mr. C. F. Tufnell has found it necessary to retire from the Board. Mr. F. R. Reeves, having relinquished the secretaryship, has been appointed to fill the vacancy thus occasioned. This appointment will require confirmation by the shareholders. The meeting is on the 29th inst.

FERRANTI.—The report for the year to June 30th shows a profit of £31,165, and after crediting discounts, interests, &c., and deducting general establishment charges, repairs and renewals, legal expenses, bad debts, directors' and trustees' fees there is a balance of £15,421. After deducting expenses *re* prior lien debentures, interest on prior lien debentures, interest on first mortgage debenture stock, interest on bank loan, and depreciation there is a balance of £3,275, which has been deducted from the balance standing at the debit of profit and loss account, reducing the net debit balance to £2,136. The report calls attention to the fact that, in spite of the keen competition in the electrical industry, which does not show any sign of abatement, the results for the year are better than those for the previous twelve months. Prior lien debentures for £20,000 have been issued during the year.

METALLIC SEAMLESS TUBE CO.—At the annual general meeting on Friday, the report and accounts for the past year were adopted. Including the amount brought forward, the sum available for dividend is £6,724, and a further half-year's dividend at the rate of 6 per cent. on the preference shares and 7½ per cent. on the ordinary shares has been declared, carrying forward £4,540.

NEW COMPANIES

ECONOMIC FORCED DRAUGHT & ENGINEERING CO.—This company was registered on October 10th, with a capital of £5,000 in £1 shares, to carry on the business of mechanical and electrical engineers, boiler-makers, smelters, iron and brass founders, manufacturers of and dealers in steam, water, and electrically-driven turbines, &c. The subscribers are J. E. Hackett, 35 Windsor Road, Liverpool, engineer; G. Ogle, 8 Lambeth Road, Liverpool, engineer; J. Goss, 29 Cheapside, Liverpool, engineer. Private company. The number of directors is not to be less than two nor more than four; the subscribers are to appoint the first. Qualification, 100 shares. Registered office, 5 Castle Street, Liverpool.

FREDERICK A. ROBERTS.—This company was registered on October 10th, with a capital of £3,000 in £1 shares, to acquire the business carried on by F. A. Roberts, and to carry on the business of patent experts, electrical, mechanical, and general engineers, model makers, draughtsmen, dealers in novelties and inventions, &c. The subscribers are B. S. James, 119 St. George's Road, Southwark, S.E., mining engineer; N. Le Fevre, 1 Cranworth Gardens, Brixton, S.W., designer; J. H. Brockmann, 59A Bishopsgate Street, E.C., mining engineer; F. Brooker, 13 Larch Road, Balham, S.W., engineer; O. E. K. Roberts, 4 Clock Terrace, Hampton Street, S.E., builder; H. Gerdon, 15 Dalmeny Road, N., engineer; R. J. W. Brown, 49 King William Street, E.C., engineer. Minimum cash subscription, seven shares. The number of directors is not to be less than two nor more than five; the first are O. E. K. Roberts, R. J. W. Brown, and F. A. Roberts. Three thousand pounds is payable in cash and shares to the vendor (F. A. Roberts). Total purchase price, £3,000 (£208 cash and £2,792 shares). Contracts may be inspected at the registered office, 49 King William Street, E.C.

REES ROTURBO MANUFACTURING CO.—This company has been registered, with a capital of £250,000 in £1 shares, to acquire the assets and liabilities of Thomas Parker, at Wednesfield Road, Wolverhampton, to adopt an agreement with the said old company and W. A. Nelson, the liquidator thereof, and to carry on the business of ironfounders, engineers, manufacturers of machinery of all kinds, toolmakers, brassfounders, metal workers, boilermakers, millwrights, machinists, iron and steel converters, winners and workers of minerals and metals, &c. The subscribers are: C. T. Mander, J. E. Underhill, E. S. G. Rees, W. Armistead, C. H. Iles, C. F. Behenn, E. S. W. Moore. The number of directors is not to be less than three, nor more than seven; the first are C. T. Mander, J. E. Underhill, E. S. G. Rees, W. Armistead, George Balfour, and J. H. Keep.

JAMES SCOTT.—This company was registered on October 12th, with a capital of £2,500 in £1 shares (500 preference), to acquire the business of an electrical and mechanical engineer carried on by J. Scott at the Knowsley Electrical Works, Knowsley Road, Bootle. The subscribers are J. Scott, 286 Knowsley Road, Bootle, electrical and mechanical engineer, and F. Bradford, 17 Denman Drive, Newsham Park, Liverpool, electrical and mechanical engineer. Private company. The number of directors is not to be more than three; the first are J. Scott and F. Bradford. Remuneration, £208 and £130 per annum respectively. Registered by Drivers, Cobbs Court, Carter Lane, E.C.

APPOINTMENTS AND PERSONAL NOTES

The post of head of the Physics and Electrical Engineering Department of the Victoria Jubilee Technical Institute, Bombay. Salary, Rs.600 to Rs.800 per month. Applications to D. E. Wacha, Provisional Honorary Secretary of the Board of Trustees, the Institute, by November 30th.

A silver cigarette-case and match-box, suitably engraved, has been presented to Mr. L. H. Howe on his leaving Windsor and Eton Electrical Installation Co. to take up an appointment under the Aldershot Town Council.

Mr. Ben H. Morgan, of Queen Anne's Chambers, Westminster, has been appointed consulting engineer to the Clyde Engineering Co., Ltd., of Sydney, New South Wales, builders of locomotives, railway carriages, steam engines, pumps, and agricultural machinery, and also to the Geelong Harbour Trust Commissioners, Geelong, Victoria.

The Coventry Electric Light Committee have acceded to an application from Mr. G. Tough, station superintendent, to be placed in charge of the electricity works for a period of six months, in order to afford him an opportunity of proving his ability to manage the undertaking. Mr. Tough has held his present post for over ten years, and, the committee state, he has proved himself most efficient, having been chiefly instrumental in bringing about reforms and economies which have placed the works costs of the county station among the lowest in the kingdom.

On the recommendation of the L.C.C. Highways Committee, Mr. C. R. Johnson, at present District Traffic Superintendent (Northern Tramway Section), has been appointed Inventory Officer in the Tramways Department, at a salary of £200 per annum. Mr. Johnson's duties will consist of keeping a careful inventory of the stock of stores, machine parts, &c., at the various tramway depots.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f., quoted on Tuesday night, was £61 10s. to £62 per ton (last week £62 to £62 10s.)

COMBINATION METALLIC PACKING.—The combination Metallic Packing Co., Ltd., Gateshead-on-Tyne, notify us that they have been awarded a Gold Medal and Diploma at a special exhibition in Russia.

COOPER HEWITT LAMPS.—The British Westinghouse Electric & Manufacturing Co., Ltd., announce that Cooper Hewitt mercury vapour lamps, hitherto manufactured in France and Germany, are now being manufactured in England for sale direct to users and the trade. Inquiries for these lamps should be addressed as heretofore to the British Westinghouse Company at Trafford Park, Manchester, or any of their branch offices.

DISSOLUTION OF PARTNERSHIP.—K. O. Müller and C. Müller, carrying on business as electrical accessories merchants, 10 Arcade, Westgate, Bradford, have dissolved partnership.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A first meeting of creditors was held last week in the bankruptcy of Charles Arthur Hemingway, trading as Hemingway & Pitt, electrical engineer, Eton Street, Richmond, when a statement of affairs, as at October 5th last, was presented. This showed liabilities amounting to £2,603 19s. 1d. After allowing £56 5s. 10d. for preference claims the assets were expected to produce £787 11s. 5d., a deficiency being thus disclosed of £1,816 7s. 8d. The following were appointed to act as a committee of inspection:—Mr. Whitford (General Electric Co.), Mr. Rooke (Sloane Electrical Co.), and Mr. E. H. Hawkins (Poppleton & Appleby).

NEWALL ENGINEERING CO.—Messrs. Peter Hooker, Ltd., of Walthamstow, have purchased from the liquidator of the Newall Engineering Co., Ltd., the entire plant, stocks, patents, and goodwill of that company's business in limit gauges, measuring machines, micrometers, surface plates, and other products, established now for about seven years, and will continue the same as a department of their own business under the name of The Newall Engineering Co., at their works, Blackhorse Lane, Walthamstow, London, E.

MISCELLANEOUS CITY NOTES

BUENOS AYRES LACROZE TRAMWAYS CO.—Subscriptions are being invited to an issue of £200,000 five per cent. first mortgage debenture stock at 96. The stock is secured by a trust deed dated July 25th, 1905, and supplemental trust deeds dated June 7th, 1906, and August 27th, 1907, in favour of the Anglo-American Debenture Corporation, Ltd., as trustees. Specific mortgages, in accordance with the Argentine law, have been executed, constituting the debenture stock now issued, a first mortgage and charge on the lands, buildings, and depôts, including machinery, rolling stock, and concessions of the company. The tramways were converted to electric traction in 1905, and now consist of 38½ miles, of which 25½ miles are owned by the company, four miles are owned jointly, and nine miles are worked under running powers over several companies' lines.

CALCUTTA ELECTRIC SUPPLY CORPORATION.—An interim dividend of 6½ per cent. per annum for the half-year ended June 30th upon the ordinary shares has been recommended.

COMPANIES STRUCK OFF REGISTER.—The names of the following companies have been struck off the register, and the companies dissolved:—Electrical Appliances Syndicate, Electrical Productions, Electro Smelting Co., Irish Electric Railways Co., Helios Electrical Construction Co., North-West London Electric Supply Co., and Uddingston District Electric Lighting Co.

EDISON & SWAN UNITED ELECTRIC LIGHT CO.—The directors have recommended the payment of a dividend for the year, at the rate of 2½ per cent. per annum, being 1s. 6d. per share on the "A" shares partly paid, and 2s. 6d. per share fully paid, each less income tax. The annual meeting of the shareholders will be held on Thursday, October 29th, 1908.

ORIENTAL TELEPHONE & ELECTRIC CO.—The following interim dividends have been declared:—(1) 3 per cent. on the 6 per cent. cumulative preference shares for the current year, less income tax, and (2) 3 per cent. on the ordinary shares, free of income tax, payable to those shareholders whose names are on the share registers of the company at this date. The share transfer books will be closed from the 15th to the 28th inst., both days inclusive.

UNITED ELECTRIC TRAMWAYS OF MONTE VIDEO.—Mr. George A. Touche has been elected chairman in succession to the late Mr. William Trotter.

COMPANY MORTGAGES

Particulars of mortgages and charges have been filed as under:—

ALUMINIUM CORPORATION. A deposit of deeds on August 29th, 1908, to secure all moneys owing to Lloyds Bank, Ltd., up to £26,200, has been registered.

AMALGAMATED RADIO TELEGRAPH CO.—A debenture, dated September 11th, 1908, to secure £350, and further advances, charged on the company's undertaking and property, present and future, including uncalled capital, has been registered. Holders—H. Malpas and Mrs. M. M. Malpas, 46 Halsey Street, Chelsea.

BRADFORD ELECTRICAL ENGINEERING CO.—A debenture dated September 17th, 1908, to secure £100, charged on the company's undertaking and property, present and future, including uncalled capital, has been registered. Holder—J. Garnett, 40 St. Paul's Road, Bradford.

BUENOS AYRES ELECTRIC TRAMWAYS CO. (1901).—An acknowledgment of indebtedness dated September 18th, 1908, securing £1,100 (making, with £78,600 already outstanding, a total of £79,700, part of £100,000 five per cent. second or "B" debentures authorised and secured by trust deed of March 30th, 1906), has been registered. Property charged—Concessions and premises mortgaged by said trust deed and the company's general assets. Trustees Sir Walpole Greenwell, Bart., and F. C. Tiarks.

ELECTRIC LIGHT, POWER & HIRING CO.—Deposit of deeds in 1906, securing £11,899.

ENTWISTLE & GASS.—Debentures, dated 1889, securing £10,900.

H. HOOPER & CO.—Particulars of £1,000 debentures, created by resolution of September, 1908, have been filed pursuant to section 10 (3) of the Companies Act, 1907, the amount of the present issue being £500. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

HORSFALL DESTRUCTOR CO.—A letter of charge, under seal dated September 17th, 1908, to secure advances which the mortgagees may from time to time make in connection with the company's contract with the City of Melbourne for the erection of a destructor plant, has been registered. Property charged—Moneys payable to company under the said contract. Holders—Findlay Durham and Brodie, 110 Cannon Street, E.C.

KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO.—Trust deed October 1st, for securing £50,000 second debenture stock, to be issued jointly with the Notting Hill Electric Lighting Co., Ltd.; trustees: R. E. B. Crompton and A. E. Franklin (freehold land situate near Wood Lane, Hammersmith, together with the generating station, fixed plant, and machinery).

MORRIS-HAWKINS.—Deposit of deeds, dated September 3rd, 1908, to secure all moneys due or to become due to the London Joint Stock Bank, Ltd., 5 Princes Street, E.C., has been registered. Property charged—Certain freehold land and premises at Dagenham.

MOUNTAIN & GIBSON.—Issue on September 25th, of £1,000, and on September 28th of £300 debentures, part of series of which particulars have already been filed.

SANDYCROFT FOUNDRY CO. Issue on September 19th of £300 six per cent. debentures, part of series of which particulars have already been filed.

COMPARATIVE RUNNING COSTS OF ARC LAMPS AND METAL FILAMENT LAMPS

Up to a year or so ago, the only practical sources of electric light were arc lamps and carbon glow lamps. Each had its own particular sphere of usefulness; the arc lamp was only generally known in units of hundreds of candle-power, and the glow lamp only in units of 50 candle-power and less. Carbon glow lamps of 100 and even 500 candle-power have been manufactured, but these never came into extended practical use on account of their high running costs. There was thus always a great gap between the 50-c.p. carbon glow lamp and the arc lamp of several hundreds of candle-power. Some time ago, however, the small pattern of enclosed arc lamps appeared on the market, and also Nernst lamps for one or two hundred candle-power. The former, partly on account of the simple mechanism necessary to bring the cost down to a reasonable value, are not in every way satisfactory as regards evenness in burning, and the latter, beside being somewhat troublesome and costly to keep running, have shown themselves ill adapted for use on alternating-current or low-pressure continuous-current circuits. The high candle-power metal filament lamp, however, seems to be admirably suited to fill this gap, and, as has been mentioned at various times in these columns, has already found a considerable field of usefulness in street lighting.

These are the views expressed in an interesting paper read before the Verband Deutscher Elektrotechniker at their summer meeting at Erfurt by Mr. H. Remané, of the Auergesellschaft of Berlin (the makers of the Osram lamp in Germany). The author dealt in this Paper with the relative advantages of arc lamps and metal filament lamps for lighting units of between 100 and 500 mean hemispherical candle-power. The curves given in the Paper were based on figures obtained in practice with Osram lamps of from 100 to 400 Hefner candle-power (mean horizontal candle-power), which can be obtained for any pressures between 110 and 250 volts. The specific consumption or "efficiency" of these lamps varies from 1·0 to 1·1 watt per (mean horizontal) Hefner candle, or 1·1 to 1·21 watts per British standard candle (using the latest determination of the ratio of the Hefner to the British unit—namely, 0·91). It is stated that the falling off in candle-power is about the same with these high candle-power lamps as with the low candle-power Osram lamps—namely, from 5 to 6 per cent. after a life of 800 hours, which is assumed to be the average life. The following constants in connection with the high candle-power lamps are also given: The mean spherical candle-power is, on the average, 79 per cent. of the mean horizontal candle-power, which value has also been obtained for the low candle-power Osram lamps at the Physikalisch-Technische Reichsanstalt; the specific consumption or "efficiency" reduced to the mean spherical candle-power works out at 1·39 watts per Hefner candle; the mean hemispherical candle-power is about 82 per cent. of the mean horizontal; and the specific consumption based on this value of the candle-power is 1·33 watts per Hefner candle. These high candle-power lamps are generally provided with reflectors, and for outdoor work the lamp itself is protected by means of a clear glass globe. This globe reduces the mean hemispherical candle-power by about 7 per cent. In making the comparisons, figures obtained with lamps protected in this way were employed.

The curves in Fig. 1 show the specific consumption or "efficiency" in watts per Hefner candle reduced to the mean hemispherical candle-power for Osram lamps and various small arc lamps of different candle-powers. The figures on which the curve for the Osram lamp is based are as follow: Four sizes of lamps of 100, 200, 300, and 400 mean horizontal candle-power respectively have mean spherical candle-powers of 79, 158, 238, and 316 c.p., and mean hemispherical candle-powers (with reflectors and protecting globes) of 105, 209, 316, and 414 c.p. The specific consumption or "efficiency" of all four sizes is 1·05 watts for Hefner candle, reduced to the above values of the mean hemispherical candle-power. The curve for the Osram lamp in Fig. 1 is thus a straight line. In order to obtain the curve for the continuous-current arc lamps, the following figures were used: Three sizes of open arc lamps with pure carbons taking 3, 4, and 5 amperes respectively, running two in series, on a 110-volt circuit with 42 to 45 volts per lamp, were assumed to consume 165, 220, and 275 watts respectively. These have mean hemispherical candle-powers of 112, 187, and 262, and specific consumptions of 1·47, 1·17, and 1·05 watts per Hefner candle. To represent the alternating current arc, lamps taking from 6 to 20 amperes and running three in series on a 110-volt circuit were taken as examples. The specific consumptions of these are shown by the curve in Fig. 1. Continuous-current enclosed arcs of from 2·5 to 6·5 amps, and for pressures of from 75 to 80 volts are represented by the uppermost curve of Fig. 1. In all cases the figures at the points on the arc lamp curves denote the current taken by

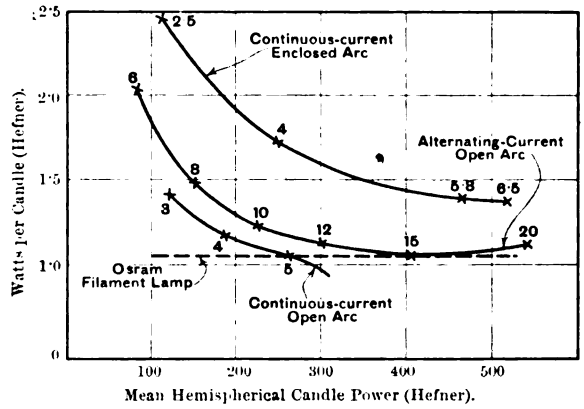

FIG. 1.—SPECIFIC CONSUMPTION OR "EFFICIENCY" FOR VARIOUS CANDLE POWERS IN WATTS PER MEAN HEMISPHERICAL CANDLE.

(The Figures on the Curves denote the Current taken by the Lamps.)

the arc lamp corresponding to that candle-power. As the figures are meant to be those which are obtainable in practice, the absorption of the diffusing globes of the arc lamps, which amounts to about 25 per cent., was allowed for, and the consumption of the series resistances was also included when calculating the specific consumption.

The curves of Fig. 1 show that a specific consumption or "efficiency" as low as that of the Osram lamp is obtained with a 5-ampere continuous-current open arc, or with a 15-ampere alternating-current open arc, both with pure carbons. For candle-powers below the amounts represented by these currents, the consumption in watts per candle is higher than that of the Osram lamp. The 500-candle-power 6·5-amp. enclosed arc has a specific consumption about 30 per cent. higher than that of the Osram lamp, and for candle-powers lower than this the inferiority of the arc lamp is still more evident. In comparing the relative advantages of the two types of lamps, it must be remembered that with the open arc lamps the arrangement of the lamps has also to be made so as to allow of connecting the proper number of lamps in series in each case.

The author then considers the relative running costs obtained with arc lamps and Osram lamps respectively, and deduces the curves shown in Fig. 2. These curves are reckoned on the basis of the mean hemispherical candle-power in all cases, and

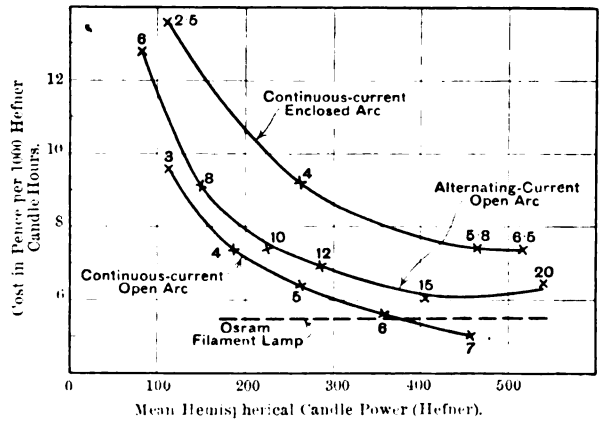

FIG. 2.—RUNNING COSTS IN PENCE PER 1,000 CANDLE HOURS.

(The Figures on the Curves denote the Current taken by the Lamps.)

an average tariff of 45 pfennigs, or 5·4d. per unit. The average life of the Osram lamp was taken at 800 hours, and the prices as follow: 200 c.p., 9s.; 300 c.p., 12s.; and the 400 c.p., 15s.; In estimating the running costs for the arc lamps, the cost of the carbons and attendance was added to the cost of current, but no addition was made for repairs or renewals. The cost

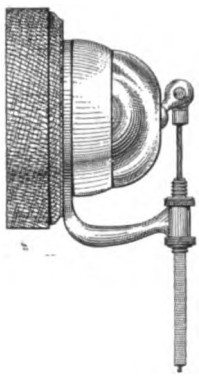
Digitized by Google

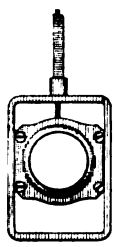
of renewals was, of course, included in the case of the Osram lamps. The curves of Fig. 2 show that the running costs per 100 candle-hours are the same for a 370-c.p. Osram lamp as for a 6-amp. continuous-current open arc lamp; for candle-powers below this, the costs for the Osram lamp are less. Comparing the latter with the enclosed arc, it is found that the running costs for a 6·5-amp. arc lamp are over 35 per cent. higher than those for the equivalent Osram lamp. The running costs for the 15-amp. alternating-current open arc lamp come out about 11 per cent. higher than those for the equivalent Osram lamp. Thus the curves point to the conclusion that in most cases where a light source of from 100 to 500 mean hemispherical candle-power is required, it will be more economical to use a high candle-power metal filament lamp than a small open or enclosed arc lamp. If the costs are estimated on the basis of a lower average cost of current, the positions of the curves are altered, but the relative positions remain about the same.

In the discussion following the Paper, several speakers complained that the figures for the specific consumption or "efficiency" of the arc lamps were not representative, the values given being far higher than those obtained with the improved patterns of these small arc lamps. However, Mr. Remané, in his reply, pointed out that the figures were taken from the latest published results issued by the large firms making these lamps, and contended that the values used were quite representative. The figures assumed for replacement of carbons and for attendance were not challenged. Some difference of opinion was expressed with regard to the colour and the irregular burning of small arc lamps, and some speakers pointed out that metal filament lamps would not show to such advantage as indicated by the curves, if they were used as a substitute for small arc lamps in factories, as the vibration would shorten their life considerably.

A NEW BEDSIDE SWITCH

THE accompanying illustration represents a new arrangement which has just been brought out by Messrs. Drake & Gorham for actuating bedside switches. An ordinary tumbler switch is used, and by means of a simple attachment this is actuated by a "Bowden" wire in a flexible metallic tube by a convenient sliding ring arrangement, which can be placed under the pillow or elsewhere. The device is much less liable to damage than the ordinary flexible cord and "pear" switch, and entirely obviates any remote possibility of shocks which might exist with damaged flexible wires. There are other obvious applications of this ingenious device, such as where re-arrangement of furniture, &c., have made existing switches inaccessible and wiring alterations are undesirable. These switches have made their appearance on Messrs. Drake & Gorham's stand at Manchester since the opening of the exhibition.



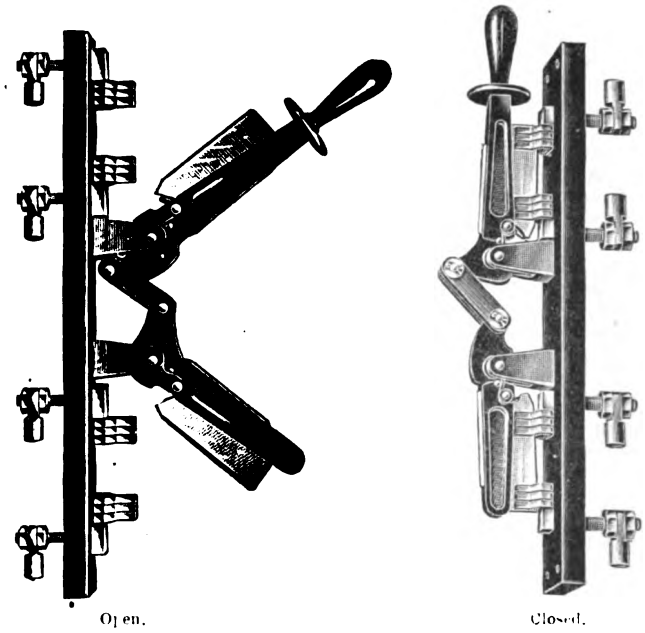


New Drake and Gorham Bedside Switch with Bowden Wire Extension.

London Electric Power Bills.—A conference was held at the National Liberal Club on Wednesday last week in connection with the opposition of the London Borough Councils to the London and District Electric Power Bill. Mr. T. Lough, M.P. (West Islington), presided, and the following resolution was passed on the proposition of Mr. W. Crooks, M.P. (Woolwich):—"That this meeting, while recognising the desirability of making provision in London for the supply of electricity in bulk, is of opinion that this can only be safely done under the control of a central municipal authority, and views with profound alarm the London and District Electricity Supply Bill, which would confer immense powers over a vast area on the promoters. It regards with particular apprehension, as contrary to precedent, the provisions of the measure which would enable the promoters to acquire, without coming to Parliament, the undertakings of public authorities throughout the various areas, and for these reasons it appeals to the Government, and to all members of Parliament representing the wide district included, to oppose the further progress of the Bill, and asks for consideration of Mr. Kearley's Electric Supply Bill." A committee was afterwards appointed to represent the delegates, with instructions to take all possible steps to defeat the Bill.

DISTRIBUTION BOARDS

THE accompanying illustrations show a type of distribution board which the General Electric Co. have put on the market recently. In these boards good workmanship and suitability to their purpose have been put before extreme cheapness, and



Open. Closed.

Fig. 1.—Tandem Coupled "Peel" Switch.

their substantial nature is a welcome contrast to some of the productions of the price-cutting to which there has recently been a tendency in this class of work. A current density of not more than 800 amperes per square inch has been allowed for in all current-carrying parts, which alone does not allow them to be sold at "competition" prices. The form of switch used in an adaptation of the company's well-known "Peel" switch,

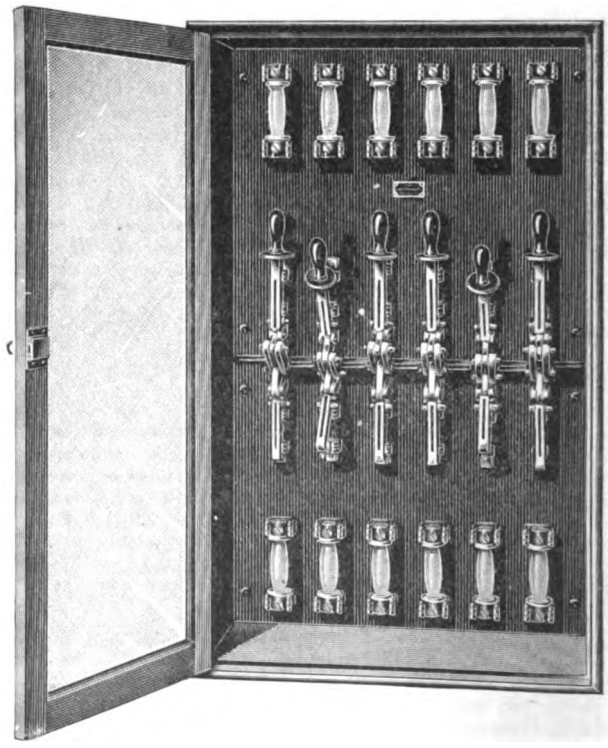


Fig. 2.—G.E.C. Distribution Board.

a special tandem pattern of which has been designed in order to minimise space. The action of this is shown in the illustrations. The equipment of the board is completed by enclosed porcelain tube fuses on both poles, and the whole is enclosed in a strong teak cabinet with glazed front.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

THE first meeting of the Council of the International Electrotechnical Commission was held in the Medical Examination Hall, Victoria Embankment, on Monday. Sir John Gavey, C.B., was in the chair, and delegates were present from the following countries:—United States, Great Britain, Germany, France, Sweden, Paraguay, Spain, S. Africa, Russia, Mexico, Denmark, Japan, Canada, Italy, Brazil, Hungary, Australia, and Argentine.

It will be remembered that the International Electrotechnical Commission owed its inception to the following resolution passed at the close of the meetings of the Chamber of Government Delegates at the International Electrical Congress held at St. Louis in September, 1904:—

"That steps should be taken to secure the co-operation of the technical societies of the world by the appointment of a representative Commission to consider the question of the standardisation of the nomenclature and ratings of electrical apparatus and machinery."

The preliminary stages of the movement were taken in hand by a temporary committee of the Institution of Electrical Engineers, and a meeting for the formation of the Commission was held in London in June, 1906. Lord Kelvin was elected the first president, and Colonel R. E. Crompton honorary secretary of the Commission. A set of proposed rules relating to the general organisation of the Commission was drawn up and adopted, subject to ratification by the authorities who had appointed the delegates.

Sir John Gavey, before calling upon the Rt. Hon. A. J. Balfour, M.P., to welcome the delegates, explained that his presence in the chair was owing to the lamented death of their late President, Lord Kelvin.

The Right Hon. A. J. Balfour, M.P., said he had the greatest pleasure in offering the warmest welcome to the delegates. After paying a tribute to Lord Kelvin, he said that what was wanted was a plain and intelligible medium between the manufacturer and the user. The Commission should aim at the framing of rules which would not hamper the free development of the electrical industry, and although another Commission was sitting at the present moment dealing with electrical units, the present Commission was more immediately connected with the practical aspects of electrical theory.

The first business was the election of a new President, and on the motion of Dr. E. Budde (Germany), seconded by Sir John Gavey (Great Britain), Prof. Elihu Thomson (United States), was unanimously elected to this office for the coming year.

On the motion of the French delegates, supported by the Mexican delegates, Col. Crompton was re-elected honorary international secretary.

The next item on the agenda was the consideration of one or two modifications, prior to the ratification of the rules. The first was the replacement of the word "Local" throughout by the ward "Electrotechnical," and after a brief discussion, in which the German delegates objected, it was decided to leave the matter over for a private committee meeting, which was held on Tuesday. Rule No. 6 at present reads as follows:—"The central offices of the Commission shall be situated, for the present, in London, at the offices of the Institution of Electrical Engineers, 92 Victoria Street, Westminster, S.W., and, temporarily, the secretary of the Institution of Electrical Engineers may act as secretary." It was unanimously resolved to replace this by the following:—"The central office of the Commission shall be established at present in London at 28 Victoria Street, Westminster, S.W."

Another proposed modification, stipulating that any change in the voting power can only be made by unanimous vote, was also postponed to the private committee meeting referred to above.

Colonel Crompton then read his annual report as hon. secretary, which is given in abstract below:—

At the close of our preliminary meeting, held on June 26th, 1906, you entrusted to my care the further organisation of the work of this Commission, and it is my duty, therefore, to report to you in detail what has taken place since that date.

In October, 1906, the Central Office was started with M. Le Maistre's help. I brought the matter before the British Institution of Electrical Engineers. The Council of the Institution responded very sympathetically, and in December of that year decided to defray the entire cost of the preliminary meeting and preliminary organisation, thus making a free gift to the Commission of nearly £200. The Central Office was thus enabled to start the year 1907 entirely free of debt, but as only a few subscriptions had at that time been received, the Council of the Institution of Electrical Engineers decided to make the Commission a loan of £200. During this year subscriptions have been received from Canada, Denmark, England, France, Germany, Hungary, Mexico, Spain, Sweden, and the U.S.A., and correspondence has been opened with several of those countries not represented at our preliminary meeting with the result that very considerable progress is being made towards the formation of a committee in several countries.

In the Argentine Republic Mr. Stewart and Prof. Jorge Newbery are prosecuting the first inquiries. A committee was formed in Austria in September, 1907, but since that time it has, I am afraid, been in a state of suspended animation. I hope, however, that matters will be properly rearranged shortly. In Australia the matter is in the hands of Mr. Atlee Hunt, Secretary to the Minister of External Affairs in Australia. In Belgium the Union Syndicate des Electriciens Belges have taken the matter up jointly with the Société Belge d'Electriciens, and a successful issue may be honed for very shortly. The Société Belge d'Electriciens very generously forwarded, not a subscription, as their committee was not formed, but a donation of £20 towards the expenses of the Central Office. With regard to Brazil, considerable difficulty has been experienced in getting into touch with the representatives of the industry, but it is hoped that a committee will be formed during the present year. The Electrical Section of the Royal Institut van Ingenieurs of the Hague, Holland, being somewhat small in numbers, do not find themselves at present able to join in the work of the Commission.

With regard to Italy, the acting secretary had the pleasure of meeting Mr. Semenza at the Electrical Congress at Marseilles, and I have every hope of seeing the matter pushed forward to a successful issue at no distant date. The Council of the Japanese Society have, I understand, appointed a committee to raise the necessary funds to enable them to carry out, in an adequate manner, the work of an Electrotechnical Committee, which Dr. Fujioka says they feel sure of being able to do shortly. In Norway the formation of a committee has been sanctioned, and it will be constituted at the beginning of next year. At the request of a Roumanian engineer, resident in this country, full information with regard to the Commission has been sent to Roumania. A committee will be formed in Russia, I think, next month. The South African Association of Engineers, whose representative present to-day is Mr. Lee Murray, are also taking great interest in the subject. A committee has not, as yet, been formed in Switzerland. I should like here to make reference to the generous donation of the Danish Committee, which was formed in June, 1908. The Danish Engineering Society, who were communicated with in 1907, were unable to form their committee during that year, but to show their interest they took in the work of our Commission, they very kindly sent a donation of £20 towards our expenses.

Thus ten Electrotechnical Committees have been officially constituted, and are in proper working order; in six countries committees will be formed very shortly, and in another six countries the matter is being considered with a view to forming a committee.

Colonel Crompton then referred to one or two items on the agenda of the committee, which have held private meetings during the week. Mention was first made of the suggestions with regard to nomenclature, which were sent out in February, 1903, to all Electrotechnical Committees. These suggestions, on the whole, were well received, but the criticisms of the German committee on certain of the suggestions were so much to the point that after careful consideration he decided to amend the former suggestions. The French committee have requested that the subject of the metric system should be considered, and this will form one item on the agenda before the committee. The question of symbols has been set in train by the British committee, and this subject will also be considered by the committee. It is no doubt, however, an extremely difficult question and must be approached with the greatest caution. There is also another important question which has been brought before the Commission by the French committee, and that is the question of a provisional standard of light. This question will also be examined by the committee. A further question which has been referred to the Commission is the subject of regulations for fire insurance for interior electrical wiring. This matter was discussed at the Electrical Congress at Marseilles, and he suggested that this also be referred to the committee to be reported upon.

Turning now to financial matters, the report suggested that each year the total expenses of the Central Office should be equally divided by the number of Electrotechnical Committees actually formed. The estimate for the next year should be framed so as to provide for a small surplus at the end of the

Digitized by Google

year, and this would have the effect of diminishing the amount asked for to cover the expenses of the following year. In the case in which the amount asked for from each committee had not been entirely expended, the balance would be so much to the credit of each committee, and the Central Office would then ask for some figure smaller than £50 depending on this balance.

In conclusion, Col. Crompton asked the Council to confirm his selection of Mr. Le Maistre, and to formally appoint him secretary of the Commission.

On the motion of the Canadian delegate, seconded by the French delegate, the report was adopted, and a separate resolution passed, expressing the appreciation of the Council at the action of the Institution of Electrical Engineers in founding not only the British committee but also the Central Offices of the committee.

Sir John Gavey proposed the appointment of a committee to consider and report to the Council upon proposals with reference to nomenclature, standards of light, &c., and it was resolved to appoint the whole Council. A number of other matters were also referred to this committee.

This closed the business of the meeting. As already mentioned, the committee meetings are private.

On Monday the delegates were entertained at dinner by the "Dynamicables" at the Franco-British Exhibition. On Tuesday the Central Telephone Exchange, Carter Lane, London, was visited. On Wednesday visits were paid to the Lots Road power station and the Earl's Court signalling cabin of the Underground Electric Railways Co. of London. The delegates have been invited to the Institution dinner to-night. A committee meeting was held on Tuesday and another will be held to-day, and to-morrow the Council will meet to receive the report of the committee.

Manchester Association of Engineers.—We are pleased to announce that Mr. S. L. Pearce, Chief Electrical Engineer to the Manchester Corporation, has been awarded the "Constantine" Gold Medal, which is presented annually for the best Paper read before the above society during the session, for his Paper on "Steam Turbine Engineering," read in March last (see Electrical Engineering, Vol. III., page 433).

Utilisation of the Tides for Industrial Purposes.—It is stated in a British Consular report that a company has been formed at Hamburg for utilising the force of the tides at Cuxhaven (at the mouth of the Elbe) for the production and transmission of electric power to factories for making ice, liquid air, as well as substitutes for nitrates, &c. It is stated that the necessary capital, viz., about £150.000, has now been raised amongst financial firms at Hamburg, and that various buildings, plant, and other preparations at Cuxhaven connected with the undertaking are now in course of completion.

Leeds Local Section I.E.E.—The first meeting for the session of the Leeds Local Section of the Institution of Electrical Engineers will be held on Wednesday next, October 28th, at the University, Leeds, at 7 p.m. Mr. H. E. Yerbury, the chairman, will deliver his inaugural address, and this will be followed by a Paper by Captain Gardener on "Electric Signalling on Railways." At the November meeting of the section a Paper will be read by Mr. W. N. Y. King on "Comparison of Natural and Induced Draught Systems."

Storage Batteries in Generating Stations.—*A propos* of the discussion at the Nottingham Convention of the Municipal Electrical Association upon Mr. A. M. Taylor's Paper on storage batteries, the "D.P." Battery Co., Ltd., of Bakewell, send us the following figures as an example of the saving resulting from the installation of a battery in a station which has been erected and running some years. The results of the working were kindly furnished by the electrical engineer to the station. A Diesel oil engine was the motive power, having a guaranteed consumption of 0·468 lb. per b.h.p. hour at three-quarter load. It appears that in November, 1906, before the battery was installed, 10·2 units were generated per gallon of fuel, whereas in November, 1907, after the battery was put in, it was found possible to obtain 12·3 units per gallon. Assuming, therefore, that this improvement is solely due to the introduction of the battery, its use enabled an increase of 20 per cent. in the output to be obtained on the same consumption of fuel. Putting the matter in another way, in November, 1906, the total units generated were 24,628, and 22,718 lb. of oil were consumed; and in November, 1907, with the battery in use, 24,516 units were generated from 18,198 lb. of oil. Thus the consumption of fuel was reduced by 24 per cent. on practically the same load. The average fuel consumption for four months' working, viz., November to February inclusive, was 0·580 lb. per b.h.p. hour without battery, and 0·474 lb. per b.h.p. hour with battery. The reduction in the average consumption thus shown is 22·15 per cent. These figures are striking, but are by no means the actual measure of total economy claimed for the installing of a battery was followed by a reduction in the wages sheet, stores supply, &c.

CATALOGUES AND PAMPHLETS RECEIVED

BATTERIES.—An attractive show-card is being issued by Messrs. Siemens Brothers and Co., Ltd., of 12 Queen Anne's Gate and Woolwich, calling attention to the various forms of primary batteries for bells, telephones, motor-car ignition, &c., made by them. Representations of the ordinary fluid Leclanché cell and the well-known "Obach" dry cell are given.

DRAWING AND SURVEYING INSTRUMENTS.—A booklet from H. Morin, of Paris, describes a number of drawing, surveying, and other instruments, including a useful form of water-level for lining up shafting, machines, &c., and measuring small deflections of bridges, floors, and other structures. Another speciality is a hyperbolic square by which the area of plane figures can be readily measured without the use of a planimeter.

ELECTRICAL SUPPLIES.—One of the most handy forms of complete catalogue of electrical plant, fittings, and accessories that we have seen is the handsome new publication of Messrs. Verity's. Departing from their well-known single quarto volume, the firm have produced a catalogue in three separate cloth-bound octavo volumes, each of nearly 400 well-printed pages. The three books are contained in a neat cloth-covered case, with partitions, and the whole in external appearance more resembles a three-volume novel than a technical catalogue. The sections are devoted to plant, fittings, and sundries respectively, and it is not too much to say that prices are given for everything connected with electrical engineering and the allied industries, from a complete turbo-generator to a conduit clip. Attention should be particularly drawn to the fittings volume on account of the quality of the illustrations and the variety and artistic nature of the designs they represent.

INSTRUMENTS.—A well-arranged leaflet from Messrs. Johnson & Phillips, of Charlton, contains illustrations and particulars of a considerable variety of ammeters and voltmeters. Permanent magnet-moving coil instruments are included in the round, sector, edgewise, and portable patterns for a large number of ranges. Another special feature is the collection of hot-wire switchboard and portable ammeters and voltmeters for continuous and alternating currents, with maximum readings ranging from 0·2 to 1,500 amperes and 1 to 5,000 volts. The list also contains particulars of a cheaper line of spring-controlled dead-beat moving iron ammeters and voltmeters for continuous and alternating currents in round or sector pattern cases.

METALLIC PACKING.—A collection of leaflets, &c., from the Combination Metallic Packing Co., Ltd., of Gateshead-on-Tyne, gives an idea of the universality of the company's metallic packing for marine purposes by a list of some 1,600 ships on board which it is in use. It is also estimated that over 10,000 sets of this style of packing are in use in the electric light and power stations. As well as the well-known piston-rod packing, particulars are given of jointing rings for various purposes. Further leaflets describe the "Moller" drain-cock for steam pipes, steam whistles, &c., in which the drain is always open when the steam is shut off, but closes with the opening of the steam valve.

RESISTANCES.—A comprehensive new list from the Union Electric Co., Ltd., contains particulars of regulating and other resistances for various purposes. The series of shunt regulators is very complete, and ranges from simple patterns for temporary and portable use, to complete switchboard equipments of several interlinked regulators for groups of machines working in parallel, operated singly or together, either by hand or automatically. In one form of automatic regulator, the controlling device consists of a solenoid with movable core, to which is attached a trough of insulating material, containing mercury. The ends of the resistance spirals are fixed above this trough in the form of a comb, with teeth of gradually decreasing length; consequently, as the core of the solenoid moves either down or up, more or less of the resistance spirals are brought into the circuit. The list also deals with arc lamp and other series resistances, calibration resistances for meter testing, banks of lamps for test-room purposes, and artificial loads for technical college laboratories, &c.

TRANSFORMERS.—Messrs. Johnson & Phillips, of Charlton, have issued a new leaflet describing their single- or three-phase air-cooled and oil-cooled transformers. The air-cooled patterns are standardised up to 100 KVA., and the oil-cooled patterns up to 400 KVA. Oil-insulated and water-cooled transformers can be made up to any size

---

Wireless Telegraphy.—The *Times* correspondent at Wellington (N.Z.) states that an English wireless telegraphy syndicate has submitted proposals for establishing wireless telegraphic connection between New Zealand, Australia, and seven important Pacific islands. The proposal is being strongly supported in the Pacific, and it is understood that the Commonwealth Government is inclined to accept it. The New Zealand Premier also favours the project, but he wishes the Auckland and Chatham Islands to be included in the scheme. If the project is carried out several of the Union Company's steamers will probably be fitted with wireless apparatus.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 15th, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in brackets indicate communicators of inventions from abroad.

1907 Patents

21,271, **Direct Reading Potentiometer for the Measurement of Resistances.** Eyershed & Vignoles, Ltd., and S. Evershed. This apparatus, which is especially suitable for the measurement of low resistances, comprises an indicating instrument of the aperiodic moving-coil type with two separately wound and oppositely acting coils, termed the main and balance coils respectively, and also a direct reading resistance box in the main coil circuit, and a reciprocal reading resistance box in the balance coil circuit. The main coil is connected in parallel with the test resistance and the balance coil in parallel with the standard resistance. By varying the resistances in circuit the torques of the coils are balanced, and then the resistance is read direct from the main resistance box. Special contacts for connecting both the main circuit and the potentiometer circuit to the resistance under test are also described in the specification. Seven claims, seven figures.

23,816, **Control of Tramway Brakes.** M. Cummins. When the hand-brakes of a tramcar are applied, and the wheels skid, the motor armatures do not rotate, and the rheostatic or magnetic brakes are rendered inoperative. The present invention provides for an interlocking arrangement, which compels the driver to release the hand-brakes before applying the rheostatic or magnetic brakes. One claim, three figures.

28,137, **Centrifugally Operated Switch for Squirrel-Cage Motors.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). To increase the starting torque and to diminish the starting current of squirrel-cage induction motors, the end rings of the rotor are sometimes cut in several places. This, however, has a bad effect on the slip and efficiency at high speeds, as it is equivalent to inserting resistance in the rotor circuit. To overcome this defect the present invention provides for the use of small centrifugally acting switches which bridge over the breaks in the rotor rings when a certain speed is attained. Two claims, two figures.

1908 Patents

1,420, **Preparation of Wood for use in Accumulator Cells.** The Chloride Electrical Storage Co., Ltd., and B. Heap. Wood, preferably a light white wood, for use as separators, supports, or containing vessels of accumulators, is, according to this invention, prepared as follows:—It is first soaked in an alcoholic solution of caustic alkali, with an addition of about 25 per cent. by volume of water for a period varying from two to twelve hours. After successive washings in alcohol it is dried slowly in a current of warm air. This removes the resins and natural acids without affecting the shape or giving rise to splitting on drying. Three claims.

9,697, **Tumbler Switch.** The Thames Iron Works, Shipbuilding & Engineering Co., Ltd., and W. H. Flood. A tumbler switch for heavy work, consisting of a movable contact pivoted at the end of a toggle lever and provided with a rod which slides through a guide on the lever. When the tumbler is depressed a spring coiled round the rod is compressed; at the end of the movement the spring is released and the movable contact forced suddenly into the fixed contacts. Three claims, five figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

17,195, Hatfield. Electrolytic rectifiers.
17,532, Mitchell. Surface contact traction systems.
19,068, Rüdenberg. Producing alternating currents of high periodicity.
21,176, Sohm. Electric signal systems.
21,516, Good. Automatic transformer switch.
21,574, Thompson (*Polyphos Elektrizitats Ges.*). Induction coils for generating high tension current.
21,742, Paterson. Manufacture of vulcanised bitumen.
21,958, Morris & Lister. Switches.
22,117, J. Stone & Co. & Preston. Secondary batteries.
22,140, Ashton. Spring supports for electric lamps.
22,203, British Thomson-Houston Co. (*Allgemeine Elektricitats Ges.*). Control of electric motors.
22,527, Jacoby. Alternating current motors.
22,869, British Thomson-Houston Co. (*General Electric Co.*). Resistance material.
23,456, Griffin. Magnetos for use on internal-combustion engines.
24,027, Timar & Von Dreger. Arc lamps.
24,260, Page. Means for operating from a distance electrical organ-blowing apparatus.
24,999, Boocock. Track brakes for tramcars and railway trains.
27,224, British Thomson-Houston Co. (*General Electric Co.*). Electrolytic condensers.
28,003, Whipp, Whipp, & Bourne. Loose handle single-pole circuit breakers.
28,106, Tate. Storage battery plates.
28,199, Scott. Electric circuit breakers.

1908 Patents

461, Stearn & Topham. Incandescence electric lamps.
498, Samaia. Apparatus for setting tramway points from a car.
3,504, Wenger. Process for the precipitation of electrolytic copper in the form of sheets with soluble iron anodes.
4,617, Mackenzie (*Ford*). Igniting apparatus for internal-combustion engines.
7,069, Drewell. Connection for closing an optional branch of a frequently branched circuit by means of a limited number of switches.
9,254, Kennedy. Electricity integrating meters.
9,640, Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*). Switching apparatus for controlling electrical machinery.
9,838, Meyer. Regulatable inductive resistance.
10,878, Paschen. Method for regulating the degree of hardness of Röntgen tubes.
12,352, Nobbs, Nobbs, & Rosenthal. Electric radiator for heating buildings.
14,775, Schiessler. Transmitting apparatus for submarine signalling.
18,184, Steynis & Chaumat. Production of ozone.
18,331, Cooper. Systems of operation for alternating-current motors and generators.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

14,420, Lohay. Control of mechanism from a distance
17,438, Siemens & Halske Akt.-Ges. Manufacture of objects of tungsten or of alloys thereof.
17,610, Siemens & Halske Akt.-Ges. Process for improving the ductility of tungsten.
19,054, Beach. Control systems for electrically-propelled vehicles.
19,311, Siemens & Halske Akt.-Ges. Manufacture of incandescence bodies of tungsten.
19,889, Siemens-Schuckert Werke Ges. Repulsion motors.
19,932, Siemens & Halske Akt.-Ges. Manufacture of filaments from tungsten or alloys thereof.
20,205, Cremer. Method for removing corrugations from the tread of rails.
20,282, Aders. Selective actuating mechanism.

Expiring Patents

The following patents expire during the current week after a life of fourteen years:—

20,259, of October 23rd, 1894. **Electrolytic Apparatus.** Carl Kellner. An apparatus for the electrolysis of alkaline salts with the aid of a stationary mercury cathode. The amalgam is moved from the decomposing chamber where it is formed to a combining chamber where the metal separates out from the amalgam, by the movement of inverted bell-shaped partitions. The bells are provided with outlet pipes to carry off the evolved gases.

20,397, of October 25th, 1894. **Arc Lamp Cut-out.** H. J. Creffield. A mechanism for short-circuiting an arc lamp running in series with several others, when the carbons are burnt out, or at any predetermined time. The upper carbon holder is provided with a stop, which, when the carbons are nearly burnt out, bends a spring and closes an auxiliary circuit. This causes the arc to be cut out and the lamp short-circuited through the series coil.

20,475, of October 26th, 1894. **Prepayment Meters.** W. Alexander and W. E. Thompson. A coin-actuated mechanism for electric and other meters. This consists of an escapement wheel held in position by a pawl which can only be moved by the insertion of a coin. The insertion of a coin permits the rotation of the wheel through a certain angle, and this switches on the supply. When the wheel has returned to its original position the supply is switched off.

BODDY'S "METALIK"
METALLIC FILAMENT LAMPS.

Since we **FIRST INTRODUCED** these lamps on to the English Market in 1907, they have **BECOME CELEBRATED** for

REMARKABLE SAVING OF CURRENT, LONG LIFE, SPLENDOUR OF LIGHT,

and have FIRMLY ESTABLISHED themselves in the CONFIDENCE OF LEADING AUTHORITIES, the demand now even Surpassing Expectations, and the lamps are being adopted more and more extensively by CORPORATIONS, PRINCIPAL CONTRACTORS, &c., throughout the United Kingdom.

Will burn in any position. **For Direct or Alternating Current.** **Efficiency: 1¼ watt per C.P.** **Average life over 1000 hours.**

There are no TOUGHER or more EFFICIENT METAL FILAMENT LAMPS on the market than our "METALIKS."

PRICES.

50 to 70 Volts,	16 C.P.	3/-	each.
50 „ 65 „	25 „	3/-	„
66 „ 130 „	25, 32 & 50 C.P.	4/-	„
70 „ 130 „	100 „	7/6	„
200 „ 250 „	50 „	6/-	„
200 „ 250 „	100 „	8/6	„

Large Stocks of the above Voltage and Candle Powers kept at all our Depots for immediate delivery.

Liberal Discounts to the Trade.

Our Filaments are made under a SPECIAL CHEMICAL process, by which they are of a tougher nature than any other METAL filament lamp of this type on the market, at the same time being quite as Highly Efficient.

Practically no Diminution of Candle-Power after **LONG LIFE.**

We are Exhibiting at Manchester Exhibition

Stand No. 198.

We are in the **POSITION** to **OFFER YOU** the **MOST FAVOURABLE TERMS,** and **SATISFACTION IS GUARANTEED.**

THE

MANCHESTER ELECTRICAL EXHIBITION

OF

1908

FOURTH NOTICE

Robertson Electric Lamps, Ltd.,

BROOK GREEN WORKS, HAMMERSMITH. (STAND NOS. 187 & 217.)

Lamp Manufacture.—This firm's attractive stand occupies one of the most prominent positions in the centre of the building, and attracts a large crowd of visitors every afternoon and evening, when several skilled operators from the Hammersmith works demonstrate some of the principal processes in the manufacture of the well-known "Robertson" lamps. The operations shown include :—(1) Attaching the glass tube to the bulb for the purpose of exhausting ; (2) mounting the filament on to the nickel extensions of the platinum leading-in wires and the iron supporting wire ; (3) sealing the mounted filament into the glass bulb ; and (4) exhausting the bulb with the aid of a vacuum pump. The attachment of the glass tube and the sealing-in is carried out with the aid of gas blow-pipes supplied with air under pressure from a small blower. The other processes of manufacture are represented by samples of the prepared cellulose fluids, the squirted filaments, and other items, in a glass show-case. A feature of the stand is the model of a glass cone similar to those in use at the company's glass works at Lemington-on-Tyne. This cone, which serves as an office for the stand, is decorated with lamps, and a realistic effect of flames belching forth from the top of the cone is obtained by the use of a little red muslin and a powerful electric fan.

Metal Filament Lamps.—The manufacture of metal filament lamps is now being carried on at Hammersmith, and these British-made "Osram" lamps will soon be on the market. On the G.E.C. stand opposite the "Robertson" stand, a number of "Osram" and carbon filament lamps of various candle-powers are arranged, with ammeters, to show the comparative current consumption. A large 400-c.p., 200-volt "Osram" lamp, consuming 440 watts, is also exhibited. The fact that the luminous body is distributed over a large area renders the use of a diffusing globe unnecessary.

The Telephone Exchange.

The National Telephone Company's exchange serves also as an exhibit, as the switchboard, with the operators sitting at it, is visible through the glass front of the stand on which it is placed. This exchange provides the telephone service to some of the principal exhibitors, and also to the call offices adjoining the main entrance. It represents a standard private branch exchange as supplied for large offices, warehouses, works, &c., an arrangement which has very great advantages when the extensions exceed a certain number. The switchboard is of the standard common battery type, equipped for two operators' positions, with 100 extension lines and 40 junctions to the main exchange. There are 15 cord circuits per position, with the usual "supervisory" or clearing signals, so that fifteen conversations can be going on simultaneously. The extension lines are arranged to call automatically when the receiver is lifted from the hook, the signal being received on the magnetic visual signal on the switchboard. The junction circuits are arranged so that they may be used either for outgoing or incoming calls. A battery of eleven separate cells supplies the current both for speaking and signalling purposes, and it is charged from special power leads from the main exchange. The usual lightning arresters, heat coils, &c., have been fitted.

Stand of Robertson Electric Lamps, Ltd.

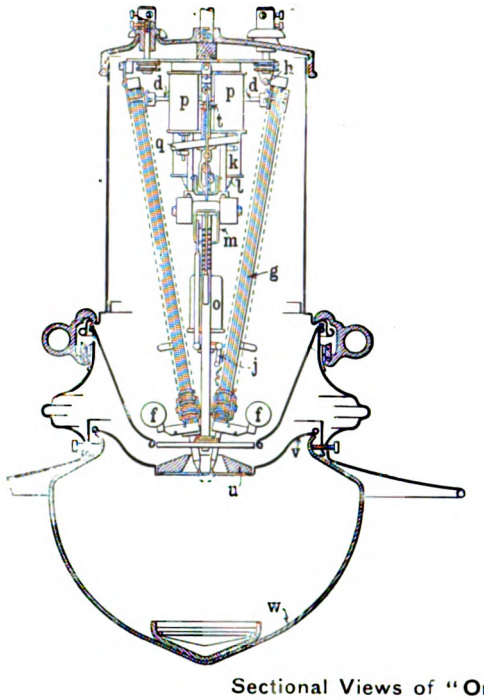
Oliver Arc Lamp, Ltd.,

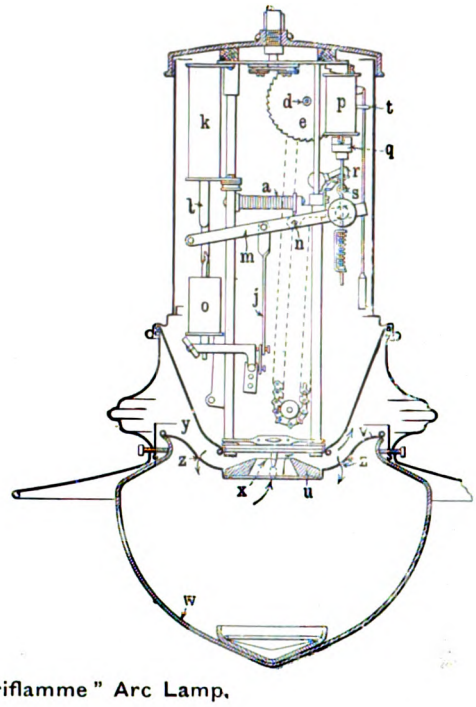
CAMBRIDGE PLACE, BURRAGE ROAD, WOOLWICH.
(STAND NO. 143.)

Arc Lamps and Accessories.—Several examples of the "Oriflamme" magazine open flame arc lamp are exhibited. The magazine holds from six to nine pairs of carbons, and by this means the lamp has a burning life of from 36 to 40 hours with each trim. The magazine containing the negative carbons is fixed, and that containing the positive carbons is pivoted for

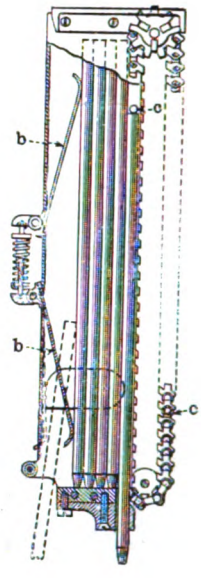
Digitized by Google

the purpose of striking and regulating the arc. The working of the lamp is illustrated in the accompanying figures, which show sectional views of the lamp, and the general arrangement of the magazine and feeding chain. Each magazine is provided with a carbon feeding chain *c*, and the two chains are worked simultaneously from a toothed wheel, *e*. The pawl engaging with this wheel is pulsated electrically by a small magnet, *p*, whose circuit is closed by means of a rocking mercury switch, *r*. The racking down of the carbons goes on at regular intervals, and when a pair is burnt out, the ends are discharged into the globe, and a new pair immediately moved into position. The changing of the carbons occupies about 20 seconds, during which period, of course, the lamp is extinguished. In the drawings we give above, *k* is the differential controlling solenoid; *a* the magnetising coil for the blow-out field; *p*, *p*, the magnet driving the ratchet feed; *g* the magazine, which is pivoted, and is moved by means of the rod, *j*; *m* the rocking arm; *f* the counterweight on the loose piece on the carbon holder; *w* the fireclay plate through which the fumes from the arc pass; and *b*, *b*, the levers pushing the carbons forward, the wire spring for controlling which is to be seen outside the magazine. The "Oriflamme" lamp is made in three standard sizes for continuous current, namely, 7, 9, and 11 amperes, with 34 volts across the terminals. On alternating-current circuits the lamps are burnt singly with choking coils; but on a continuous-current 200-volt circuit five may be burnt in series, with a consumption of 360 watts per 9-ampere lamp. The cost of carbons is said to be only 0·11d. per lamp-hour. Twenty-eight "Oriflamme" lamps are in use for the general illumination of the Exhibition.





Sectional Views of "Oriflamme" Arc Lamp.



View of Magazine.

Parmiter, Hope, & Sugden,

Hulme Electrical Works, Hulme, Manchester. (Stand Nos. 135 & 159.)

Iron-clad Switches.—In addition to their standard designs, a number of new patterns of iron-clad switches are shown by this firm. One of these is a patent "spring on" switch fuse, which is manufactured either two- or three-pole, and is suitable for 600-volt circuits. The main features of this new switch, a view of which we are able to publish, are as follows:—The operation of the switch is independent of the handle, and both make and break are as positive and quick as possible; the breaking of the switch is not dependent on the spring, but has a mechanical "kick-off"; the switch can only be left either full-on or full-off; the case is gas tight; and, finally, the cover is interlocked with the switch to comply with the Mining Regulations. As the operating mechanism is in the lid, the fuse contacts are necessarily in a position clear of all live parts when it is open to renew the fuses. The fuses, which are easily replaceable, may be either of the renewable or cartridge type. Several examples of the "Ajax" combined switch and fuse boxes, including those with the switch handle on the side of the box and not projecting through the cover, are exhibited. Among the other exhibits is a new form of aluminium lamp-reflector, mounted upon a portable stand, and intended particularly for use in drawing offices. The reflector and lamps can be removed from the stand and used as a drying lamp.

Arc Lamps.—A number of open flame and enclosed arc lamps and accessories are exhibited on this stand by the Gilbert Arc Lamp Co., Ltd., of Chingford, who are represented in Lancashire and Yorkshire by Messrs. Parmiter, Hope & Sugden. The most important item is an example of a multi-carbon lamp. This type of lamp, which we illustrate below, has lately undergone many improvements in connection with the operating mechanism. As can be seen from the illustration, there are five pairs of converging carbons, which give a burning life of from 50 to 65 hours on one trimming. Although called a magazine lamp, there is really no true magazine, as the arc continually shifts from one pair of carbons to another, and

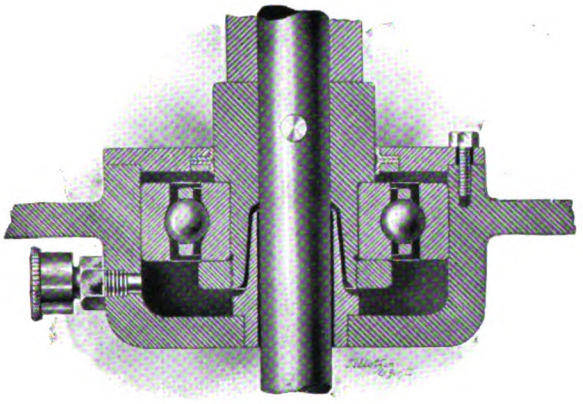
BALL BEARINGS



Electrical Exhibition, Manchester.

Stand No. 126/165.

THE HOFFMANN MANUFACTURING CO., Ltd., CHELMSFORD.

HOLDEN & BROOKE LTD.

"Parallel Flow" Oil Separators.
(Brooke's Patent.)

Highest Efficiency.

See List 127 E.

Without loss of Vacuum.

For freeing from oil or grease exhaust or other steam, as when condensing.

"High Velocity" Feed Water Heaters.
(Brooke's Patent.)

Heating Feed Water, &c., by Live or Exhaust Steam, or (as illustrated) by both.

Feed Water brought up to practically *Boiler Temperature* itself.

By our "High Velocity" System far greater heat is obtained than by any other.
See List 156 E.

Leinert's Liquid Meters.
(Patent.)

Free from Complications.

Action and all parts visible.

See List 144 E.

Automatically measure and record (by actual weight) Water, Oils, and other Liquids. Accuracy not affected by changes in temperature and specific gravity of liquids dealt with.

Automatic Vacuum Dischargers.

See List 72 E.

For automatically draining and discharging water or other liquids from any Chamber under Vacuum, such as Oil Separators, Exhaust Steam Pipes, &c.

Steam Dryers.
(Brooke's Patent.)

See List 140 E.

No rivets.

No leaky seams.

The *only ones really reliable* with *high pressures* and *superheated steam.*

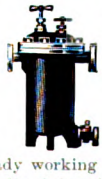
Injectors.

See List 137 E.

For all pressures and for *Hot Water.* Started and regulated by *one movement.*

Steam Traps.
(H. & B.'s Improved.)

See List 126 E.



Renewable Valve Seat.

Automatic Self-Grinding Valve.

Steady working with definite intermittent discharges.

Also Manufacturers of: PUMPS, COMPRESSORS, "PROTECTED SEAT" VALVES, EXHAUST HEADS, WATER LIFTERS, EJECTOR HEATERS, SIRIUS TRAPS, INJECTORS FOR ALL PURPOSES, &c., &c.

Sirius Works, West Gorton, MANCHESTER.

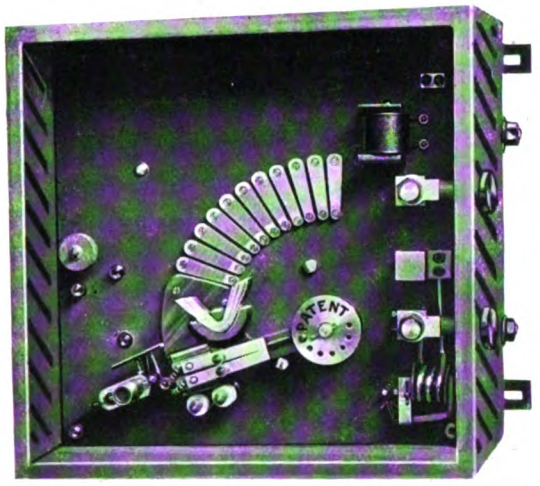
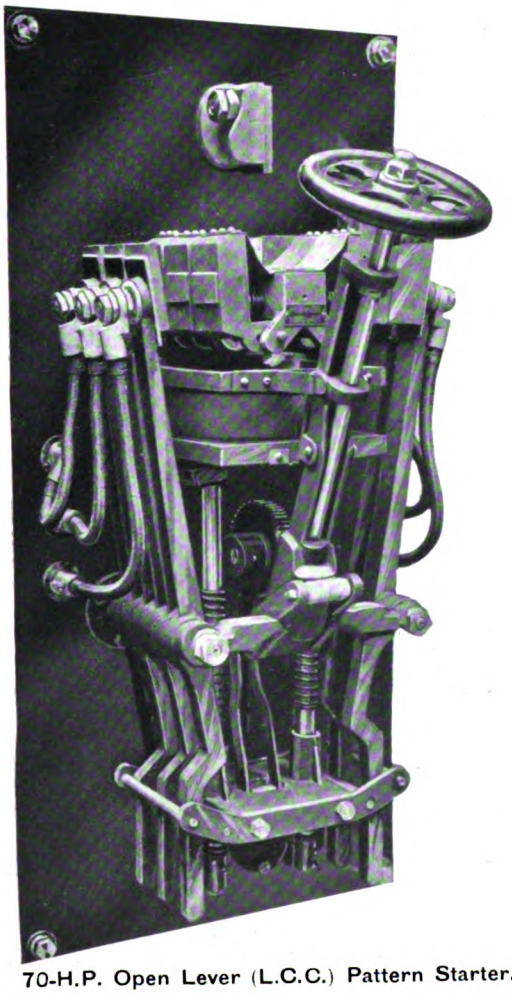
the latter are fed down together, and not in succession. A new feature in the lamp is the provision of a subdivided economiser, which, by preventing the burning of carbons by an adjacent arc, considerably lengthens the burning life. The change-over from one pair of carbons to another is almost



Motor Starter with Renewable Contacts and Adjustable Spring.

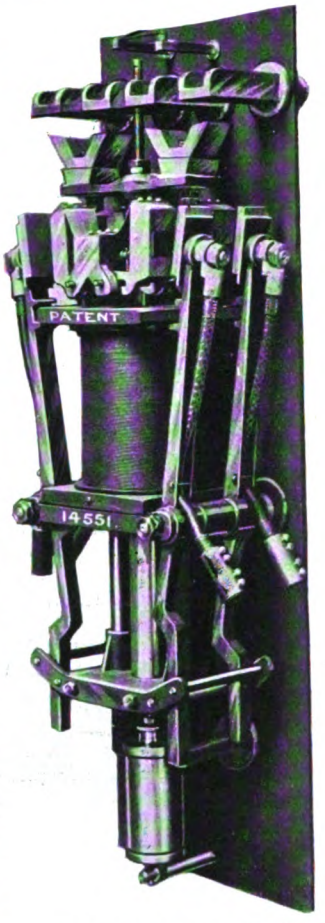
instantaneous, and is hardly noticed. Eight of these lamps are used to illuminate the roadway between the Exhibition and the main road. Several examples of the firm's standard patterns of enclosed arc lamps are shown, and among these is a new ornamental three-ampere lamp, with an overall length of only 18 in., and provided with a handsome spun copper case, bronzed



70-H.P. Open Lever (L.C.C.) Pattern Starter.

and relieved. The accessories exhibited include the firm's raising and lowering gear, the contact hood for which is fitted with an extremely simple automatic catch, and their well-known automatic switches for inserting incandescent lamps in circuit in case of the failure of an arc lamp.

Motor Starting Switches.—The Premier Electric Control, Ltd., of London, also represented in Lancashire and Yorkshire by this firm, exhibit a selection of motor starting switches and controlling rheostats in which are embodied a number of interesting features. One of these is the use of renewable contacts on the switch arms; another is the employment of a brass hook or catch on the lower pole of the no-voltage release magnet, in consequence of which the necessary pull of this magnet is considerably reduced. This can be seen in the illustration given on this page. It will also be noticed that provision is made for regulating the tension of the switch arm spring, and that the pressure of the brush on the contacts can also be adjusted. The use of a lid in preference to a box-shaped cover is also a feature of these switch boxes. A large lever rheostat of the pattern supplied to the London County Council's tramway sub-stations is also shown. This switch, which we also illustrate, is fitted with a slow action worm-gear, has no sliding contacts, and has a carbon make and break on each step.



200-H.P. Automatic Starting Switch.

Automatic Motor Starters.—Yet another firm, namely, Electric Control, Ltd., of Glasgow, are represented by Messrs Parmiter, Hope & Sugden, and exhibit on this stand. The apparatus shown, comprises a representative selection of automatic starters for direct-current motors, one of which, a 200-h.p. starter of special design, we illustrate here. These starters have only one solenoid, and there are no sliding contacts, as each step of the resistance is cut out by a separate lever with carbon contacts. In the larger sizes, the final contact is made by means of a laminated copper brush; this copper brush merely short circuits the carbon contacts. As the solenoid is shunted across the supply mains, it operates as a no-voltage release. The most interesting item of this firm's exhibit, however, is an automatic starter for alternating current. This is for a 100-h.p. 400-volt, 50-cycle, three-phase induction motor. It comprises one primary switch, three switches for cutting out rotor resistance, and a large switch to finally short circuit the rotor. Owing to improvements in the mechanical design, these solenoids operate with practically no noise, and by a special spring action, chattering at the carbon contacts is quite impossible. The design of the alternating-current starters is similar to that of the direct-current starters in that there are no sliding contacts.

A. G. Thornton, Ltd.,

PARAGON WORKS, KING STREET WEST, MANCHESTER.
(STAND NO. 222.)

Blue Printing Device, Drawing Instruments, and Slide Rules.—This firm shows one of the convenient apparatus for printing blue prints, which are gaining considerable favour. An arc lamp, which moves up and down, vertically, is surrounded by a canvas screen rotating close to a glass cylinder. The tracing and printing paper are fed into this, and rotate past the lamp, and an exposure of very little over a minute is sufficient to print an ordinary blue. The machine is driven by a small motor, and the reciprocating motion of the lamp is actuated by a simple chain and crank action. The firm also exhibits an ingenious self-filling drawing pen, and a pen spring bow, in which the pen is vertical instead of sloping. Among the slide rules are the Perry slide rules, in which work can be done in fractional indices, and also a very neat 5-in. slide rule with a magnifying cursor, in which the scale is arranged in precisely the same way as an ordinary 10-in. slide rule.

Digitized by Google

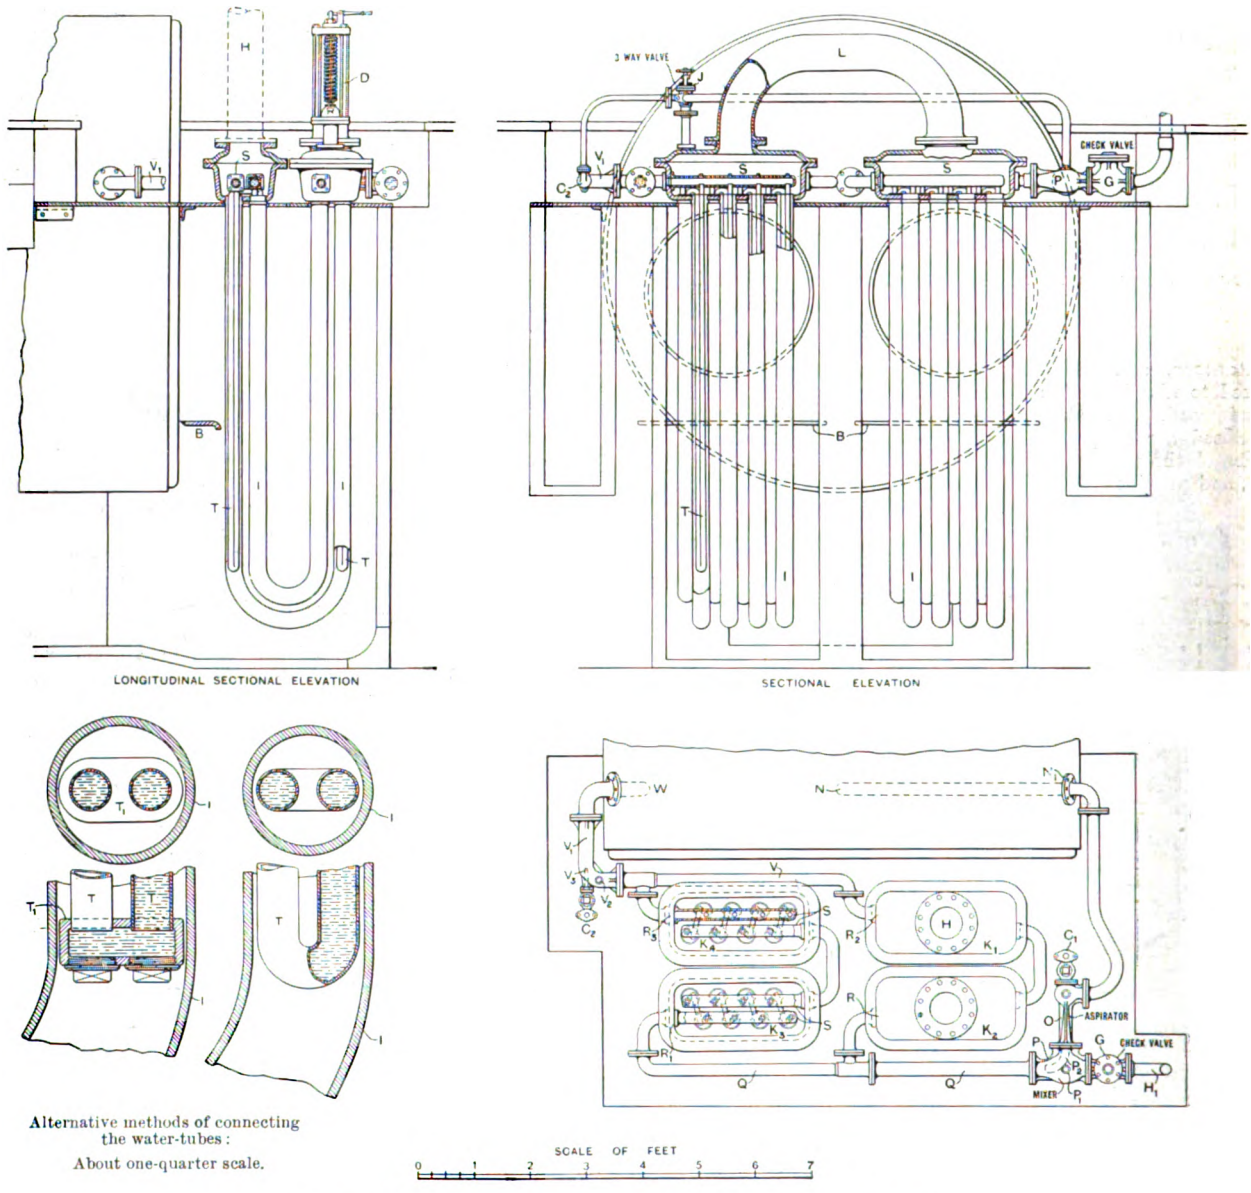
John Musgrave & Sons, Ltd.,

Bolton, Lancs. (Stand No. 53.)

Zoelly Turbine.—The central feature of this stand is a 600-kw. Zoelly turbine driving a 500-volt, 50 cycle, three-phase Siemens generator. This machine is identical in every respect with the one described in detail in our issue of September 24th, and in use at the Falcon Spinning Mill—in fact, it is destined for this mill at the close of the Exhibition. It is driven by an electric motor for the purpose of showing how perfectly balanced it is, and also to show the operation of the governor, oil circulation, &c.

Barring Gear.—There is also on exhibition an electrically-driven barring gear, which has been manufactured for use in conjunction with a slow-speed vertical cross-compound engine of 4,000 i.h.p. maximum output, made for the City of London Electric Lighting Co., Ltd., for their Bankside station. This will make the seventh engine of this size and type manufactured by Messrs. Musgrave & Sons for the Bankside works. The motor is a 25 b.h.p. machine running at 500 r.p.m. The gear is knocked out automatically when the speed of the fly-wheel catches up the speed at which the barring gear is driving it.

Cruse Superheaters.—Messrs. Musgrave have now taken up the manufacture and sale of these superheaters under licence from the inventor and patentee, Mr. Henry Cruse, who claims for his superheater that it is more efficient than any other pattern. They are exhibiting one of the larger types of "controllables," as adapted to Lancashire boilers up to 30 ft. by 9 ft., with double bottom boxes. We illustrate below a modified and less expensive type applicable to both the Lancashire and the water-tube type of boiler, a drawing of which is also shown on Messrs. Musgrave's stand. The object of the Cruse superheater is to afford accurate temperature control, and the firm is prepared to guarantee that the temperature shall never differ by more than 25° F. from the prearranged temperature. This is arrived at by passing a stream of water through a second set of tubes within the steam tubes of the superheater. A part of the feed water is employed for this purpose, but so that the temperature shall be kept constant even when the boilers are not being fed, an automatic aspirator arrangement, working on the principle of an injector, is employed to supplement this. The steam from the boiler junction valve enters the superheater at H; it travels through the outer weldless steam tubes I and pressed steel boxes K the whole length of the superheater. In its course it passes from the front box K^1 through the looped tubes I to the top box K^2; from box K^2 it travels by means of weldless steel connecting bend L to back box K^3, and from this box, through the looped tubes I, it enters front steam box K^4, which it leaves at M for the engine, superheated to the required temperature. Circulating water rises through a trunk or bent pipe N from the bottom of the boiler, which it leaves at N^1—low water level. It enters, by gravity, the aspirator or superheated steam jet O, through which it is propelled with greater or less velocity according to the



Alternative methods of connecting the water-tubes: About one-quarter scale.

Cruse Superheater for Water-tube or Lancashire Boiler.

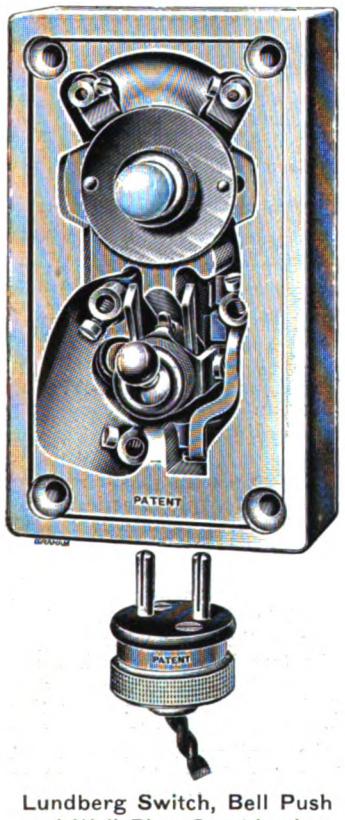
Digitized by Google

temperature of the superheat. The circulating water next enters the mixing box P, wherein it is met by and mixes with the feed water from the economisers. These combined streams of water now flow through pipes Q, and are fed at R and R^1 to the internal water or controlling system (headers S and loops T) inside the steam boxes K and steam tubes I, in two parallel streams flowing from back to front of the superheater, as shown in the illustration. The water leaves the superheater at R^2 and R^3, and, after again uniting in pipe V, is returned to the boiler through bend and accelerator V^1, at W. The body of water during its travel through the internal tube system of the superheater will have controlled and regulated the temperature of the superheat added to the steam, and will in its turn have been reheated during the process, approximately, to the full temperature of the saturated steam in the boiler, according to the pressure. It will be noted that this apparatus consists of two independent superheaters working in series; both may, however, be made to work in parallel. The water system may also be made to work in four parallel series instead of two.

The Sunbeam Lamp Co., Ltd.,

Gateshead-on-Tyne. (Stand Nos. 200 & 201.)

Lamps.—A selection of "Sunbeam" tungsten filament lamps are exhibited in all positions, for pressures up to 250 volts, and of various candle-powers up to 100 c.p. These lamps, as well as the glass bulbs, are British made. Large carbon filament lamps for radiators, advertising signs (including a "winking-pup") and "turn-down" double filament carbon lamps are also exhibited. These latter are adapted for use in an ordinary fitting, but they have a collar and a length of flex, to which is attached a two-way pear-switch. The candle-power can be reduced from 16 c.p. to 2 c.p. by changing over to the small filament.



Lundberg Switch, Bell Push and Wall Plug Combination.

Fittings.—A novelty in the way of electroliers is the "Converta" fitting which is exhibited on this stand. This consists of an ordinary circular electrolier, with the lamps surrounded by a short hanging silk curtain. The lamp brackets are hinged, however, and can be turned round so that the lamps project radially outside the curtain when a stronger general illumination of the room is required. Many patterns of artistic electroliers, table, wall, and porch fittings are exhibited on this stand. These latter are designed and manufactured by Jesson, Birkett & Co., Ltd., of Birmingham.

Switches.—A show-case full of the "Lundberg" specialities is also exhibited on this stand. These include the new "Twinob" switch and the "Pixy" bell push, both of which we have described and illustrated in recent issues. Other novelties are the combination switches, consisting of one or two wall plugs, a switch and a bell push, all mounted on a single porcelain block, as shown in the accompanying illustration. A neat porcelain or metal cover is provided, and the whole can be arranged for surface or flush fixing. Another novelty in this line is the two-way "Tripin" combination switch. With the aid of this switch a single-way circuit can be converted to a two-way circuit without altering the wiring. The "Tripin" switch must be substituted for the ordinary tumbler switch, and then the lamp can be controlled either from this switch or from a pear-push or other switch connected to the "Tripin" switch. This should be useful in bedrooms where it is desirable to have control from two points, and where the wiring has already been arranged for a single way only.

New Gutta Percha Co., Ltd.,

Dashwood House, New Broad Street, London, E.C. (Stand No. 137a.)

Wires and Cables.—The company's cables and wires, insulated with Gutta Gentzsch and Pernax, have, we are informed, been supplied to many of the English railway companies during the past five years, but are now exhibited for the first time. The insulating material does not contain any gutta percha, but is a "gutta percha substitute," which consists of best Para rubber mixed with a waxlike material, previously treated by a chemical process, to give the requisite physical and mechanical characteristics. The material does not act on the wire, and there is no vulcanising process, so that the wire is not tinned. The dielectric thicknesses equal to those adopted by the Cable Makers' Association for vulcanised rubber cables have been adopted, but the price is considerably cheaper than for vulcanised rubber. Specimens of the wires are shown in water, salt water, dilute hydrochloric acid, and dilute sulphuric acid, and samples of sheet are also exhibited. The company's representatives inform us that they have been booking orders from several Corporations.

Marples, Leach & Co.,

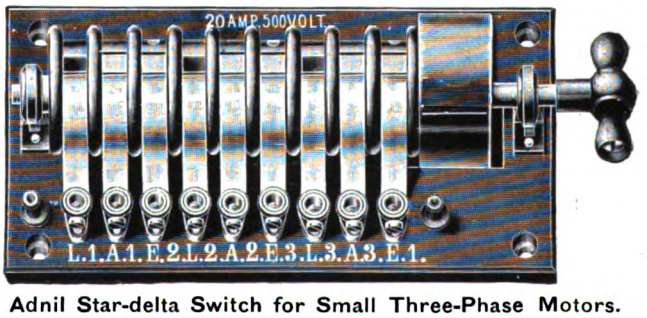
Artillery Lane, London, E.C.. (Stand Nos. 104 & 105.)

Motor Starting Switches.—Motor starting switches, it will have been observed, are a great feature at this Exhibition, and at Messrs. Marples, Leach & Co.'s stand this is no exception. The switch which we illustrate below is a compact and ingenious type of fool-proof combined starting and main switch. All the operator has to do is to put up the handle closing the main switch, and the contact brush moves up slowly over the starting contacts. The action of pushing up the switch compresses a helical spring, which actuates the contact brush against the action of glycerine dash-pot. A catch holds this down, however, until the handle has been pushed right home. It is thus impossible to move the starting switch until the main switch is closed, so that the motor can never be switched on except when the starting part of the switch is in its off position. This switch has been given the suitable name of the "Direkton." The illustration represents a 10-h.p. switch, about one-eighth full size.

"Direkton" Combined Main and Starting Switch.

Among the large collection of starters of various types, mention may also be made of the star-delta switch illustrated below. This is arranged for starting the motor, first by connecting the rotor in star and then in mesh. It is only possible to turn the switch in one direction, and it has the three positions—off, star, and delta. Its construction is clearly seen from the figure.

When motors are used for organ-blowing, trouble is often experienced through the organist not working the starting switch properly. An automatic arrangement to obviate this is



Adnil Star-delta Switch for Small Three-Phase Motors.

shown. The bellows are connected by a wire rope to the handle of a combined starting and regulating switch. The resistances in connection with this are heavy enough to take current continuously, and the motor is thus running at full speed when

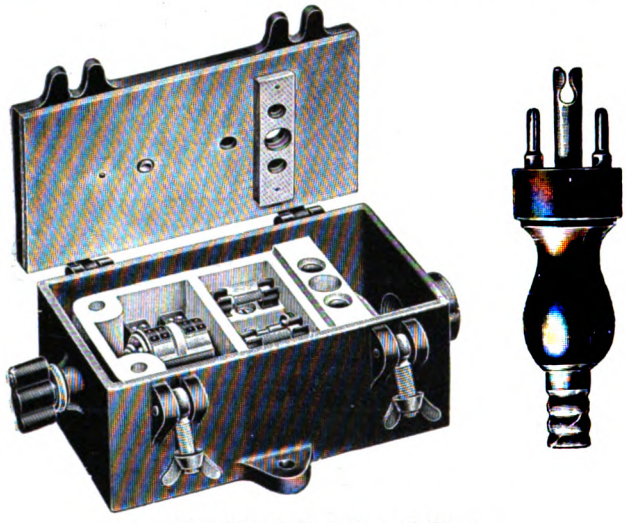
Digitized by Google

the bellows are empty, and gradually slows down when they are nearly full. A useful strong, oil-immersed auto-transformer starter for alternating-current motors is another exhibit on the stand. Another is a three-phase crane controller, the fingers of which have renewable tips.

Motors.—Some motors are shown in which, in place of an ordinary cast liner for the bearings, a hard rolled brass liner is employed, the grain of which is in the same direction as the rotation of the shaft. This is first shaped on a mandrel, then forced through a die, and, after being fixed in place, has a mandrel forced through it, thus making an exact fit with the shaft, which is ground true and not turned.

Among the very numerous motors shown, a particularly interesting one is the "Century" single-phase self-starting repulsion-induction motor. While the motor is running up to speed, the induced current in the armature is short-circuited through carbon brushes bearing on the commutator, and so situated in relation of the field as to control the direction of the rotation and the amount of starting torque. When full speed is reached a governor on the shaft of the motor acts and short-circuits all the commutator bars to one common ring, at the same time releasing the tension of the carbon brushes and pushing them back away from the commutator. The machine then runs as an induction motor. When the motor is stopped, the governor returns to its original position as the machine slows down.

Other Exhibits.—A fine sample board of Bergmann tubing for conduit wiring is shown, and also a collection of meters, including two-rate meters. The bell and telephone exhibits are very numerous, and frequent demonstrations of the quality of



Combined Switch and Plug.

a large motor-driven bell and hooter, are given for the benefit both of the visitors and the other exhibitors. The latter only appreciate these signals when they are sounded at 10 p.m. to indicate that it is closing time. A loud-speaking telephone is arranged in such a way that the loud-speaking receiver, which is in one with the transmitter, is in operation when the usual receiver is on the hook, but not when it is removed. A combined switch and plug, made for Admiralty purposes, is shown, arranged that when the switch is on the plug cannot be removed. On a small drilling machine the motor is fixed with the shaft vertical. One edge of the base is hinged to the standard of the machine. It is belted to the drill, and a screw bearing on the base of the motor at the opposite side of the hinge regulates the tension of the belt. A new arc lamp is also exhibited, called the "Reboja." Five lamps are burning across the 200-volt direct-current mains, and the lamp, which takes 10 amperes, only requires 30 volts across the arc.

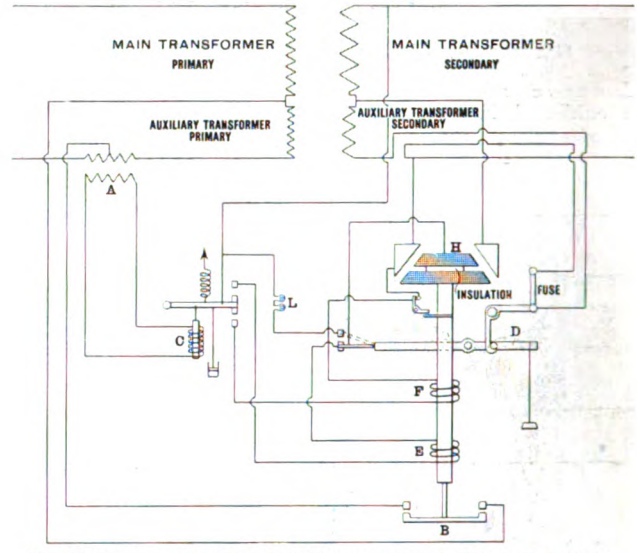
The New Electric Rifle & Target Co., Ltd.—53A Shaftesbury Avenue, London, W. (Stand No. 291.) Six sets of electric rifles and targets are shown, and can be used. The way in which these work is as follows :—Rigidly attached to the barrel of the rifle is a downwardly projecting rod, on the end of which is a needle. Immediately below the needle is a little cup divided into twenty-four compartments. When the trigger is pressed the cup rises, and the needle enters the compartment corresponding to the point on the target at which the barrel is aimed. Each compartment contains mercury, and is connected to a small lamp behind the corresponding point on the target; the needle completes the circuit, and the "hit" is indicated. The lamp remains alight only a few seconds, the time being controlled by a dash-pot.

Westinghouse Electric & Manufacturing Co., Ltd.,

Trafford Park, Manchester. (Stand Nos. 79, 81, 101 & 103.)

Motors.—The heavy machinery manufactured by this firm is represented by the 700 kw. rotary convertor and the three 250 kw. transformers at the Exhibition sub-station, which we have already described. On their stand this firm exhibits a rainproof ventilated motor shown in operation under a spray of water. A continuous motor of the same type, but for forced ventilation, and a semi-enclosed motor with openings protected by a double thickness of fine wire gauze, for use in carpenters' shops, are also shown. Several examples of the firm's unit type resistance starters, in which each unit consists of a coil of Eureka wire totally embedded in steatite and entirely fireproof and incorrodible, are to be seen.

Series Transformer Switch.—Perhaps the most interesting exhibit is a new automatic transformer cut-out for the same purpose as the "Berry" series transformer switch, which we described fully in our issue of February 6th, 1903. The object of this switch, which is used in conjunction with two transformers, a large and a small one respectively, is to short-circuit the small transformer, which is in series with the large one, when



Westinghouse Automatic Transformer Cut-out 2-Wire Series System.

the load becomes too much for the former. In the Westinghouse arrangement, the relay which controls the short-circuiting switch is operated from the secondary of a special series transformer. The advantage of this is that the relay only has to carry a small low-tension current. As shown from the diagram which we give below, a lead is brought out from some point in the primary winding of the series transformer A, and carried to one terminal of the high-tension switch B. When the switch is open, the current passes through all the turns in the primary winding of the series transformer, but when the switch is closed a certain proportion of the turns are cut out. By this means one of the chief difficulties encountered in this system, namely, that the relay coil must operate accurately with the full load current of the auxiliary transformer, but must not burn out when perhaps ten times this current is flowing is overcome; as by cutting out part of the turns of the series transformer, the current through the relay coil C is very considerably reduced. The series transformer, which supplies the relay coil, has a small magnetic section, so that when the current exceeds a certain value, the magnetic circuit is saturated, and the increase of current through the relay coil is not proportional to the primary current. The diagram which we give shows also the mechanical arrangement for closing the switch in the event of anything going wrong with the electrical circuits. This consists of a weighted lever D held in position by a trigger, which is in turn secured by a fuse in series with the primary or secondary of the auxiliary transformer. In the event of the fuse blowing, due to an overload of the auxiliary transformer, the trigger is released, and the lever moves upwards, and thus closes the switch. In order to prevent the opening coil E from operating to open the switch after the fuse has blown, a contact is placed at one end of the lever arm, so arranged that when the lever moves upwards the circuit through the opening coil is opened, and at the same time a circuit is closed through one or more lamps L, which serve as a signal to indicate that the fuse has blown. In the diagram which we give above, the auxiliary transformer is taking the

BEFORE leaving the MANCHESTER EXHIBITION you MUST visit STANDS Nos. 104/5 and inspect the following Specialities :—

"Adnil" Signalling Apparatus.
"Adnil" Loud Speaking Telephones.
"Adnil" Flame Arc Lamps.
"Adnil" Metal Filament Lamps.
"Adnil" Automatic Starting Gear.
"Adnil" Dynamos and Motors.

Marples, Leach & Co., Ltd.,

ADNIL BUILDING, ARTILLERY LANE, BISHOPSGATE ST. WITHOUT,

Telegrams : "ADNIL, LONDON." **LONDON, E.C.** Telephone : London Wall, 3840 (4 lines).

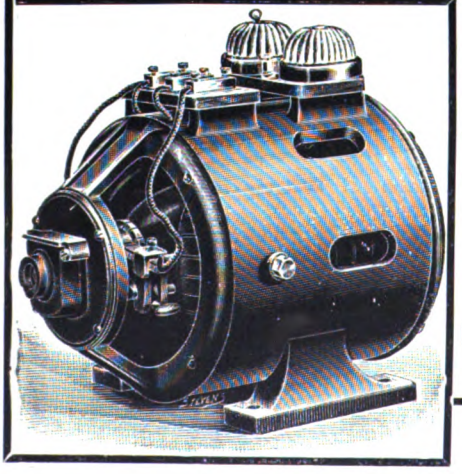
—CRYPTO— ELECTRICAL SPECIALITIES

For ABSOLUTE SATISFACTION it is advisable that you have **"CRYPTO"** Dynamos and Motors.

DON'T INSTAL A MOTOR YOU FEEL DOUBTFUL ABOUT. Let it be one you are confident will give satisfaction.

You can rely on the **"CRYPTO."**

MAY WE QUOTE YOU?



When you visit MANCHESTER don't forget **Stand 302**

THE **CRYPTO** ELECTRICAL CO., 155 & 157, Bermondsey St., LONDON, S.E.

H. WEIDMANN,

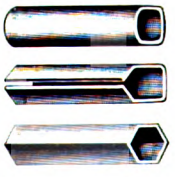
RAPPERSWIL, SWITZERLAND.

MANUFACTURER OF PRESSBOARD AND INSULATING MATERIAL.

SPECIALITIES—

PRESSBOARD in Sheets, Rolls and Tapes, Pressboard-tubes and stampings.
AMIANITE (vulcanised Asbestos), Coil Frames, Bobbins for Dynamos, Motors, and Transformers ; Boxes, &c.; Insulating Blocks ; Tubes ; Plates.
CORNITE (high-tension material), Handles for Switch-gear and heating apparatus, controller insulation, moulded parts of all kinds.
ASBESTOS-CEMENT in plates, for controllers, &c.
CALICOT and JACONNET TAPES.
Oil-varnished LINEN, SILK and PAPER.
Mica and Substitutes.

All kinds of Insulating Materials.



GRAND PRIX

Electrical Exhibition, Marseilles, 1908.

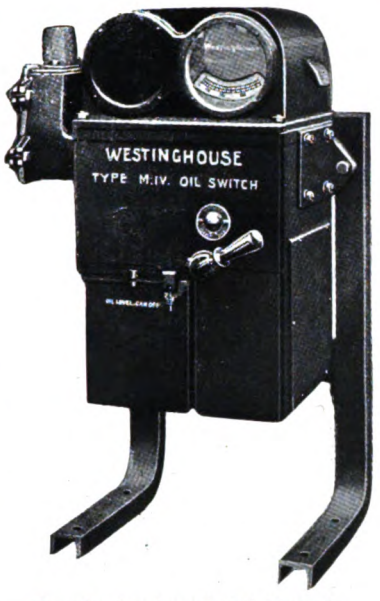
load. Should the load become too great the relay coil completes the closing coil circuit, and the low tension switch H is closed. This, as can be seen from the diagram, short-circuits the secondary of the auxiliary transformer, and the high-tension switch B attached to the other end of the plunger short-circuits the primary of the auxiliary transformer, and also a few turns of the relay series transformer, which last prevents the overheating of the relay coil as explained above.



Totally Enclosed Oil Switch.

Instruments.—A new type of "edgewise" switchboard instrument is exhibited. The "V" form of the scale allows readings to be taken from practically any position in front of the switchboard. Among the meters is a new pattern of single-phase watt-hour meter. It has been designed to give accurate readings with very low power factors, and the five-ampere 220-volt size is said to start with a load as small as four watts. It should, therefore, be useful for small transformer installations.

Switchgear.—The exhibit of switchgear includes an interesting inverted type switch pillar for use in mines. All the movements are interlocked; the door cannot be opened for inspection when the isolating switch is on, and the isolating switch can neither be opened when the coil switch is closed, nor closed when the door is opened. Another interesting oil switch, in which the oil tank is detachable without dismantling the switch, is shown. The switch itself is loose-handled and fitted with automatic no-volt and overload devices. An ammeter and a voltmeter can be fitted in the hood of the case. The maximum breaking capacity of such a 3-pole switch is 1,200 kw., and the pressure can be anything up to 3,300 volts.

Solenoid Operated Circuit Breaker for Remote Control with Magnetic Blow-out.

A mining panel consisting of flame-tight and explosion-proof switch and fuse boxes for A.C. or D.C. pressures not exceeding 600 volts is also shown. The boxes are ribbed in the interior to make them strong enough to withstand an internal explosion, and an important feature in the design is the provision of a "V"-shaped metal projection on the underside of the rim of the cover, and a corresponding "V"-shaped groove in the rim of the base. The gap between the two provides a long and narrow path from the inside to the external atmosphere, and any gases escaping after an explosion are cooled before they reach the exterior of the box. The switch and the boxes are interlocked in the usual way.

An auxiliary fitting which has recently been designed for use in power stations where space for the extension of the switchgear is limited, is exhibited; this consists of a double-acting solenoid and plunger, which can be fitted to the standard pattern circuit breaker enabling the latter to be operated from a distance by means of a small switch. The solenoid has two separate coils to produce the double action of opening and closing the switch respectively.

A starting switch for squirrel-cage induction motors is shown; this has four positions, namely, off, star connection, delta connection, and delta connection with the fuses in circuit. By keeping the fuses out of circuit when starting, they can be made of a size to give good protection for the motor without fear of their being blown on starting.

Henry Wallwork & Co., Ltd.,

UNION BRIDGE IRON WORKS, ROGER STREET, MANCHESTER.
(STAND NO. 42.)

Worm Gears and Gear Cutting Machines.—Two fine examples of gear-cutting machines should not be overlooked. The first of these is a gear-cutter for generating spurs, worm wheels, and spirals with hobs, and is direct geared to a 3½ h.p. motor with a raw-hide pinion. All the movements of this machine are through hollow-faced spiral gearing running in oil. It will take a 36-in. wheel, and can cut a maximum pitch of 2½ D.P. in steel. The second machine, also for generating worm wheels, is fitted with a tangential feed of the cutter employing either a hob or a fly tool. An example of worm gearing, for use in the electric driving of lead-rolling mills, is also exhibited. This has a speed reduction of five to one, and is said to be capable of transmitting 96 h.p. with an efficiency of 90 per cent. The rim of the wheel is of phosphor bronze, but the worm is of forged steel, hardened and ground. Worm and wheel are enclosed in a case which, however, is cut away to show the worm. A number of standard patterns of twenty to one reduction worm gears, mounted on bedplates, with electric motors of various outputs, are also shown. These have either ball bearings or ring self-oiling bearings. The thrust of the worm is taken by a double-ring Hoffmann ball-bearing. With multiple-thread gears, a single or double thrust bearing is mounted on the wheel shaft, according to whether the wheel is to run in one direction only or in both. A large and varied selection of malleable iron castings is shown, among which are to be found resistance grids, tramway fittings, and fuse-box covers. Aluminium, gun-metal, and brass castings are also exhibited, together with patterns in both wood and iron.

Wallwork Semi-Portable Lamp-Bracket.

Adjustable Lamp Brackets.—The patent universal electric lamp brackets manufactured by this firm can also be seen on this stand. These brackets are suitable for both office and workshop use, and can be obtained in iron, nickel plated, or of solid brass. A large number of different patterns are made, and they can be adopted for use in any position. They are provided with from one to three arms, and either a table stand or a rosette for fixing to wall or ceiling as desired. A useful development of this bracket, in the form of a semi-portable lamp bracket, for fixture to work bench, marking out, or tool table, is illustrated

Digitized by Google

above. These lamp brackets are strong, steady, and well made, and the long list of firms using them, given in Messrs. Wallwork & Co.'s circular, is a striking testimonial to their utility and reliability.

Buffoline Noiseless Gear Co., Ltd.,

Chapel Street, Levenshulme, Manchester. (Stand No. 106.)

Pinions and Gears.—"Buffoline" pinions are exhibited, and also blanks in the rough, from which the pinions are cut out by milling machines. The material is buffalo hide, which is built up under hydraulic pressure. It is suitable for exhibition purposes, owing to its noiseless running, which recommends this gear for every other class of work as well. It is claimed that its wheels are rather more durable than paper, and that they run even quieter. In addition to the wheels shown at the company's own stand, Buffoline gears are used in connection with the exhibits of Electromotors, Ltd., F. Pearn & Co., Ltd., William Matthews & Co., Ltd., Pollock & McNab, and Marples, Leach & Co. The company also show a 32 : 1 worm reduction gear for hoists, &c. The worm is of case-hardened steel, and the wheel of phosphor-bronze, and, although very compact, it is capable of transmitting 150 h.p.

William Matthews & Co.,

Brookside Works, Moston Lane, Manchester. (Stand No. 106.)

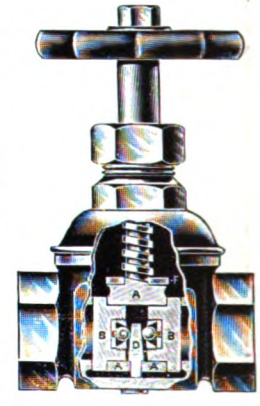
Pumps.—A large pump shown on this stand is for deep bore-holes, and is arranged for driving by sweep crank gearing and electric motor. Similar types of headgear are driving the firm's bore pumps in various parts of the country and pumping quantities up to 50,000 gallons per hour from depths varying from 50 to 300 ft. The bedplate of the pump exhibited is 16 ft. 6 in. long over all, by 7 ft. wide, and weighs 3½ tons. It has a motor base cast with it, designed for carrying two sizes of motor, the reason being that if at any future period it is found necessary to place the pump deeper in the bore-hole, a larger motor may be attached without necessitating any extensive structural alteration. The gearing consists of a first reduction gear, machine-cut wheel 6 ft. diameter, which weighs roughly one ton, and one "Buffoline" raw hide pinion of special wearing quality. The motor is one of the Lancashire Dynamo & Motor Co., Ltd., 55 b.h.p., 570 r.p.m., 50 cycles. The crankshaft gearing is of the double helical type, made up of two large machine-moulded helical wheels, each 7 ft. diameter, and two pinions, shrouded to the top of the teeth. The crankshaft is of Siemens-Martin steel, 6¼ in. diameter in the neck and 7 in. in the bearings, highly finished, and weighing about 25 cwt. A ram, trunkslide, connecting rod, and stand pipe, also shown on the stand, are designed to work in conjunction with the gearing, the ram having a crosshead cast with it, and worked by the connecting through the trunkslide being coupled up at the bottom end to the pump rod with a socket and cotter joint. The pump consists of a cast-iron barrel, 12 in. diameter, 36-in. stroke, truly turned and bored to receive a cast-iron bucket and foot valve, both of which are fitted with the firm's latest design of "double beat" metallic valves. The total weight of the whole pump and gearing when finished will be very little short of 30 tons, and is part of an installation for Messrs. J. & P. Coats, Ltd., of Paisley, Glasgow. The firm is prepared to put bore-holes down of any diameter, from 3 in. to 40 in., and to any depth.

Dr. Heinr. Traun & Sons, 8 Redcross Street, London, E.C. (Stand No. 192.) *Moulded Ebonite.*—Numerous samples of moulded ebonite are shown, which demonstrate to what an extreme accuracy this firm can mould it. Pieces of telephone apparatus, &c., which would require a great deal of work to drill and cut, involving also considerable waste of material, are shown, perfectly finished. Very many parts of telephone apparatus are exhibited, including base plates with even the narrow slits for the wires moulded, and also high tension distributor, &c., for motor-cars. The latter are moulded in a special ebonite of a brown colour, which has heat-resisting properties. Pumps for acid, made completely of ebonite, are exhibited, and also accumulator boxes, and strain insulators and other accessories for overhead trolley work. We are informed that a test of Messrs. Heinr. Traun & Sons ebonite sheet made at the Physikalisch-Technische Reichsanstalt showed a tensile strength of 7 kg. per sq. mm., a specific gravity of 1·16, and a disruptive voltage of 50,000 volts per millimetre thickness.

Small & Parkes, Ltd., Hendon Vale Works, Harpurhey, Manchester. (Stand No. 10.)—*Packing and Belting.*—This firm shows ten different varieties of their "Karmal" packings. They claim that this material is self-lubricating so long as there is a fibre of it in the box. In addition to packings for all steam pressures, the material is also supplied for pumps, elevators, accumulators, hot water, and various special purposes. The makers claim that this is the only lubricating packing on the market that will work with water at 212° Fahr. They also exhibit their patent "Roko" belting, which has an edge designed to prevent fraying, and a pile surface to take up all the jambs and strains and to save the body of the belt from wear and tear. These belts are said to show a minimum of cracking and stretching, and at the same time to have an exceedingly good grip.

W. H. Roy & Co., 30 Spring Gardens, Manchester. (Stand No. 248A.)—This firm shows sections of a cooling stack, of which they make a speciality. The cooling laths are securely fixed at each end, and rigidly supported at the centre of their length, and no nails are used. They are fitted with dripper bars designed to distribute the water accurately from the gutters to the top tiers of cooling laths in place of the ordinary system of distribution of V notches, so that there is no trouble from the notches being choked with sediment. The water flows through a square notch along the top of the bar, and falls off in regular drops on to the upper edges of the top tier of laths. A photograph is exhibited of a cooling tower supplied to the Huddersfield electricity works, capable of dealing with 500,000 gallons per hour. There is also a drawing of a central jet condensing plant supplied to the Lancashire & Yorkshire Railway Co.'s Horwich locomotive works by the Mirrlees Watson Co., with open type towers, built by Messrs. Roy. Drawings and photographs of Reid's patent oil separators are shown. Cases have arisen in which silt is carried over from the boilers into the wheel chambers of turbines, and it is suggested that a separator of the Reid type, modified to deal with live steam temperatures, should be employed in cases where this danger is anticipated.

J Shaw & Son, Ltd., Albert Brass Works, Huddersfield. (Stand No. 140.) *Valves and Fittings.*—In the valve illustrated the discs are pressed to the seats by a wedge *D* operating on the ball-bearings *C*, *C*, which are fixed in the centre of the discs. This method, the makers claim, is preferable to the usual spring system. The special packing ring *F* on the spindle forms a steam-tight joint when the valve is open, apart from the packing in the stuffing boxes. Messrs. J. Shaw & Son also make a special alloy, which they call "Nico," intended to stand extremely high superheats without cutting.



Shaw Patent Parallel Valve.

Brunner, Mond & Co., Ltd.—Northwich. (Stand No. 129.) *Chemical Products.*—This firm exhibit a collection of samples of chemical products used in the electrical and engineering industries, including pure zinc for batteries, &c., and rods of pure cadmium metal. Attention should be drawn to the compressed tablets of ammonium chloride for Leclanché cells, known as voltoids, and other forms of this material for galvanising, soldering, and other purposes.

W. H. Perkins.—Cowlishaw Street, Manchester. (Stand No. 289.) *Pattern Shop Equipment.*—Two or three examples of pattern-makers benches are shown, and also some patent vices and routers.

The "Clipper" Belt Hook Co.—251 Deansgate, Manchester. (Stand No. 300A.) *Belt Fasteners and Ceiling Clips.*—This firm is exhibiting a selection of their belt tools and hooks, including a new form of fastener called the "Clipper Cable," which is intended for use when the belt cannot be easily taken down from its running position. It is a simple fastener in one piece, and no tool is required for fixing, except a punch for making the necessary holes in the belt. Girder clips made of narrow steel strip and intended for fixture to ceiling girders are also shown. These clips merely grip the girder flange, and no screwing or tapping is necessary to fix them.

The Kearney High-Speed Railway.—17 Old Queen Street, Westminster, London, S.W. (Stand Nos. 245 & 250.)—A working model of this railway system, the principle of which we described in our issue of June 18th, 1908, is exhibited. Mr. Kearney is personally demonstrating and explaining the system.

SUMMARY

Our account of the principal exhibits at the Manchester Exhibition is continued in the fifth of our series of special supplements which accompanies this issue.

A letter from Messrs. Handcock & Dykes deals with the relative importance of commercial and engineering problems as subjects of discussion for an engineering institution, and one from Mr. W. A. Toppin comments on systems of charging for electrical supply. (Page 582.)

The annual dinner of the Institution of Electrical Engineers was held last Thursday at the Hotel Cecil. About 400 persons were present, including a number of the delegates to the International Conference on Electrical Units and Standards and the International Electrotechnical Commission. The speeches turned largely on the inter-relations of science and industry and the standardisation work of the two Congresses. (Page 582.)

Some interesting notes and suggestions with regard to wiring for 25-volt lamps are contributed by Mr. A. H. Dykes. He compares the relative advantages of the balancer transformer, the auto-transformer, the ordinary double-wound transformer, and the transformer with a three-wire secondary, pointing out that with the two former systems the insulation of the installation has to be strong enough to withstand 200 volts. With the ordinary transformer he suggests using concentric wiring with uninsulated return, and as a development of this a transformer with a tapping from the centre of the secondary and wiring on the three-wire system with the conduit as the neutral wire. (Page 583.)

On Friday last, Mr. Miles Walker, as Chairman of the Manchester Local Section of the Institution of Electrical Engineers, gave an address on the progress of electrical design in relation to the reduction of capital cost. After showing the effect of the capital cost on the cost of electric power, he pointed out a few directions in which improvements might be made to increase the output of a machine of a given weight. He suggested that experiments to find a suitable iron and a suitable insulating material for electrical work should be carried out for the benefit of the electrical industry, by a laboratory equipped and maintained at the expense of the Institution of Electrical Engineers. (Page 585.)

A new motor starter and a new electric heater are described in short illustrated articles. (Page 586.)

The sub-station at the Manchester Exhibition had to be shut down for 8½ minutes on Saturday last owing to the failure of a cable between the H.T. switchboard and a motor-generator, which earthed one phase and blew the feeder fuses at the generating

Digitized by Google

station. As part of the arc lamps lighting the hall are separately supplied, the Exhibition was left sufficiently well lighted to prevent any confusion, although the hall was full of people at the time. (Page 587.)

A House of Commons Committee, presided over by Mr. Luke White, commenced consideration of the London and District Electricity Supply Bill on Monday, and is sitting every day. The details of the Bill have not been varied since it was passed by the House of Lords, with the exception that the House of Commons Committee have been instructed to insert the name of the London County Council in the Bill as the purchasing authority. We give some notes summarising the features of this and the two other Bills, which will also come before the Committee, and an account of Mr. Parshall's evidence and cross-examination. (Page 587.)

It is announced that the Buenos Ayres Municipality has decided not to proceed with its proposed scheme of tube railways in the city until next year.—The Folkestone Corporation have refused to allow the National Electric Construction Co. to substitute a combination of the conduit and overhead trolley systems for the surface contact system which the company originally contracted for.—A credit balance of £639 is shown in the accounts of the Govan Electricity Department for the year ended May 15th after meeting capital charges.—A cable is being laid by the Grimsby Electricity Department for giving a supply of electricity to the Admiralty wireless telegraph station at Humberstone.—The Hastings Tramways Company has refused to run its cars on Sundays, owing to the condition imposed by the Corporation that Sunday receipts shall not be taken into account should the Corporation desire to purchase the undertaking at any time.—The accounts of the Poplar Electricity Department for the year ended March 31st, 1908, show a gross profit of £16,920 against £14,576 for the previous year. After providing for capital charges, &c., there is a net balance of £2,264, but after meeting the deficit of the previous year, &c., the balance carried forward is £162.—Arrangements are being made between the West Ham Electricity Committee and the Charing Cross, City and West End Electricity Supply Co., for giving each other a supply of electricity on emergency. (Pages 589-590.)

An application is to be made to the Local Government Board for a loan of £30,000 by the Cardiff Electricity Committee. Stores are required by the Tramways Department of the Bradford Corporation; overhead tramway material by the London County Council; tramway track material by the Leith Burgh Council; and pipework, &c., by the Watford Corporation.—Specifications for considerable extensions at the Sydney and Dunedin power stations are in preparation, and inquiries are being made with regard to a water-softening plant by the Eastbourne Electricity Committee. The gas engine plant in the London County Council generating station on the Embankment has been sold for £450, a supply now being taken from the Charing Cross Company. (Pages 591-592.)

The first ordinary general meeting of the Victoria Falls Power Company was held in London on Friday, when the Chairman made a lengthy reference to the proposals for promoting a competing power scheme on the Rand. Mr. H. Wilson Fox, the vice-president of the company, also made a statement with regard to the company's policy concerning the utilisation of the Falls.—The accounts of the Edison & Swan United Electric Light Company for the year to June 30th show a balance of £19,193 available for distribution. (Pages 592-593.)

Among the specifications published by the Patent Office on Thursday last was one by E. A. Mitchell for a surface-contact system with magnetically-actuated switches within the studs. The specifications of the British Thomson-Houston Co. cover an arrangement of connections for lift-motors and an improved electrolytic lightning arrester. C. H. Stearn and C. F. Topham patent a spring support for metal filaments; and a radiator in which the bare-wire heating wires are immersed in oil is described by C. N. Nobbs, C. G. Nobbs, and J. E. Rosenthal. Regenerative working with single-phase commutator motors is the subject of a specification by W. Cooper. Short abstracts of these are given in our Patent Record. (Page 595.)

Under "Electrometallurgy and Electrochemistry" is given a note on a new method of obtaining nitrogen from the atmosphere by means of electrolytically prepared magnesium alloys. A process for coating metals with platinum is also described, and an improved form of the Girod arc furnace. (Page 597.)

The report of the International Conference on Electrical Units, which concluded its sittings under the presidency of Lord Rayleigh last week, has now been issued. The final result of their work has been agreement as to the adoption of certain definitions of a system of international units sufficiently near the true C.G.S. values to serve for the purpose of electrical measurements and as a basis of legislation. The international ohm is to be the resistance of a specified column of mercury, and the international ampere is to be the current which deposits a certain amount of silver under specified conditions. The international volt and watt are to be derived from these two primary units. The Conference have also approved of the use of the Weston normal cell as a convenient method of measurement for practical purposes. The Conference recommend the establishment of an international laboratory for keeping and maintaining international electrical standards. (Page 597.)

The Committee which was appointed to investigate the alleged damage caused to submarine cables by trawlers are of opinion that there is little risk of damage if the trawls are properly constructed and kept in repair. They are not prepared to recommend the proscription of any area, but suggest a system of Government inspection of the gear of trawlers. (Page 598.)

In the notes on 25-volt wiring, which Mr. A. H. Dykes contributes to this issue, an interesting suggestion is made. Mr. Dykes points out that when an auto-transformer is employed to reduce the pressure to 25 volts in the case of installations connected to A.C. town mains, the full pressure—say 200 volts—will still exist between one of the conductors and earth, but that if an ordinary transformer with a separately wound secondary be utilised, the potential will be limited to 25 volts, and this opens up possibilities for the consideration of systems of wiring differing from the standard methods now in vogue. One of these is the employment of a concentric system consisting of a conductor drawn into a well-bonded conduit (Mr. Dykes suggests the "Kalkos" tinned-brass conduit), with the conduit itself as a return circuit. A further development of this is a three-wire system; that is to say, a 50-volt secondary on the transformer with a neutral terminal connected to the centre of the winding. The house-wiring is divided into two separate circuits, one connected to each side of the secondary, with the conduit as the common return. As a matter of fact, this is more than a mere suggestion, for Mr. Dykes's firm has applied this system on work for which they are consulting engineers, and we hope to describe shortly an installation carried out

Digitized by Google

on these lines. It is true that all these arrangements for connecting 25-volt systems on to the town mains are likely to be only temporary expedients. Before very long we shall have, at any rate, 50-volt metal filament lamps of low candle-power on the market in quantities, and it is not unreasonable to expect that small lamps at 100 volts will shortly follow, although the 200-volt 8-c.p. metal filament lamp is doubtless some distance off. Nevertheless, Mr. Dykes's proposals have a distinct utilitarian side, and we regard his article as a most useful contribution to the practical study of how to derive the greatest possible benefit from the new lamp that has revolutionised the electric lighting industry.

From the statement made by Mr. Wilson Fox, the Vice-President of the Victoria Falls Power Co., at the first annual meeting on Friday, it is clear that the project of erecting an electrical power transmission line from the Falls to the Rand does not come within the immediate intentions of the company's engineers. Apart from the question of wayleaves, which apparently have not yet been granted by the Transvaal Government, it appears that the steam generation on the spot is likely to be so economical that there is a doubt whether it would be possible to generate electricity by water power and transmit it 600 or 700 miles at a smaller cost. Whilst keeping the larger object always in mind, therefore, the company is extending its steam plant, and with very satisfactory results, owing to the cheap supply of coal available. On the other hand, should events justify it, there is the probability that a station will be erected at the Falls solely for the purpose of supplying industries which the officials of the company are endeavouring to attract there. In all this the company is but carrying out the programme laid down in the prospectus, viz., building up a business before seriously taking in hand transmission from the Falls. The rumour that has been going around to the effect that a competitive power scheme was to be brought into existence on the Rand naturally received some severe criticism at the meeting on Friday, probably with the main idea of allaying any fears that might exist amongst the shareholders with regard to their investment under such conditions. To what extent the latter are likely to mature no one seems in a position to say very definitely at the moment.

Manchester Local Section, I.E.E.—At the inaugural meeting on Friday last, Mr. Miles Walker gave an address on the subject of the design of electrical machinery. We give the address in an abbreviated form elsewhere in this issue. The address was followed by a smoking concert. A very varied programme had been arranged, and one of the most appreciated items was a song by Mr. P. C. Pope descriptive of the Electrical Exhibition.

Storage Batteries in Generating Stations.—Interest will be added to the note (page 576) in our last issue wherein figures were given of the saving resulting in the installation of a D.P. battery in a generating station that had been running for some years, by the mention that the station in question is that of the Portsdown & Horndean Light Railway Co., at Purbrook, Cosham, Hants. The plant in the station consists of two 150 b.h.p. Deisel oil engines direct coupled to two 100 h.p. Brush dynamos, with 500 ampere-hour battery and Lancashire Dynamo Co.'s booster, supplying current at 500/550 volts for traction purposes. Owing to the variable load, the battery is always floating on the line. The battery consists of 250 cells of the D.P. Battery Co.'s L.S. 15 type in glass boxes with glass insulators. Capacity, 500 amperes for one hour, with a final voltage of not less than 1·8 volts per cell.

ARRANGEMENTS FOR THE WEEK

MONDAY, NOVEMBER 2ND.

P. & O. Batti-Wallahs.

7.45 p.m. Smoking concert at the Holborn Restaurant.

TUESDAY, NOVEMBER 3RD.

Institution of Electrical Engineers: Manchester Local Section.

7.30 p.m. Ordinary general meeting at the University. Paper to be read:—"Practical Considerations in the Selection of Turbo-Alternators," by Dr. M. Kloss.

Institution of Civil Engineers.

8 p.m. First ordinary meeting of the Session. Mr. J. C. Inglis will deliver his Presidential Address, which will be followed by the presentation of the medals and prizes awarded by the Council. There will be a reception by the President in the library after the meeting.

CORRESPONDENCE

SYSTEMS OF CHARGING.

To the Editor of Electrical Engineering.

Sir,—In your remarks on page 559 of your issue of the 22nd inst., you appear to suggest that any time spent by the Institution of Electrical Engineers in discussing such purely commercial problems as systems of charging could be far more profitably employed in "the wide field of engineering subjects."

When Parliament in its mercy is pleased to make an allocation from the Unemployed Fund for the Institution and its members, so as to render them above sordid financial considerations for evermore, we shall be entirely with you, and engineers can dream of and discuss for ever their hobbies without troubling one iota as to whether there be money in them or not. Meantime, however, this happy state of affairs does not obtain. For years now electrical engineers have spread their wares before the public, but the public have proved tardy buyers; in other words, highly technical and interesting as their wares have been, they have not justified themselves, in so far that *they have failed to make money*. They have not passed the only test the financial world can or should apply. In consequence, financial support is now withdrawn; electrical engineering concerns are practically at a standstill; the unemployed are numbered by thousands; and capital flows abroad, where it is more profitably employed.

Electrical supply undertakings to-day only offer the investor an average yield of 4·01 per cent., to say nothing of losses in the past, and purchase clauses, some of which will have to be considered in the near future. Without straw you cannot make bricks, and without money neither the electrical nor any other industry can live. Surely under these circumstances the policy of the Institution is right to set about getting the straw before building castles in the air with its bricks.

We are, Sir,
Yours truly,
Handcock & Dykes.

1 Victoria Street, Westminster,
October 26th, 1908.

[A great deal of time was spent by the Institution of Electrical Engineers last session discussing the systems of charging for electricity supply, and we cannot agree with Messrs. Handcock and Dykes that a resumption of the discussion on the same subject at the beginning of the coming session will materially assist in solving the "unemployed" problem.—Ed. E.E.]

To the Editor of Electrical Engineering.

Sir,—With reference to Mr. Wilkinson's letter on this subject which appeared in your issue of October

Digitized by Google

15th, undoubtedly lighting stations will feel the effects of the new type of lamp very much for the next few years. Alternating-current stations will suffer worse than the direct current ones for several reasons. The pressure can be easily reduced, allowing small candle-power lamps to be used, thus assuring the extensive use of these lamps in private houses. The all-day losses on the transformers and single long hour burning lamps will, as a rule, not be metered at all, as for A.C. registration meters of the electrolytic type are inadmissible, and these are the cheapest meters on the market.

The contract demand system of charging advocated by Messrs. Handcock & Dykes which necessitates a limit indicator, will, I am afraid, give a vast amount of trouble in practice, especially if meters are dispensed with, as Mr. Wilkinson proposes. Experience with this contract system has shown that some consumers take a very unfair advantage, whilst the honest ones grumble at not getting the same advantages whilst having to pay the same amount as their dishonest neighbours.

It would be interesting to know the system of charging most in vogue on the Continent, where electric light is, as a rule, much more extensively used, especially by the smaller consumer, than is the case in this country.

Yours, &c.,

Greenock, Oct. 27th, 1908. W. A. Toppin.

Wireless Telephony.—The *Financial Times* quotes the *Matin* to the effect that Vice-Admiral Aubert presented a report on Saturday last to the French Minister of Marine upon the recent experiments on wireless telephony between the Eiffel Tower and Villejuif, a distance of about six miles. It is stated that the experiments have been completely successful.

The Board of Trade and Provisional Orders.—The Board of Trade has issued a circular letter calling attention to the large number of cases in which, in recent years, Provisional Orders obtained by local authorities under the Electric Lighting Acts have had to be revoked by reason of the powers thereunder not having been put into operation. It does not appear to the Board to be desirable, or in the interests of a district, that an application should be made for an Order unless there is a serious intention on the part of the promoters to exercise the powers under the Order, if granted. In regard to future applications, therefore, the Board will, before granting an Order, require (in addition to the particulars as to financial position, &c., specified in No. XI. (5) of their rules under the Electric Lighting Acts) to be furnished with evidence that a scheme has been definitely considered by the promoters, and that the application is made with the view of putting that scheme into operation on the Order being obtained.

The Association of Teachers in Technical Institutions.—We have received from the Association of Teachers in Technical Institutions a copy of a memorandum which has been sent by the Association to the Board of Education, drawing their attention to the desirability of making certain alterations in the conditions of the Whitworth Scholarship and Exhibition Competitions. The most important alterations suggested are the inclusion of electrical engineering as a subject, and the rendering of the workshop qualification more rigorous. Other proposed changes include the introduction of a proposed preliminary qualifying test and alterations in the grouping of the subjects and relative value of the marking in each. It is also proposed to omit the examinations in building construction and naval architecture, and to introduce a special freehand drawing test. It is suggested with regard to electrical engineering that the examinations of the City and Guilds of London Institute should be accepted.

The annual meeting of the association will be held at St. Bride's Institution, Bride Lane, Fleet Street, on Saturday, November 7th, at 3 p.m., when the annual report will be considered, and other business transacted. The report mentions what has been done in approaching the Board of Education, the City and Guilds of London Institute, and the London University with regard to the reorganisation of certain schemes of work and examination and records resolutions regarding hours of working of teachers, and the provision of a common matriculation examination for all British Universities. Work has also been done in the direction of urging the registration of teachers and the inclusion of teachers in the provisions of the Superannuation Bill to be put forward by the National Association of Local Government Officers. A further meeting is to be held in the evening of the same day, at which Mr. W. J. Lineham will read a Paper on "Technical Education at the Franco-British Exhibition."

ANNUAL DINNER OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE annual dinner of the Institution of Electrical Engineers, held last Thursday at the Hotel Cecil, was an even more brilliant gathering than usual owing to the presence of the delegates from all parts of the world who are now in London in connection with the meetings of the International Conference on Electrical Units and Standards and the International Electrotechnical Commission. The attendance, too, was probably all the larger owing to the fact that on account of the illness of Lord Kelvin the function was abandoned last year. Mr. W. M. Mordey, M.Inst.C.E., President of the Institution, presided, and on either side of him sat the Right Hon. R. B. Haldane *H.M. Secretary of State for War*, and the Right Hon. Lord Alverstone, *Lord Chief Justice of England*. The large hall was crowded to the utmost, and about 400 members and visitors found places at the tables, which had been so carefully arranged by Mr. G. C. Lloyd, Secretary of the Institution, and his staff.

In addition to the long list of well-known electrical men present as Past Presidents, Vice-Presidents, Members of Council, and Chairmen and Secretaries of Local Sections of the Institution, the assembly included :—Dr. E. Warburg, *President of the Physicalische Technische Reichsanstalt*; M. P. Boucheret, *Président, Société Internationale des Electriciens*; Prof. J. J. Thomson, *Honorary Member*; Dr. S. W. Stratton, *Director, Bureau of Standards, Washington, U.S.A.*; Mr. R. A. Robinson, *Chairman, London County Council*; Mr. I. Réné Benoit, *Director, International Bureau of Weights and Measures*; Mr. George Franklin, *President, National Telephone Company*; Mr. Ormond Higman, *Chief Electrical Engineer, Inland Revenue, Ottawa*; Dr. Osuke Asano, *Department of Communications, Tokio*; Dr. Desire Harsanyi, *Director, Hungarian Royal Commission for Weights and Measures*; Mr. L. T. Weiss, *Engineer-in-Chief of Telegraphs, Brazil*; Dr. Jaeger and Dr. Lindeck, *Members of the Reichsanstalt*; Mr. Sherigu Kondo, *Department of Communication, Tokio*: Major W. A. J. O'Meara, *Chief Engineer to the Post Office*; Sir Robert Hunter, *Solicitor, General Post Office*; Sir H. Babington Smith, *Secretary, General Post Office*: Mr. Whittaker Thomson, *Chairman of the Highways Committee, London County Council*; Mr. A. P. Trotter, *Electrical Adviser to the Board of Trade*; and delegates from a large number of countries to the International Conference.

In view of the international nature of the gathering, the usual loyal toasts were extended to include the rulers of all countries represented by the guests. The toast, "Science and industries," was proposed by the Right Hon. R. B. Haldane, M.P., F.R.S., who spoke of science as being cosmopolitan and belonging to no one nation, and passed on to consider the influence of highly abstract science upon the highly concrete. He instanced what Mr. Franklin, whose name was coupled with the toast, and his associates, in telephone work had done for the application of electrical science to the needs of daily life. Prof. J. J. Thomson, who would also reply, was associated in their minds with the highly abstract aspects of science. The speaker looked back upon his student days at the University of Göttingen, where he well remembered the monument to Weber, bending over whom was Carl Friederich Gauss, the greatest mathematical worker the world had seen since the days of Newton, possessing in a remarkable degree that power also possessed by J. J. Thomson of applying highly abstract mathematical considerations to the problems of physics. In conclusion, he emphasised the good of these international gatherings. There was no real rivalry in the search after truth; all men were converging on a common problem when they worked on the application of science to industry.

Prof. J. J. Thomson, F.R.S., was the first to respond. He commenced by a feeling reference to the death of Lord Kelvin. Pure science owed a great debt to engineering proper. It was largely through the achievements of engineering that public appreciation had been directed towards science; in many ways, too, engineering developments had facilitated the carrying out of scientific research. In speaking of the advances which science, pursued for its own sake, had conferred on engineering, he took as an example the iron ring wound with a few turns of wire, which could be seen in the hands of Faraday at the Royal Institution, on the experiments with which practically the whole of modern electrical practise was based, and, looking into the future, suggested that the discovery of radium might have still more far-reaching results.

Mr. G. Franklin (President of the National Telephone Co.), who also replied, said that as science was essential to industry, so also industry was essential to science, and in establishing the connecting links between the two much had been done by the right hon. gentleman who proposed the toast. The surest basis of advance of industry was the scientific basis.

The toast of "The Institution of Electrical Engineers" was

Digitized by Google

then proposed by the Right Hon. the Lord Alverstone, G.C.M.G. (Lord Chief Justice of England). In an interesting speech he referred to the fiftieth anniversary of the establishment of Transatlantic telegraphy, and called to mind how as a boy he was taken to see the cable of 1857 being coiled into the tanks of the *Agamemnon*. He well remembered following its progress and rejoicing in the limited success of 1858. In passing on to the work of the conferences whose work was to standardise units and nomenclature, he hoped that, in addition to the honoured names already perpetuated, that the names of Kelvin, Thomson, and Siemens could be added, so as to be always in the minds of practical electrical engineers. In looking round he saw many leaders present, and his thoughts turned to some others who had passed away, including Sir Frederick Abel, Sir Charles Bright, John Hopkinson, Scudamore, and others. He congratulated the Institution in having acquired one of the most commodious buildings in London, and wished them God speed and great success.

The President, in his reply, welcomed the delegates from abroad on behalf of the 6,048 members of the Institution. The work that the Conference was carrying on might be said to have commenced at the meeting in 1861 of the British Association, when it was proposed to adopt four electrical standards—Electromotive force, quantity, current, and resistance. A committee was first formed to consider these questions in 1862, and the work had progressed continuously from that time. Mr. Mordey referred to the deaths of Lord Kelvin and Mascart, and mentioned the establishment of the Institution of the Kelvin lectures in the delivery of the first of which Prof. Silvanus Thompson had set such a high standard. With regard to the failure of the first Atlantic cable, this had succumbed to excess of volts, although the name volt was then unknown, and not from any want of skill on the part of Lord Kelvin or Sir Charles Bright, as an outcome of whose work communication was successfully established eight years afterwards. Submarine telegraphy had for some time remained practically where Kelvin had laid it then, but later great advances had been made by Mr. Sidney Brown, who applied to cable problems some of the knowledge gained in other branches of electrical engineering, and had rendered possible increase some 20 or 30 times the working speed available on the 22,500 miles of cable of the world. Another epoch was marked by the putting down by Holmes, in 1858, of the first magneto machine for arc lighting at the South Foreland lighthouse, and the first commercial application of electric lighting at the building of Westminster Bridge in the same year.

The toast of "The delegates to the International Conference on Electrical Units and Standards, and the International Electrotechnical Commission," was proposed in a characteristic speech by Professor Silvanus Thompson, F.R.S. Of these two bodies one, he said, had been concerned with standardising units, and the other with an attempt to create a new electrical engineering language. In looking back at previous work done in connection with units and standards he referred to the congresses at Paris, Frankfurt, Chicago, and St. Louis. As a result of the present conference, the ohm might now be said to have two values, the C. G. S. value, and the resistance of a certain column of mercury 106·3 cm. long, a figure to which the last conference had added two zeros. The two definitions together practically amounted to the establishment of the specific resistance of mercury by law, and he suggested that this might even entail a revision of our ideas as to the mass of a cubic centimetre of water. In conclusion, he welcomed the delegates, and paid tribute to the work of the two distinguished men whose names were coupled with the toast.

Dr. E. Warburg (President of the Physicalische Technische Reichsanstalt) pointed out that the main object of both bodies was a striving towards uniformity, and uniformity meant simplification. The establishment of community of interests was one of the best means of drawing countries together.

Monsieur P. Boucheret (President of the Société Internationale des Electriciens) then rose, and, speaking in French, expressed the congratulations of the Société Internationale des Electriciens, and in this he followed in the footsteps of the late M. Hospitalier, who had addressed a banquet of the Institution two years ago. He then spoke of the work of the Electrotechnical Commission, and paid great tribute to the energy of Colonel Crompton for what had been done since the St. Louis Congress. It was the Paris Congress of 1881 which originated much of the movement towards standardisation, which had been of such benefit to engineers, and with regard to the work of engineers he said, "L'Ingénieur a changé la face du monde."

Dr. E. W. Stratton (Director of the Bureau of Standards, Washington, U.S.A.) also responded. He referred to the addition of the two zeros to the figure for the length of the column of mercury as being to enable the Conference to report that no change had been made. The Conference would be remembered for more than dealing with the fifteenth or sixteenth place of decimals if its labours resulted in the establishment of a permanent authority, which would enable the laboratories of the great countries of the world to work in harmony.

The toast of the guests was proposed by Prof. Gisbert Kapp, and replied to by Mr. R. A. Robinson (Chairman of the London County Council).

SOME NOTES ON 25-VOLT WIRING

MANY people apparently believe that the 25- or 50-volt metal filament lamp is only a passing fad, and that before very long its use will have died out. Meantime, they hesitate to avail themselves of the undoubted advantages which its use offers at the present time. While it is true that metallic filaments are being improved, and that probably in time 200-volt lamps will be available of smaller candle-power than at present, such a lamp must always have a much longer and finer filament than one of the same candle-power for 25 volts.

It follows that the low-pressure lamp will not only be mechanically stronger, but will be capable of being run safely at a higher efficiency, and these advantages alone will well repay the cost of the slight loss of energy in the transformer. As it is practically certain that in the near future current will be charged for on the contract demand, or some similar system, the magnetisation current will in any case be charged at so low a rate as to make its cost inappreciable.

In converting an old or designing a new installation, a choice has to be made between three types of transformers, and it is important to consider the advantages and disadvantages of each. For purposes of comparison, assume that the maximum load on the secondary or low-tension side is to be 1,000 watts—*i.e.*, 25 volts, 40 amperes, the primary voltage being 200.

If the lights can be conveniently divided up into eight groups of 5 amperes each, all of which are in use approximately at the same time, the most efficient form, electrically, will be the balancer transformer (Fig. 1), consisting of a single winding divided into eight circuits.

The no-load losses in a balancer of this size will be approximately 18 to 20 watts, or 2 per cent., and the full-load losses the same, as if the circuits be equally loaded only the magnetising current passes through the winding. The maximum transformer losses will obviously be when half the circuits are fully loaded and half light, when the current passing through the unloaded windings will be 5 amperes, plus the magnetisation and transformer losses in the loaded section—

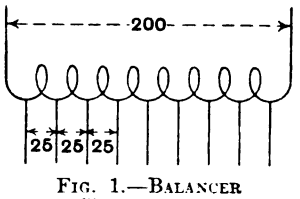

Fig. 1.—Balancer Transformer.

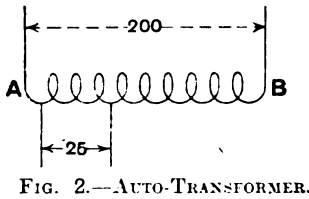

Fig. 2.—Auto-Transformer.

say, 28 to 30 watts, or 5·75 per cent. The pressure regulation is very good; between no-load and half-load the voltage on any circuit will generally not vary more than 1 per cent. (with constant primary volts), whilst at full load, of course, there is no drop at all. The list price would probably be about 65s. In using such a transformer, however, it must not be forgotten that although the voltage of each circuit is only 25, the voltage between different circuits may be as much as 200, and the terminals on the distribution fuse-boards must be arranged accordingly.

On account of the difficulty in splitting up the circuits easily, the more popular form of single-winding transformer is the auto-transformer (Fig. 2). This is somewhat more expensive to wind, the list price being

Digitized by Google

probably about 73s., and the losses are somewhat greater, being probably 20 to 22 watts on open circuit and 45 to 48 on full load. At half-load there is little difference between this and the former type. The maximum variation in the secondary volts between open circuit and full load is about 3¾ per cent. If the transformer is so connected that the point *A* is the

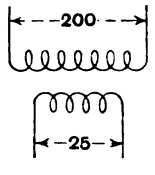

Fig. 3.—Double-Wound Transformer.

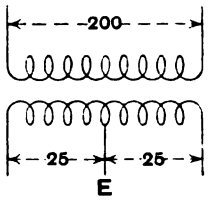

Fig. 4.—Transformer with Three-Wire Secondary.

middle point of the three-wire system, and if, further, the middle wire is at approximately earth potential, the pressure on any part of the house-wiring will not exceed that of the earth by much more than 25 volts. One cannot, however, rely on both these conditions always prevailing, and it will frequently happen that *B* is at earth potential, so that with this type of transformer as with the balancer, although the voltage of the house circuit is only 25, the potential of any wire above earth may be the full 200.

In cases where the insulation of the wires is not of the best, where it is desired to use a simpler, cheaper system of wiring, or where it is desired to secure the maximum safety from leakage, the use of a double-wound transformer is well worth consideration, although admittedly it is somewhat more expensive in first cost and also in transformer losses. A double-wound transformer (Fig. 3) would be listed at about 81s., and would consume about 24 watts on open circuit and 54 on full load, and would have a voltage drop from open circuit to full load of 4¼ per cent. This can be improved on if a little more money, say 108s., be paid, when the open circuit losses can be reduced to 14 and the full load to 44 watts.

The great advantage of a double-wound transformer, however, is the fact that it enables one to use concentric wiring. Concentric wiring with earthed outer presents very many advantages, and should be the cheapest form of wiring, but so far its use has been restricted to isolated plants or a few special cases where for any reason a house transformer has had to be used. By using a double-wound transformer where the secondary is entirely separate from the general system of distributing mains, the opportunity at once presents itself of earthing one pole of the secondary and using concentric wiring with an uninsulated return, thus saving half the insulated wire, half the fuses, and securing practically absolute immunity from shock or leakage currents. A very convenient system which the writer has adopted is to run the wiring in "Kalkos" tinned-brass tubing, using a single insulated wire and the brass tube as the return or uninsulated outer.

A further improvement, and one which the writer usually adopts, is to make the secondary winding two sections of 25 volts each, one each side of a three-wire system, with the middle point earthed (Fig. 4).

This reduces the cost of the transformer to, say, 73s., the same price as an auto-transformer of the same capacity. The open circuit losses would be 24 and the full load 51 watts. If the maximum efficiency type be used at a higher price, say 91s., the open circuit losses can be brought down to 14 and the full load to 41 watts. On this system each three-wire circuit consists of two insulated wires in one tube, the tube being the neutral or earthed conductor, and the lights being connected between either wire and the brass tube. The ordinary Kalkos fittings, plugs, holders, ceiling roses, &c., are used, one terminal of the plug or ceiling rose being earthed on to the outlet-box. In this way one secures all the advantages of 50-volt distribution, whilst no portion of the circuit is more than 25 volts above earth; there is no possible chance of stray currents, the risk of fire is reduced to an absolute minimum, and at the same time the amount of material required, and therefore the cost of the installation is reduced to a figure which cannot possibly be reached with ordinary double wiring in screwed tubing.

Such a system appears to the writer to fulfil every requirement for wiring buildings of a substantial character and private houses where appearance is studied and the wires have to be concealed, but there is a very large class of installations where the lowest possible first cost consistent with safety is called for. In such cases the use of a double-wound transformer of low voltage removes most of the objections to the use of flexible or so-called "Continental" wiring. It is at once obvious that the house-wiring, being entirely separated from the mains, is quite independent of the general leakage, and there must be a fault on both poles of the house-wiring itself before any leakage can occur. Under these circumstances, with a voltage of only 25 above earth, ordinary "flexible" is perfectly safe, and by its use the cost of wiring can be brought down to such a figure as to bring it within the reach of all.

A further improvement is to use a flexible concentric system with earthed outer, which can be quickly and easily cleated up to the walls, and where the bare outer covering forms a protection to the insulated inner wire. Such a system appears to the writer as likely to be the final solution of the cheap wiring problem. It is safe, easily fixed, inconspicuous, not easily damaged, and at the same time the cheapest of any to instal.

When the existing Wiring Rules were drawn up, 25-volt wiring was not contemplated, and it will doubtless be necessary to modify some of the regulations. It will no longer be necessary to assume that 60 watts will be consumed at each point as the new 16 c.p. (Hefner) lamps at 25 volts only require 18 to 25 watts depending on whether the filaments are of tungsten or tantalum. Sub-circuits up to 100 watts are at present limited to 5 amperes, which would mean only five to six lamps per circuit. The writer would suggest using 7/20 circuits with 10-ampere fuses carrying 10 to 12 lamps. Many of the existing ceiling roses, switches, plugs, &c., will obviously need to be redesigned in the direction of increasing the size of terminals to permit of looping (where thought desirable) the larger wire; but there are already on the market patterns which leave little to be desired, and as this class of wiring becomes more general, no doubt others will be brought up to date.

So far the use of 25-volts lamps on supply companies' mains has alone been considered, but there is another very large field for them in small private installations, where their use enables the number of accumulators to be cut down, thus leading to very considerable reduction in first cost. Whilst it is not likely that consumers on the mains of continuous stations will wire their points in series in order to use the small unit, comparatively sturdy, low-voltage lamp, such lamps are already being used to a larger extent than many people realise in cases where the lighting is principally by means of electroliers. It is a very simple and inexpensive matter to alter the wiring of an electrolier from parallel to series, and thus be able to use small bulb low-unit lamps which can be burned at any angle. By using shunt "Leuconium" lamps, the additional advantage is secured that the breakage of one lamp does not affect the remainder of the series.

THE PROGRESS OF ELECTRICAL DESIGN IN RELATION TO THE REDUCTION OF CAPITAL COST

On Friday last Mr. Miles Walker, as Chairman of the Manchester Local Section of the Institution of Electrical Engineers, gave an address on the above subject at the inaugural meeting of the section. He first spoke of the important position which Manchester held in the electrical world as a manufacturing centre, and also mentioned that the city had the largest municipal power station in England. The output of the station had been 63,000,000 units in the past year; the total cost of generation and distribution had been steadily decreasing, and new plant was being added. Continuing on this subject, Mr. Walker pointed out that not only in Manchester, but in all the neighbouring towns, electricity was being generated on a very economical basis. Salford had a total cost, including distribution and management, of only 0·62d. per unit; Bolton and Bury only about 0·56d., and at Stalybridge last year, the cost was only 0·45d. per unit. The load factor there was as high as 36·8 per cent.

Mr. Walker then pointed out how widely the field of supply would open out with a slight reduction of price, and how important an element in this was the reduction of capital cost. The average cost per unit (without providing for interest and depreciation), of all the electricity generated in the British Isles for lighting and power purposes—excluding stations for traction work only—was as high as 1·14d. per unit last year. But in large modern stations situated where coal is cheap, the cost was much lower. The total cost per unit had fallen in Manchester during the last five years, and it was still falling. Perhaps it was too much to hope that in a general supply as in Manchester, the figure would fall as low as 0·28d., the calculated figure for bulk supply to London, but for the sake of argument, ·035d. might be taken as a possible future cost if the load factor increased to 30 per cent.

Before we can arrive at the price at which electricity can be sold without loss, continued Mr. Walker, we must add to the total cost an allowance for interest and depreciation. The allowance per unit made in Manchester for interest and sinking fund is now as low as 0·55d. per unit, but it still makes a large addition to the price of electricity, and unless this falls as quickly in the future as the cost of generation and distribution, at the time when the latter has fallen to 0·35d., the capital charges will more than double the price of electricity to the consumer. The allowance for depreciation and interest may be taken as 3½ per cent., merely for the purpose of estimating the figure in pence per unit, which should be added to the cost of electricity before we can arrive at an average price per unit, which will give a reasonable return on the outlay. Now we can see how the older companies are handicapped in reducing the price of supply. The capital charge alone amounts to 1·45d. per unit, so that even if the works costs are reduced to 0·25d., the companies could not get a reasonable return on their capital without charging more than 1½d. per unit as an average price. Where competition is possible a new company with small capital could so much under-sell them that the rate of depreciation of their plant would become worse than ever. This serves sufficiently well to illustrate the great importance of low capital cost.

Now let us see how the progress of design has helped to make a little capital go a long way. A great number of factors are all helping in the same direction:—The steam turbine with its high speed, low cost, and small floor space. Improvements in the efficiency and power factor of electrical machinery. Improvements in materials which the designer employs. Improvements in insulation and in cables, which enable higher voltages to be used. Improvements in the lay-out of plant, and the marshalling of consumers so as to keep up the load factor of the station.

The capital cost of some power schemes in the past has been more than £120 per kilowatt installed. The average capital cost of the older supply companies in the British Isles is over £75 per kilowatt. There is very little doubt that in the near future complete supply systems will be equipped at a total capital cost varying between £20 and £35 per kilowatt, depending on the nature of the district. The generating station itself may cost as low as £12 per kilowatt, if of reasonable size. In this connection, Mr. Pearce has been good enough to furnish me with some interesting figures, based on the cost of the recent extensions at Manchester. These are as follows:—Generating machinery, including turbine, condenser, alternator, and foundations, can be put in at a cost of £3·75 per kw.; boilers and steam supply, including economisers, superheaters, coal and ash conveyors, foundations and steam pipes, at a cost of £2·25 per kw.; switchgear for generators and feeders, rated at the generator capacity comes to about £0·5 per kw.; and if we allow £5·5 per kw. for land, buildings and accessories, this gives a total of £12·00 per kw.

Mr. Walker then showed some photographs of machines built in 1902 and 1903, and machines of the same output, built in 1907, to show the reduction in size and weight which had been attained by improvements in design. He also gave several comparative figures for the efficiency of machines built in the same periods, and commented on the increased use of motor converters in preference to motor generators.

Continuing, Mr. Walker said:—It is interesting to ask how far further improvements will be made in the future. Ordinarily the output of a given frame is limited by its temperature rise under load. This can be reduced either by improving the efficiency so that less heat is produced, or by making provision for carrying the heat away. The first is to be preferred wherever it is possible. The improvements made in the last four years in the quality of the iron and in the methods of working the iron, have very greatly reduced the iron losses, particularly in the case of transformers. It would be worth while to make very elaborate, and even costly experiments to determine whether any substantial improvement can yet be made in the quality of sheet iron used for electrical purposes. Investigations of this kind, the results of which would benefit the industry as a whole, ought to be carried out by some official technical institution. One of the things which we may look forward to in the growth and strengthening of the financial position of our institutions is the undertaking of important experimental work of this character. If a manufacturer undertakes the work he is often hampered by want of facilities, want of funds, and want of time, and even if he is successful his competitors often reap as great a benefit from his researches as he does.

The lines along which improvements have been made in the past with respect to the dissipation of the heat produced, are:—(1) Larger surface has been presented to the air; (2) the air is caused to pass quickly through the machine; (3) pockets in which the air remains unchanged are avoided; (4) care is taken that cold air enters and the hot air is expelled in such a way that it does not return; (5) in places where air ventilation cannot be carried out, good provision is made for heat conduction. An inquiry into the heat-conducting qualities of insulating materials is another matter which might be referred to an official experimental institution. Some good work in this direction has already been carried out by the National Physical Laboratory. If an experimental institution would provide a thoroughly satisfactory insulator, that would do more than anything else to cheapen the cost of electric supply, and add to the general reliability of electrical plant.

Automatic Gates for Level Crossings.—An apparatus for automatically closing the gates of a level crossing on the approach of a train is described in an American Consular Report. The apparatus has been installed at several crossings on the Montreux-Bernese Oberland Electric Railway in Switzerland, and has given great satisfaction. At a distance of 500 feet from the crossing, the approaching car, by making contact with a special wire, closes a circuit which sets a mechanism in motion. This mechanism shuts the gates, keeps a warning bell ringing, and at night lights up a red lamp on the gate. After the car has passed the gates, and travelled another 500 feet, the circuit is broken, a counterbalance weight opens the gates, the bell stops ringing, and the lamp is switched off.

Rugby Engineering Society.—The Presidential Address of Mr. A. F. Bennett at the inaugural meeting of the session on Thursday, October 15th, dealt with the progress of steam engineering, and traced the different stages through which the theory and practice of steam engine construction had passed in arriving at the present state of development. He commenced with the work of the earliest experimenters of whom any record exists, and paid particular attention to the earlier progress of steam locomotion. With regard to the present and the future, he said that the steam turbine had now unquestionably prevailed as the most efficient form of steam prime mover, and there was little doubt that the further extension of its use would be rapid and complete. With equal certainty it might be said that the internal combustion engine had come to stay. In the best modern steam engines, barely 20 per cent. of the heat supplied is turned into useful work, whilst gas engines had given thermal efficiencies of over 30 per cent., and in the case of the Diesel engine over 40 per cent. had been obtained. Independently of the question of the gradual using-up of the available fuel supply, the problem of more efficient heat utilisation could not fail to be the problem of the future. The possibilities of that type of machine in which the fuel is burnt on the piston and a high range of working temperatures secured, would, in spite of practical difficulties, assert themselves strongly in the future.

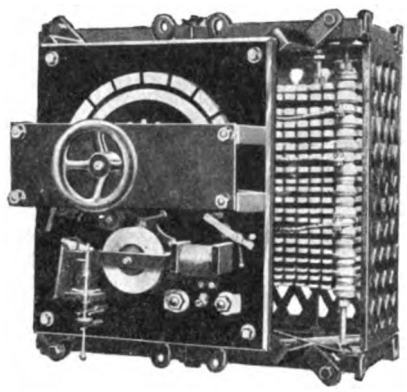
A NEW MOTOR STARTER

THE accompanying illustration represents a new type of starter with an automatic step-by-step motion, which Messrs. Siemens Brothers' Dynamo Works, Ltd., have recently brought out to eliminate certain troubles to which some forms of ordinary starters sometimes give rise.

When starting up the motor the operator simply moves a hand-wheel to a certain position, and then releases his hold of it, whereupon the mechanism of the starter comes into action and completes automatically all operations without further interference on the part of the attendant. A special feature of the starter is the step-by-step motion of the switch arm, the great advantage of which is that sparking is reduced to a minimum, since the switch arm moves sharply from one contact to the next, and then remains for a few seconds on this contact while



THE SIEMENS "FLYWHEEL" STARTER.

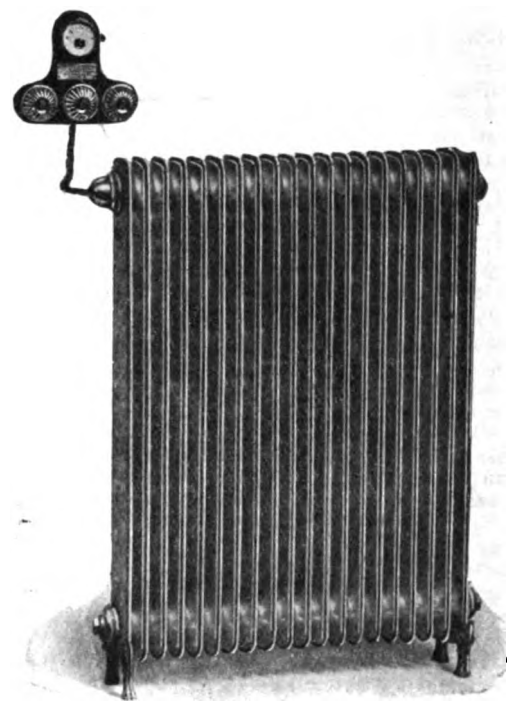
the motor has time to accelerate. The time of starting is arranged to suit the particular size of motor; for instance, for a 30 b.h.p. motor the standard time of starting is 30 seconds.

Since the exact time spent on the contact is known, the resistance can be so designed as to give uniform acceleration. Should an overload or failure of the supply occur either whilst starting or running, the starter arm returns automatically to the "off" position. The switch arm cannot be moved from the "off" position unless the main switch has been closed; this eliminates the danger of the main switch being closed with the switch arm in any but the "off" position.

In order to start the motor the attendant moves the hand-wheel in an anti-clockwise direction, thus putting a powerful spring into tension. This spring operates an escapement gear which causes the starter arm to move step by step over the contacts. The starter is equipped with overload and no-voltage releases, and the motor may be stopped by short-circuiting the no-voltage coil by means of a push button in the usual way. Examples of the starter are on view at the Manchester Exhibition.

A NEW ELECTRIC HEATER

A NOVEL type of electric heater, for which great advantages are claimed over the more familiar lamp radiators and "convectors," has been recently placed on the market by Messrs. Purcell & Nobbs, of 87–89 Cleveland Street, Fitzroy Square. One form is shown in the accompanying figure. The actual resistance heated by the current is in the form of wires immersed in oil of good heat-conducting capacity contained in a sealed casing, offering a very large surface to the air. The object of thus exposing a large surface at a comparatively low temperature is to enable as large a proportion of the heat as possible to be used for direct air warming, and as little as possible to pass through the air as "radiant heat" without warming it. It is well known that the higher the temperature the greater is the proportion of heat given off as radiation. For instance, it is stated that a surface at a temperature of about 1,200° Farenheit above 60° degrees Farenheit of the surrounding air give out about 95 per cent. as radiant heat, and only about 5 per cent. will be used for direct air heating by convection. At a temperature difference of about 750°, which is the temperature employed in most so-called convectors at present on the market, the amount of radiant heat given out will still be 80 per cent. If, however, a heater is constructed to have an outside temperature of only 200° Farenheit, *i.e.*, a temperature difference of about 140° Farenheit at 60° Farenheit of the surrounding air, the amount of heat given off by radiation will only be about 30 per cent., and thus 70 per cent. of the available heat will be used for direct air warming. It is on these considerations that the company base their claim that with their apparatus the current required to heat the air in a room of given size is reduced to one quarter, so that the cost of efficient electric heating (with current at 1d. per unit) is brought into favourable comparison with other forms of heating, besides possessing all its advantages of cleanliness and controllability. We understand that, notwithstanding their considerable heat



"ELECTROYL" HEATER.

capacity, these radiators come up to their full temperature in from seven to fifteen minutes.

A special form is made for tramway and railway work, and its use obviates the difficulties found with some types of heaters in which the wires are apt to crystallise under the influence of vibration.

CATALOGUES AND PAMPHLETS RECEIVED

INSULATORS & BITUMEN SHEETING.—Two further new lists have been issued by Messrs. Johnson & Phillips during the week. One deals with a number of styles and types of porcelain insulators, together with the necessary bolts and fittings required for erecting this type of material. The other contains particulars of Paterson's bitumen damp proof sheeting which is serviceable for use in buildings where it is desirable to prevent damp from rising.

MOTOR CONTROL APPARATUS.—A handsome new catalogue of motor starters, controllers, &c., has been issued by Premier Electric Control, Ltd., a number of forms of single-lever motor starters are listed, including the pattern shown at the Manchester Exhibition on Messrs. Parmiter, Hope & Sugden's stand, and illustrated on page 33 of the supplement to our last issue. The "one-minute" pattern of rheostat is guaranteed to start a motor once in every five minutes, and the resistance is designed to carry twice the full load current of the motor for a period of one minute without undue heating. The multiple-lever starters for large motors were also described last week in connection with the exhibition. These are listed up to 200 h.p. A number of regulating starters for both series and shunt regulation are included, and further items in the catalogue comprise slow-motion attachments for ordinary starters, three-phase starters, shunt rheostats, complete motor panels, drum and lever type reversing controllers, iron-clad switches, fuses, &c., and "Schorch-Premier" high-tension oil switches. The convenience of the list is enhanced by the provision of a flap at the back by which it can easily be recognised and drawn out from among other lists, or hung up if desired. Bound in the list is a perforated post-card, with a numbered counterfoil which, when a catalogue is sent by an agent to a client, can be torn out and returned to the company as a record to be filed.

REMOTE CONTROL SWITCHES.—Messrs. A. Emanuel & Sons send us a catalogue of Blackmore's patent remote control switches, which are constructed so that they can be operated by push-buttons from any number of points. The switch itself is actuated by an electromagnet with a pivoted armature through an ingenious system of levers. The current for this can be supplied by a local battery, and the control effected through a relay, or the actuating current can be taken from the supply mains.

THE EMERGENCY LIGHTING AT THE MANCHESTER ELECTRICAL EXHIBITION

ALTHOUGH for the greater part the sub-station at the Electrical Exhibition in Manchester has been erected on what may be termed permanent lines, it was deemed advisable to make the fullest possible provision for emergency. The hall is lighted by 54 arc lamps. Forty-four of these are magazine flame lamps, and these are divided into eleven circuits. Eight of these circuits are on the ordinary D.C. 'bus-bars, and the remaining three circuits (*i.e.*, 12 lamps) are run off "emergency" 'bus-bars on the L.T. side, which are normally connected on to a small gas-engine set on Messrs. Crossley Bros.' stand. In addition to these 12 lamps, 10 enclosed lamps are connected, two in series on a ring main, also supplied from the emergency 'bus-bars. Thus, in the event of the sub-station supply failing, 22 lamps on four circuits remain alight, and this is quite sufficient to afford a fair general illumination. In addition, along one side of the building on the exterior there are seven weather-proof fittings, each with two 25-c.p. tantalum lamps, and at two of the side exits near the main entrance there are enclosed arcs, and these are also connected to the emergency 'bus-bars.

On the emergency panel of the sub-station switchboard there is a throw-over switch by which the emergency 'bus-bars can be connected to the main sub-station 'bus-bars instead of to the Crossley set, and at the back of the board is another throw-over switch which enables the emergency 'bus-bars to be connected to the ordinary distributing network which supplies the suburb of Rusholme, and is fed from the Rusholme sub-station.

The efficiency of the arrangements was fully demonstrated on Saturday last, when the sub-station in the Exhibition was shut down at 6.45 for 8½ minutes. The lights on the stands, which have not independent supply from their own generators or cells, were, of course, extinguished, and part of the arcs in the hall and the lamps on the main entrance roadway were out, but the hall remained quite light, and there was nothing in the nature of confusion among the public; the only result was a slight crowd round the sub-station to see what had happened, and a little excitement in the tea-room, which was left in complete darkness.

The cause of the interruption was as follows:—One of the three vulcanised rubber cables connecting the induction motor-generator to its panel on the high-tension switchboard broke down beneath the switchboard and earthed one phase. This not only threw out the switch on the panel, but also blew the fuses at the Stuart Street generating station end of the feeder which was supplying the Exhibition sub-station. The supply was therefore cut off both from the A.C. and the D.C. circuits in the Exhibition with the exception of the emergency lights, which we have referred to. Stuart Street and the Exhibition sub-station, of course, got into communication at once, and the fuses were restored and the A.C. circuits switched in again. This took five minutes, however, at the end of which time the exhibitors who take A.C. current had their supply resumed. The rotary converter was next started up, and then the motor-converter—these two machines being ample for the supply—and the D.C. circuits were switched on again. For this another 3½ minutes was requisite, and at the end of 8½ minutes everything was in its normal condition. The faulty cable was replaced on Saturday night, and on Monday all three machines were running as usual.

LONDON ELECTRIC POWER BILLS

Proceedings before House of Commons Committee

A Committee of the House of Commons, presided over by Mr. Luke White, commenced consideration of the London and District Electricity Supply Bill on Monday. The other members of the Committee are Mr. James Parker, Mr. Baldwin, and Mr. Esslemont. Owing to an objection by Mr. A. C. Morton to the second reading of the London Electric Supply Bill and the London (Westminster and Kensington) Electric Supply Bill on the 19th inst., these measures have been put down for second reading in the House of Commons on Monday next. There are no less than ten motions on the paper in respect of these two Bills. Mr. Churchill will move an instruction to the Committee which will consider them that the London County Council be named as the purchasing authority; Mr. A. C. Morton has given notice of his intention to move that both Bills be rejected; a motion in the name of Mr. Claude Hay asks for the insertion in the Bills of similar linking-up powers for local authorities owning electricity works; two other motions have for their object the prevention of the companies from obtaining additional compensation in the event of purchase by reason of severance or by reason of the existence of agreements for mutual assistance; and Mr. Lough will seek to bind the companies from opposing future electrical legislation on the part of the borough councils.

With regard to the Bill now before Committee, Mr. Lough has given notice of the following motion on Monday, but it does not affect the progress of the Bill in Committee:—

That it be an instruction to the committee to modify the terms of purchase proposed in the Bill so that, within six months of twenty-eight years from the passing of the Act, and within six months after the expiration of every subsequent period of seven years, the London County Council may require the company to sell, and thereupon the company shall sell to them their undertaking upon terms of paying the then value (exclusive of any allowance for past or future profits of the undertaking or any compensation for any compulsory sale or other consideration whatsoever) of the undertaking and all lands, buildings, works, materials, and plant of the company suitable to and used by them for the purpose of their undertaking, such value to be, in case of difference, determined by an engineer or other fit person nominated as referee by the Board of Trade on the application of either party.

The following notes give quite briefly the nature of previous Bills of this character which have been promoted, together with those now before Parliament:—

In 1904, the East London and Lower Thames Electric Power Bill was before a committee of the House of Commons, but it was rejected on financial grounds. In the following year Mr. C. H. Merz came forward with a much more comprehensive scheme in the Administrative County of London and District Electric Power Bill, but after passing committees of both Houses of Parliament there was not time for it to pass the remaining stages, and the Bill lapsed. In 1906 followed the London County Council Bill, and also the Administrative County of London Bill, but only the former was read a second time and came before a committee of the House of Commons It was, however, rejected, the committee making a special report, in which they referred to the importance of the subject, and urged that it should not be allowed to drop. In 1907 another Bill was presented by the London County Council, in which it was recommended that the undertaking should be leased to a company. This, however, was not approved by Parliament, and consequently the way was clear once more for private enterprise. Accordingly, three Bills were introduced this session, and were considered by a committee of the House of Lords, presided over by Lord Cromer, the hearing lasting no less than thirty days, with the result that the House of Com-

Digitized by Google

mons had to defer dealing with the Bills until the autumn session. Considerable alteration and amendment took place during the Lords' committee stage, and the present position in relation to these Bills is summarised below.

The London and District Electric Power Bill, the engineers to which are Mr. H. F. Parshall and Mr. Robert Hammond, proposes to incorporate a company with a capital of £4,500,000 to give a supply of electrical energy in bulk and for power purposes in an area, including the whole of the County of London and certain selected portions of the counties of Kent, Surrey, Middlesex, and Essex, having a total area of 451 square miles, of which 117 are within the County of London and 334 without. A power station will be erected at Barking, having a total capacity of 144,000 kw. of plant installed. Generation will be upon the three-phase alternating-current system at 15,000 volts and 50 cycles, there being 14 control stations connected with the main generating station by duplicate mains. These control stations will feed transformer stations, from which the actual supply to the consumer will be given. Supply may be given in bulk to authorised undertakers and to persons requiring a supply for power purposes, but a power user supplied by the company in the area of an existing supply authority may not use more than 15 per cent. of his total supply for lighting purposes. In all previous Power Bills this is 20 per cent., but Lord Cromer's committee deemed it wise to reduce the proportion in view of the greater efficiency of metal filament lamps. The company, of course, cannot supply any individual power user in the area of an existing supply authority without the authority's consent, but there is an appeal to the Board of Trade should that consent be unreasonably withheld. The power company is not restrained, however, from supplying railways, tramways, canals, docks, &c. The maximum charges in the Bill are as follows:—Untransformed alternating current, £3 per annum per kw. of maximum demand, plus 0·25d. per unit: transformed alternating current, £3 10s. per annum per kw. of maximum demand, plus 0·3d. per unit; direct current or transformed alternating current converted to any other periodicity than that of the main supply, viz., 50 cycles, £4 10s. per annum per kw. of maximum demand, plus 0·33d. per unit.

An important feature of the Bill, and one about which there will be considerable discussion in committee is the purchase clause. As matters now stand, however, the London County Council is authorised to purchase the undertaking in 1931, or subsequent periods of ten years to 1961, by giving twelve-months' notice. In 1961 the terms of purchase will be the "then value" as a going concern, but if the purchase takes place in 1931, 1941, or 1951, there is to be paid an extra sum as compensation for the loss sustained by the company by reason of such earlier sale. This sum may be agreed or determined by arbitration. To these terms, however, there is very strong objection. The Bill now contains protective clauses for practically all interests except those which object to the principle of the measure.

Although the London Electric Supply Bill, when introduced this session, asked for supply powers over a somewhat similar area to that scheduled in the previous Bill, in addition to authority for linking up the power stations of a certain number of the companies, the Bill was reduced to a very simple measure by Lord Cromer's committee. It now enables the companies named in the Bill to link up for the purposes of mutual supply, and also to give a supply of electrical energy to railways, tramways, canals, docks, &c. The companies concerned in the promotion are Charing Cross, West-End and City Electricity Supply Co., Metropolitan Electric Supply Co., London Electric Supply Corporation, Chelsea Electricity Supply Co., Brompton and Kensington Electricity Supply Co., South Metropolitan Electric Light and Power Co., London Electric Lighting Co., and the County of London Electric Supply Co.

The third Bill is on exactly the same lines, and gives similar powers to the St. James's and Pall Mall Electric Light Co., the Kensington and Knightsbride Electric Lighting Co., Westminster Electric Supply Corporation, and the Notting Hill Electric Lighting Co.

When the Committee met at noon on Monday, the attendance was somewhat smaller than has been usual in connection with these Bills. There are, as before, a very large number of petitions against the Bill, including the London Electric Lighting Companies and practically all the important borough councils, but the London County Council are not represented by counsel. The promoters have retained the same counsel as before, viz., the Hon. J. D. Fitzgerald, K.C., Mr. Talbot, K.C., Mr. Clode, and Mr. Thomas, and in his opening speech Mr. Fitzgerald gave a most detailed account of the history of these power proposals, more detailed than would appear necessary to a Committee which contained two members who have already served on earlier Committees. Two points he emphasised, viz., that the urgency of the question was undoubted in view of the reports of previous Committees, and, secondly, that all existing supply authorities had been granted their powers upon the distinct understanding, as laid down in the Electric Lighting Act of 1888, that they were not given a monopoly. Mr. Fitzgerald also made full use of the report of Mr. Luke White's Committee of 1906, which stated that the Administrative Bill was conceived on scientific lines, failing the passing of a Bill promoted by the London County Council. As the present Bill is admittedly on precisely similar lines to that of the Administrative Bill, the inference is obvious. The Chairman was also reminded of another statement in the report of his Committee of 1906, viz., that failing the promotion of a Bill by the London County Council the way should be made clear for private enterprise. Mr. Fitzgerald thus cleared the way on several important matters of principle in connection with the Bill. Another matter which Mr. Fitzgerald took an early opportunity of mentioning was the recent breakdown at Lots Road, and the letters which were sent to the Press by opponents of his Bill, pointing out the grave consequences if this supply had been to the whole of London instead of only to the railways. The answer to that, he said, was very simple. The Barking power station, which the opponents apparently did not know, would be built in sections, so that a breakdown on one section would not affect the supply from the remaining sections, and that such an event would not affect the supply to London, nor cause the least inconvenience to anyone. On the other hand, had the Barking power station been in existence at the time of the Lots Road accident, and the precaution taken to have a connection ready to be made, a supply could have been given to Lots Road from Barking in five minutes.

The general features of the London and District Electricity Bill are summarised above, but in placing them before the Committee, Mr. Fitzgerald drew attention to the small proportion which the power supply of the existing authorities represents of the whole of their output; to the possibility of railway electrification with a cheap supply of power available—thus obviating capital expenditure on power stations on the part of the railway companies—and the fact that low as the schedule of prices in the Bill is, the promoters believed and hoped they would be able to supply at still cheaper rates. On the question of competition, attention was drawn to an addition to the Kitson clause which was made at the instance of the London County Council in the House of Lords, viz., that in any arbitration proceedings at the hands of the Board of Trade, the arbitrator shall have regard to the capital expenditure, &c., upon the undertaking in whose area the promoters propose to give a supply. Complaint has been made that the price at which the power company would supply under these circumstances is not quoted in the Bill, but it was explained that owing to the wide differences in the possible demands of various consumers, it was impossible to do this. The Board of Trade arbitrator has the power to determine whether the proposed price of the power company is a sufficient and proper one, and if it were shown that the price was an unduly low one, then it could be taken that the consent of the Board of Trade to the proposed supply would not be granted.

On Clause 67, the purchase clause, Mr. Fitzgerald reminded the Committee that Lord Cross's Committee had reported against it, as a general rule, in power Bills. He did this in order to show the very different position of the promoters of this Bill as compared with the promoters of any other Bill of the same character. Dealing with the terms of the clause, Mr. Fitzgerald at once said that a concession until 1931 only, without compensation for the remaining years, as proposed, until 1961, was not one which would tempt any investor. As to the authority which shall carry out the purchase, Mr. Fitzgerald cut his remarks short in view of the instruction to the Committee by the House that the London County Council shall be named in the Bill. Similarly, with regard to Clause 77 (power to acquire undertakings), the Board of Trade will lay its views before the Committee, and here again Mr. Fitzgerald had little to say. The Board of Trade object to the clause, and Mr. Churchill has intimated that unless it is modified or withdrawn he will oppose the Bill on third reading. The promoters, however, are more or less indifferent in the matter, although they regard the clause as a useful one.

Mr. Fitzgerald's concluding remarks dealt with the petitions. Whereas in the other House there were 69 petitions against the Bill, there are now 38, of which only 19 are supported by the appearance of counsel. He first of all ridiculed a suggestion by the City of London Corporation that the whole matter should be relegated to a Royal Commission, and then drew attention to the petition of the London companies, which, he said, absolutely contradicted their attitude in the House of Lords. Then, they promoted a Bill to meet the power demand in London. That proposal was rejected, and now they said there was no demand to be met, beyond what they were already dealing with. The companies also still displayed their usual inconsistency; on the one hand, they alleged that the power company could not supply, except at a loss, at the schedule of prices in the Bill, and on the other, asserted that they themselves could supply, presumably at a profit, at lower rates. The real opposition, both on the part of the companies and local authorities, was competition.

In a discussion as to procedure, the Chairman intimated that whatever arguments were brought forward against the L.C.C. being inserted as the purchasing authority, the Committee was bound to carry out the instruction of the Committee.

Mr. H. F. Parshall, joint engineer to the scheme with Mr. Robert Hammond, gave his evidence on Monday and Tuesday, but as the facts upon which he bases the scheme, together with the engineering and other details of it, have not changed since the Bill was before the House of Lords, there is nothing new to be

Digitized by Google

added. An outline of the details appears above, and a complete account, together with a map of the area and drawings of the proposed power-house, appeared in ELECTRICAL ENGINEERING, Vol. III., p. 721. The cross-examination has, so far, revealed no very new points, except that the authorities outside the County of London who oppose are regarding the instruction to the Committee, that the London County Council shall be the purchasing authority, as a new and additional argument for leaving them out of the area, in order to avoid municipal complications by reason of one county council having powers over an undertaking in the area of another county council. For the rest, the opponents show all their old inconsistency. Even Mr. Erskine Pollock, K.C., who appears on behalf of the Middlesex County Council, and really wants to be cut out from the Bill, complained that the promoters had not taken in enough of Middlesex. They had, he said, only scheduled that portion which was just over the London County border, and which was industrial; but when Mr. Parshall offered to take in more counsel hastily informed the Committee that the Middlesex County Council wished to be excluded. Similarly, Sir Ralph Littler, for the City of London Corporation, whilst complaining of the proposal of the company to lay mains in the City, in the next question asked if Mr. Parshall was aware that the City had special powers to regulate the laying of mains. Mr. Parshall's query as to why, then, the City Corporation was concerned on this head, remained without a satisfactory answer. Mr. Seymour Bushe, K.C., for the Westminster, Kensington, and Knightsbridge, Notting Hill, and St. James and Pall Mall companies, expressed his concern for his companies, on the one hand, and for their consumers on the other. He sought to show that the power company would endeavour to secure their customers by undue competition, yet he put it to the witness that the companies which he represents are selling power at cheaper rates than would be possible to small power users—which were all the West End companies had—under the schedule in the Bill. Obviously, if the latter is the case, the companies are protected, whilst the consumer can come to no harm in that he cannot be forced by the power company to pay a higher price for his energy than he now pays to the existing companies. And this, in effect, was Mr. Parshall's answer. Mr. Bushe pointed to a map on the wall showing the companies' area, and asked at what points it was proposed to give a bulk supply to them. He was answered by Mr. Hammond, who mounted a table, and with an umbrella, in the absence of a pointer, prodded the map indiscriminately and shouted "Wherever you want it." In reply to Mr. Balfour Browne, K.C., for the North Metropolitan Electric Power Co., Mr. Parshall refused to cut this company's area out of his scheme, because Mr. Merz had done this in 1905. Mr. Merz, he said, gave away a good deal in his dying hours.

LOCAL NOTES

ABERDEEN: *Overhead Wires.*—In connection with the lighting of the Culter district, the County Council has granted its permission for the Corporation to erect overhead wires.

ACTON: *Electric Wiring.*—The Electricity Committee recommend that in future wiring be carried out by the electricity department, where the cost is estimated not to exceed £50. Where the work was estimated to exceed that figure, the Electrical Engineer was to obtain tenders. An amendment to refer back was carried when the recommendation came before the Council.

Auditor's Surcharge Remitted.—In connection with the recent Electrical Exhibition held at Acton, a sum of £10 was granted the Electrical Engineer in respect of extra services, but this amount was surcharged by the Auditor. A communication has now been received from the Local Government Board confirming the decision of the Auditor, but exercising on this occasion its right to remit the amount.

BATH: *"Black Smoke" Nuisance.*—Mr. F. Teague, the engineer and manager of the electricity works, has written to the Sanitary Committee complaining of the remarks recently made by their officers with regard to the emission of smoke from the power house chimney. Mr. Teague complained that the trouble had been greatly exaggerated, and would be likely to do harm to the undertaking. He also mentioned that within a few days of the report of the inspector being published several offers had been received to supply them with stokers to avoid the smoke. The Sanitary Committee have, however, passed a resolution instructing the surveyor and inspector to continue to keep observations upon the electricity works chimney.

BLACKROCK: *Threatened Legal Action.*—The Council has held a meeting to consider what action shall be taken with regard to the condition of the tramway track of the Dublin United Tramways, Ltd., in Rock Road. The Council have instructed their law agent to communicate with the Tramways Company at once, and to submit the question of an action against the Tramways Co. to counsel for advice in the advent of the reply not being satisfactory.

BRAZIL: *New Submarine Cable.*—A decree has been issued authorising Messrs. Felten & Guillcaume Lahmeyerwerke, A.G., of Mulheim, to lay and work a submarine telegraph cable between the Brazilian coast and the island of Teneriffe.

BRISTOL: *Tramway Extension.*—An extension of the Bristol tramway system to Westbury has been opened, after inspection on behalf of the Board of Trade, by Colonel von Donop.

BUENOS AYRES: *Tube Railways.*—It was thought, says the *Review of the River Plate*, that before the end of the present session of Congress the question of tubes in the City of Buenos Ayres would have been settled, and that at least the concessions applied for by the Western and Amalgamated Railways would have been sanctioned. Such, however, was not to be the case, as it has been resolved by a large majority to shelve the question until next year. This is a bad look out for the city. The Corporation is not in a position to carry out the work, whilst the railway companies are, and the conditions that they offered to the Government were eminently satisfactory to the community. The Corporation will now have until next May to see what it can do in the matter, but there is no reason to hope that it will be able to do anything. Its first attempt to carry out the work by public tender was a dismal failure, only one tender having been presented, and this was not in accord with the specifications, nor was it suitable to the interests of the City.

BURSLEM: *Electricity Charges.*—At the recent Local Government Board inquiry, in connection with an application to borrow £12,000 for the purposes of the electrical undertaking, Mr. H. R. Hooper made some remarks with regard to the inadequacy of the electric light tariff. The Electricity Committee have passed a resolution saying that they see no reason why any alteration should be made in the scale of charges for electricity for lighting or power. The Chairman of the committee states that they have satisfied themselves that the electricity undertaking is in a sound position.

CLEETHORPES: *Electric Lighting.*—The Council's Electric Lighting Provisional Order will expire this month, but in order to keep the Order alive it has been decided to proceed with a scheme for laying cables along a number of roads, power being taken from the tramway generating station.

DUDLEY: *Tramway Agreement.*—A satisfactory settlement has been arrived at in connection with the terms of purchase by the Corporation of the tramways in the district, and their release to the Dudley, Stourbridge & District Tramway Co.

FOLKESTONE: *The Tramway Question.*—The new proposals of the National Electric Construction Co. in regard to the carrying out of its tramway powers, namely, that instead of the Dolter surface contact system, the conduit system be adopted in the town, and the overhead system in the outlying districts, has been rejected by ten votes to six.

GERMANY: *Munich Tramways.*—A Consular report states that the net profits of the Munich municipal tramways amounted to £21,170 in 1906-7, which works out at £441 per mile, the system being 48 miles long. The trials of heating the Munich municipal tramcars by means of electricity were unsuccessful on account of the expense.

Electrical Works.—The Bavarian electrical works report full employment for 1907; the deficiency of workmen complained of in other trades does not seem so apparent in this, the number of workmen employed by one important firm in Nuremberg alone having risen from 5,022 in 1905 to 6,345 in 1906, and to 6,700 in 1907, and this increased number of hands was obtained without difficulty.

GOVAN: *Electricity Accounts.*—The accounts of the Electricity Department for the year ended May 15th last, show a credit balance of £629. There has only been a small increase in the output and revenue, which is attributed to the bad state of trade during the twelve months covered by the accounts. Connections have been increased by 4,588 8-c.p. lamps and 1,307 h.p., but the new connections have not done much more than compensate for the decreased business with old consumers. There is an increase in the works and distribution costs, but this is almost entirely due to an increase in the price of coal, the bill for which is higher by £632. The gross revenue amounted to £16,765, and working expenses to £9,055. After meeting interest, sinking fund, &c., there is a small balance, as already stated, of £629.

GRIMSBY: *Supply for Wireless Telegraphy.*—Mr. W. A. Vignoles, the Borough Electrical Engineer, has visited Portsmouth and conferred with representatives of the Admiralty with reference to the wireless telegraph station at Humberstone. A draft agreement between the Electricity Committee and the Admiralty has been approved, and the laying of the necessary cable is to be commenced at once.

HANDSWORTH: *New Tramway Scheme.*—Negotiations are proceeding with the British Electric Traction Co., in connection with a scheme of tramways in Handsworth. A census has been taken of the district by the Company, and they hope to promote a Bill in Parliament next session.

HANWELL: *Condition of Tramway.*—At the last meeting of the District Council the matter of the complaints with regard to the tram track again came up, a letter being read from the Board of Trade stating that they had no power to compel the Tramways Co. to repair or reconstruct its lines. Sir Clifton Robinson, managing-director to the company, wrote calling attention to a report in the Press of the discussion which took

Digitized by Google

place at the previous meeting. That was the first intimation he had received, and he would be glad to have the ground upon which the complaints were made. Sir Clifton Robinson is to be given the Council's ground of complaint.

HASTINGS.—*Sunday Tramways.*—The Tramway Company refuse to abide by the Council's resolution that as a condition for being allowed to run Sunday trams, the receipts on Sundays shall not be taken into account in the event of purchase being made, and consequently has abandoned its Sunday services. The matter does not rest there, however, as the inhabitants are strongly in favour of Sunday tramways. The Corporation have discussed the position, but no definite decision has been come to.

HERNE BAY: *Electric Lighting.*—An application is to be made to the Board of Trade for an electric lighting Provisional Order.

HERTFORDSHIRE: *Tramways.*—The Metropolitan Electric Tramways, Ltd., have paid £1,594 in settlement of interest at the rate of 4½ per cent. per annum upon the outlay of the County Council in connection with the promotion and construction of the Barnet tramways, payable under the terms of the agreement between the County Council and the company.—The plans showing the proposed method of constructing the Watford & Bushey tramway extensions have been agreed with Major Pringle, R.E., on behalf of the Board of Trade. The Light Railways Sub-Committee of the County Council has approved of an agreement with the company, granting a lease of the Bushey and Watford tramways for 42 years as from August 21st, at a fixed rent of £5 per cent. per annum upon the capital outlay incurred by the County Council in construction.

HOBART (TASMANIA): *Heavy Damages for Tramway Accident.*—An action was recently taken against the Hobart Tramway Co. for injuries alleged to have been caused to a boy fifteen years of age, through falling from a tramcar, which was stated to have been caused by the negligence of the company's servants. Damages to the extent of £2,000 were claimed, and after a lengthy hearing the jury awarded £1,200.

HUDDERSFIELD: *Tramway Receipts.*—The half-yearly statement of the tramways undertaking to September 30th shows an income of £44,111 against £44,118 last year, and a total working expenditure of £23,031 against £20,676. After allowing for depreciation at the rate of 3 per cent., there is a net surplus of £2,748, against £5,110 for the corresponding period of last year.

ITALY: *Customs Decisions.*—An Italian customs decision has recently been received at the Board of Trade, under which "carbons for electric lamps with the metallic thread in the interior, destined to facilitate the combustion of the carbon," are liable to a duty of 10 lire per 100 kilogrammes.

Proposed Electrical Exhibition.—An electrical exhibition is expected to be held in Brescia in 1909.

Telephones.—A Consular report states that in 1887 there were only about 100 persons who used the telephone in Milan. The number of telephones was 1,431 in 1895, it rose to 2,749 in 1900, to 6,112 in 1905, to 6,263 in 1906, and at present it is 7,651, with a tendency to increase.

JAPAN: *Electric Railway Statistics.*—The British Vice-Consul of Osako has forwarded some notes and statistics relating to the municipal electric railway in Osako, the second installation of which was opened to traffic on August 1st last. The railway is the first of its kind constructed and worked by a municipality in Japan. The particulars referred to may be seen at the Commercial Intelligence office of the Board of Trade.

LIVERPOOL: *Inspection of Electric Light Fittings.*—A resolution has been passed by the City Council recommending the appointment of an officer whose duty shall be to inspect the electric light fittings in the buildings under the control of the various municipal committees.

LONDON: *London County Council Tramways.*—In addition to the proposals now before the County Council for new tramways, for which a Bill is to be introduced in Parliament this session, the Highways Committee recommend the construction of a line from Streatham High Road via Mitcham Lane to Mitcham Road.

Owing to the Chelsea and Kensington Borough Councils having refused their consents to the construction of tramways from Battersea Bridge to Uxbridge Road, the Highways Committee recommend that this proposed line shall be omitted from the list submitted to the Council.

Marylebone: Consulting Engineer's Fees.—At the meeting of the Council, on October 22nd, the result of the arbitration with regard to the fees claimed by Mr. Wright, the consulting electrical engineer, was announced. The total amount now due to Mr. Wright by the Electricity Supply Committee is £342, exclusive of £85 payable by the Lighting Committee. The arbitrator has awarded that the Council shall pay the fees, amounting to £85, and the whole of the costs.

Poplar: Electricity Accounts.—The report of the Electrical Engineer for the year ended March 31st, 1908, shows a gross profit of £16,920, against £14,576 for the previous year, an increase of 16 per cent. Capital charges absorb £1,470, leaving a balance of £2,750. From this has to be deducted accrued charges on new loans, cost of raising new loans, and interest on bank overdraft, and after adding certain small items, such as income from property and income from sale of lamps, there is a net balance of £2,264. It is necessary to devote this surplus to meeting the deficit on March 31st, 1907; to writing down the original cost of six core-feeders on account of the introduction of the extra high-tension system; and various other items, which leave a balance to be carried forward of £162. Nothing is set aside for depreciation. The net revenue of the undertaking was £33,310, compared with £30,595 in the previous year. The total number of units sold was 5,296,040, at an average price of 1·6d. per unit. The cost of coal exceeded the estimate by £1,539, but as the output was 461,040 units in excess of the estimate, amounting to £701, the increased price of coal was responsible for £838 increase. The total number of public arc lamps is 344, and of 8 c.p. incandescents 575. The maximum demand during the year was 2,600 kw.

MANCHESTER: *Trolley Omnibuses.*—The Corporation will deposit a Bill in Parliament next session authorising them to use trolley omnibuses and to construct certain tramways.

MORECAMBE: *Tramway Undertaking.*—The Corporation has passed a resolution that an application be made to the Board of Trade for a Provisional Order to electrify and run the tramways, which have recently been purchased from the Morecambe Tramways Co.

OLDHAM: *"Black Smoke" Nuisance.*—At the last meeting of the Corporation, a Councillor asked if some steps could not be taken to check the emission of black smoke from the electricity generating station chimney. He urged that experiments should be made with a view to minimising the nuisance. The Chairman of the Electricity Committee stated that endeavours had been made to prevent the emission of black smoke, but he did not suppose that the Council would wish to expend hundreds of pounds by the experiments. He did not regard the trouble as a serious one. Further consideration of the matter was deferred.

POTTERIES: *Proposed New Tramways.*—The Potteries Electric Traction Co. is to be asked by the Smallthorne Urban District Council to construct a tramway from Tunstall to Brindley Ford.

QUARRY BANK: *The Light Railway Scheme.*—It is stated that there is a possibility of the light railway scheme, which has been the subject of negotiation for some time between the Quarry Bank, Brierley Hill, and Rowley Regis Councils and a company, in which Mr. C. S. Vesey Brown is interested, is likely to fall through. One of the Councils has adopted a determined attitude on the question of the security which it is proposed that the company should deposit, this being a considerable sum to remain in a bank during the forty years of the agreement. To this the company strongly object.

RHYL: *Proposed Tramway Extensions.*—The Council has decided to confer with the representatives of the Llandudno and District Light Railways Co. for the consideration of a scheme for tramways in Rhyl.

RUSSIA: *Port Lighting.*—During last year, according to a British Consular report, an electrical installation was completed at the Nicolaieff port.

Tramways.—Negotiations are proceeding for the conversion of the existing horse tramways in Nicolaieff to electric traction.

SALFORD: *New Tramways.*—A Bill is to be introduced into Parliament next session for the construction of two new tramway routes.

SHEFFIELD: *Street Lighting.*—Owing to the success of the electric lighting on the Moor, Fargate, and High Street, the Watch Committee has decided to erect electric lamps in Fitzalan Square.

TURKEY: *Smyrna: Electrical Appliances.*—A British Consular report mentions that electrical appliances, hitherto very strictly excluded, are now being gradually introduced.

WALTHAMSTOW: *Arc Lamp Hiring Scheme.*—A charge of £2 2s. per arc lamp is to be made under an arc lamp hiring scheme, such charge to cover supply of current for 800 hours burning per annum, and maintenance, all hours of burning above 800 per annum are to be charged at 2d. per lamp per hour.

WARE: *Provisional Order Revoked.*—The Board of Trade have revoked the Ware Electric Lighting Order of 1905.

WELLINGTON (N.Z.): *Electric Lighting Accounts.*—The first year's working of the municipal electric lighting department shows a net profit of £6,122 after allowing for interest, sinking fund, and depreciation.

WEST HAM: *Mutual Supply with Charing Cross Co.*—Negotiations have been in progress between the Electricity Committee and the Charing Cross Supply Co., for an interchange of supply between the Bow and Canning Town power stations. The Electrical Engineer states that the method of payment for the interchanged current presents no difficulties because it is proposed to base it entirely on the working costs of each party, the intention being that neither party supplying current shall make any profit on the actual exchange. A schedule will further vary the price according to the time of day current is taken. The two stations are about 2¼ miles apart, and the systems can be connected without any running machinery. The Engineer is to put a draft scheme shortly before the Committee, who have approved of the principle of the interchange, and have instructed him to continue his negotiations with a view to an agreement being entered into.

YORK: *Light Railways.*—The Board of Trade has confirmed the York Corporation Light Railways Order, 1908, which authorises the construction of light railways in the city of York and in the rural district of Escrick.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

CARDIFF.—Upon the recommendation of the Electrical Engineer and Manager, the Electric Lighting and Tramways Committee recommend application being made to the Local Government Board for sanction to borrow £30,000.

DUNEDIN (N.Z.).—Mr. Stark, the City Electrical Engineer, recommends the installation of a generating plant with a total capacity of 2,000 kw. He recommends steam-turbine plant in preference to any other form, at an estimated cost of £21,300.

EASTBOURNE.—The Electrical Engineer has been instructed to make inquiries in regard to obtaining a water-softening plant to deal with 1,000, 2,000, or 3,000 gallons per hour, the estimated cost of which is £200, £250, and £300 respectively. To ensure a permanent supply for the motors driving the condensing plant a spare transformer with a regulating switch is to be provided, so that the normal voltage required by the motors can be obtained should the generator voltage drop so low as 1,500. The cost will be £98.

GREENOCK.—A sum of £25,000 is to be borrowed in connection with the electricity works.

NUNEATON.—A Local Government Board inquiry was held last week into an application of the Town Council for sanction to borrow £2,500 for cable extensions.

SYDNEY.—On the recommendation of the City Electrical Engineer, the Electric Light Committee have decided to recommend that specifications be prepared for new generating plant, and that application be made for powers to borrow £250,000 for electric lighting purposes. Estimates submitted by the engineer are as follows:—Two 4,000-kw. generators at £22,000, £44,000; one 400-kw. generator, £2,750; one 400 kw. transformer, £450; switchgear (at power-house), £2,480; crane, £850; boilers with superheaters and stokers, five at £2,600, £13,000; pipework, valves, feed pumps, economisers, tanks, &c., £7,230; coal and ash conveyor, £1,900; sub-station motor generators, three at £3,200, £9,600; sub-station switchgear, £1,150; sundries and contingencies, 5 per cent., £4,170; total, £87,580. It is estimated that the buildings, chimney, &c., will cost an additional £47,000.

WATFORD.—The Electrical Engineer has been instructed to obtain tenders for certain buildings and pipe work necessary to complete the scheme of extensions for the winter's load, 1909-1910.

A Local Government Board inquiry was held last week relative to the Council's application to borrow £1,830 for improvements and extensions to their electricity undertaking. There was no opposition.

Miscellaneous

ARGENTINA.—The Government has decided to expend 50,000 pesos (about £4,375) upon the construction of telegraph lines in the province of San Juan.

AUSTRALIA.—A poll of the ratepayers of the city of Prahran (V.), in connection with the proposition to borrow £8,500 for tramway purposes, has resulted in only 665 votes against the proposal on a register of 11,171.

BRADFORD.—The Corporation invite tenders for the supply of stores for the tramways department during the year ending December 31st, 1909, including electric lamps for cars and lamp fittings.

DUNDEE.—Messrs. P. & P. Campbell are introducing electric power into their works, and have communicated with the Town Council with regard to a supply. Should the terms not be satisfactory, special plant will be put down.

GLASGOW.—Metallic filament lamps are to substituted for carbon filament lamps in the various corridors throughout the municipal buildings at a cost of £90.

LEITH.—Tenders are invited for the supply of rails, points and crossings, tie-bars, poles, bonds, and overhead fittings, for about three miles of double track. Particulars from the Borough Surveyor (fee one guinea, returnable), and tenders to the Town Clerk by November 10th.

LONDON: *London County Council.*—Tenders are invited for the supply, delivery, and erection of overhead electrical equipment for the electrification on the overhead trolley system of the Council's tramways from (1) Loughborough Junction to Norwood; (2) Hammersmith to Putney, and (3) Streatham to Norbury. Full particulars from the Clerk, fee £2 (returnable), and tenders by November 10th. (See an advertisement this week.)

NEWCASTLE EMLYN.—A number of flame arc lamps for street lighting purposes are to be purchased.

NEW ZEALAND.—It is stated that electrical machinery to the value of £75,000 will be required to complete the Waipori power scheme.

SWITZERLAND.—The Swiss Government have granted to a preliminary committee, composed of Messrs. Muller, Zeerleder & Gobat, of Zurich and Berne, and the Compagnie Electrique Alioth at Munchenstein, the concession for the construction and working of a narrow gauge (1 metre) overhead electric railway, 60 kilometres long, from Gletsch over Andermatt to Disentis (Furka-Oberalp Railway). Of the 14,000,000 francs (£560,000), the sum which it is estimated is required to carry out the work, 1,483,000 francs (£59,320) are assigned for the purchase of steel rails and like permanent-way material, 1,585,000 francs (£63,400) for rolling stock, and 1,055,000 francs (£42,200) for the erection of buildings.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

N.—Music hall, Finsbury Park. Architects, F. Matcham & Co., 9 Warwick Court, W.C.

S.W.—Additions to premises, Chelsea Art Club, 143 and 145 Church Street.

Building for Committee of Homes for Working Girls, Chelsea. Architects, Seth-Smith & Munro, 46 Lincoln's Inn Fields, W.C.

Studio at rear of 13 Kensington Square for Corporation of King's College.

W.—Re-building Harewood House, Hanover Square (£38,000). Joint architects, G. D. Martin, 3 Pall Mall East, W., and D. Blow, 9 King's Bench Walk, E.C.

PROVINCES.

ALTRINCHAM.—Isolation Hospital, Sinderland Road, Dunham Massey. Architect, Wm. Owen, Duchy Chambers, Clarence Street, Manchester.

BARKING.—Factory in River Road for London Butchers' Hide & Skin Co., Ltd., Creeksmith Road, Barking.

BOLTON-UPON-DEARNE.—Chapel (£1,129). Builder, E. E. Dickinson.

BRIGHTON.—Adaption of premises adjoining Montague Place for the Brighton, Hove & Preston United Omnibus Co., Ltd. Architects, Clayton & Black, 10 Prince Albert Street.

BRISTOL.—Additions to premises of General Accident, Fire, and Life Assurance Corporation (£1,320). Architect, W. H. Watkins, 15 Clare Street.

DONCASTER.—Schools for St. Peter's Roman Catholic Church (£3,000). Father A. Leonard.

EASTBOURNE.—Addition to Grand Hotel, Crompton Street. Builder, C. Breach, Matlock Street, Meads.

EAST CLAYDON (BUCKS).—School (130 places) and teachers' home (£1,980). Architect, C. H. Riley, Kingsbury Sub-Office, Aylesbury.

FELLING.—Workmen's Club (£2,250). Architect, H. Miller, Felling.

GLAMORGAN.—School at Hendre (£2,950); school at Abertriotwr (£5,900). County architect, D. Pugh-Jones, Cardiff.

GLASGOW.—Alterations to Hengler's Cirque. Builder, James Orr, East Kilbride.

GOSPORT.—School, Grove Road. Architect, E. J. Trench, Station Chambers, Norwich.

HARROGATE.—Re-building St. Mary's Church and mission room. Architect, A. A. Gibson, 5 Prospect Crescent, Harrogate.

HARROW.—Fifty-two houses, Rosebank and Fernbrook Avenues. Builder, C. H. E. Bridgen.

LLANDRINDOD WELLS.—Fire station. Surveyor, W. A. Millward.

MANCHESTER.—Purchase of Hulme Hall Estate, Plymouth Grove, for new school of domestic economy for Education Committee. Director, J. H. Reynolds.

MATLOCK.—Kursaal at the Fishpond (£8,000 or £10,000). Architects, J. Nuttall, Crown Square, Matlock, and F. W. Ackland Hodge, 101 Gower Street, London, W.C.

PORTSMOUTH.—Proposed nurses' home in connection with Royal Hospital. Architect, C. W. Bevis, Elm Grove Chambers, Southsea.

RUGBY.—Public baths (£4,200). Surveyor, D. G. Macdonald.

STOCKPORT.—High school for girls at Cale Green, for Stockport Corporation (£17,180). Town Clerk, R. Hyde.

WARRINGTON.—Alterations to Garven House for occupation by staff of Health Department. Borough Surveyor, Thos. Longdin, Town Hall.

Additions to works off Wilderspool Causeway. Builders, Fletcher, Russell & Co., Ltd., Palatine Works, Warrington.

New Vestry. Trustees of Holy Trinity Church.

Administrative block at the Sanitary Hospital for the Health Committee of Town Council.

WATFORD.—Additions to Paget Prize Plate Works, St. Alban's Road.

Alterations and additions at Chalk Hill and Sidney Road, for Watford Steam Laundry Co.

WEST HAM.—Additions to Spencer, Chapman & Messel's factory, Silvertown. Builders, G. Munday & Sons, Islay Wharf, Poplar.

Residence, Canning Town, for Women's Settlement (£3,640). Architect, H. Clapham Lander, Effingham House, Arundel Street, Strand, W.C.

WILLENHALL (SOUTH STAFFS.).—School (1,090 places). Secretary, Graham Balfour, County Education Offices, Stafford.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The tender of Messrs. Ritchie, Hart & Co., for the supply of cast-iron pillars, and Messrs. Musgrave & Co., Ltd., for wrought-iron rails for the power station, have been accepted.

CARLIN HOW.—The Skinningrove Iron Co., Ltd., have placed a repeat order with Messrs. Ehrhardt & Sehmer (sole British agents, the Key Engineering Co., Ltd.) for another 700 h.p. single tandem gas engine, to be direct coupled to a 500-volt three-phase A.E.G. alternator.

HULL.—The tender of Mr. W. L. Harrison, of Hull, has been accepted for an electric light installation at the Grammar School, now being erected for the school committee.

LONDON: *London County Council.*—Owing to the Council having accepted the offer of the Charing Cross, West End, & City Electricity Supply Co., Ltd., for the supply of electricity for the lighting of the Victoria Embankment and Westminster Bridge for a period of four years, tenders have been received for purchasing the gas-driven generating plant at the Embankment power house, and that of Messrs. I. Levy & Sons, of Old Kent Road, London, at £450, has been accepted.

The following tenders have been received for six fuel economisers at the Greenwich generating station:—J. Carter & Sons, £3,360; Edwin Danks & Co. (Oldbury) (recommended), £3,378; E. Green & Sons, £3,874; Goodbrand & Co., £3,935; Roberts Bros., £3,957; A. Lowcock, £3,960; Clay Cross Co., £3,990.

The Highways Committee recommend, in connection with the joining up of the turbo-generators, boilers, feed pumps, &c., in the second portion of the Greenwich power station to the switchboard, the extension of some existing contracts to include the material now required. It is suggested that the present contracts with the Edison & Swan United Electric Light Co. for the supply of wiring material should be extended, and also an existing contract for switchgear with Messrs. Spagnoletti, Ltd. The cost is estimated at about £500 for wiring material, and £900 for the switchgear.

The Highways Committee recommend that further special trackwork in connection with the Council's tramways shall be obtained from Messrs. Hadfield's Steel Foundry, at a cost of £22,000.

The following tenders have been received for the manufacture, delivery, and erection at the Greenwich power station, of three electrically-driven boiler-feed pumps: Thwaites Bros., £1,851; Pratchett Bros., £1,865; John Cochrane (recommended), £1,892; F. Pearn & Co., £1,981; A. & P. Stevens, £2,164; Electric Construction Co., £2,220; R. Warner & Co., £2,228; Worthington Pump Co., £2,561.

ROTHERHAM.—The Council has accepted the tender of the Sheepsbridge Coal and Iron Co., Ltd., for 5,000 tons of coal for the electricity works at 5s. 4½d. per ton, also the tender of Earl Fitzwilliam for 2,000 tons at 6s. 6d. per ton. The tender of Kelvin and James White, at £181 10s. 6d., for switchboard extension has also been accepted.

SALFORD.—The Council have accepted the tender of G. Harland Bowden & Co., of Glasgow, at £437, for electric light installation at the Halton Bank School.

TWICKENHAM.—The District Council have accepted the tender of Nursey & Marr, at £1,157, for the electric lighting of the new hospital buildings. The tenders ranged from £1,549 to £1,109.

WARRINGTON.—The Council has accepted the tender of the British Westinghouse Co., Ltd., at £37 10s., for new governor gear.

WATFORD.—The Council have accepted the quotation of the National Boiler and General Insurance Co., for the insurance of new superheaters, increasing the total insurance of the boilers and superheaters from £3,600 to £5,000, at a premium of £6 17s. 6d. The tender of the Worthington Pump Co., amounting to £141 10s., has been accepted for an oil separator.

WEST HAM.—The Electric Lighting and Tramways Committee has accepted the tender of Gunn & Co. to supply 10,000 tons of north country small coal, at 9s. 8d., to be delivered between April, 1909, and December, 1909, inclusive (a considerable reduction on the present price per ton), and 10,000 tons of washed peas at 9s. 6d., to be delivered between January and December, 1909.

COMPANIES' MEETINGS AND REPORTS

VICTORIA FALLS POWER CO.—The first ordinary general meeting was held at Salisbury House, London-wall, E.C., on Friday, the Marquis of Winchester, President, in the chair. The Secretary having read the notice convening the meeting, the Chairman said that he thought those who had studied the accounts (given in our issue for October 15th) would believe that during the period which had elapsed since the company was formed they had more than fulfilled the expectations which were held out in the prospectus. Dealing first of all with the accounts, the Marquis of Winchester said that their cash capital was provided by the issue in equal amounts of shares and debentures, and there had now been issued £800,000 five per cent. first mortgage debentures. Only £175,000 of this amount had been issued, being part of the consideration paid to the Rand Central Electric Works, Limited, for the purchase of that company's plant and undertaking in South Africa. The remainder, namely, £625,000, were subscribed for and allotted in July of this year under the arrangement set forth in the prospectus, whereby subscriptions for an issue of £625,000 debentures at 95 per cent. were guaranteed conditionally upon full allotment of the issue of the £625,000 preference shares. Having dealt briefly with some of the items in the balance-sheet, the Chairman said that a most important statement which he was justified in making was that the capital estimates upon which they have worked from the outset had been proved by events to have been correct, and they now knew that upon the original programme of construction there would be a larger margin than was at first anticipated. Summing up their position, he stated that they had firmly established themselves upon the Rand, that they would shortly be delivering electrical power from two large modern plants, of which one was already earning revenue; that the estimates of cost had not been exceeded; that they had entered into satisfactory contracts in regard to coal supplies; that they had large cash balances; and that their affairs in South Africa are in most capable hands. Besides this they had the Falls in reserve. These were a most valuable asset, and in any estimate of the company's position must never be lost sight of.

With regard to the proposed formation of a company to compete with them in the supply of power on the Rand, the Chairman said their attitude was to oppose this by every means in their power. He could not believe, in spite of the positive statements which had been circulated, that either underwriters in the first place, or private investors in the second, would support a competitive scheme of this character. His own company did not propose to surrender any of the position which they had secured upon the Rand without a struggle which, if necessary, would be strenuous and protracted, and from which, if they were compelled to take part in it, he was confident they would ultimately emerge victorious. The promoters of the new project disclaimed any idea of such a struggle as that which he had indicated. They were representing themselves as quiet, peaceable folk, who were only anxious to put up plant to fulfil certain contracts which they had secured. But he could not believe that a company such as it was desired to promote could limit its operations in the manner suggested. He knew that the contracts at present secured for the proposed company had been accepted at very closely-cut prices, and they must assume that it would naturally be anxious to average these contracts with others giving a higher return. This being so, they were bound also to assume that such a company would eventually try to compete in the sale of power throughout the Witwatersrand, and that cut-throat competition must continue until one or other of the competing companies absorbed or destroyed its rival. This had been the history of competition on every other field, and it was not likely that the Witwatersrand would prove an exception. Recognising the evils of such an undesirable state of affairs, they were determined to prevent it on the Rand by every means in their power. Before any revenue could be earned by the proposed company at least two years must elapse, for, unlike themselves, they would not be able to carry on a large business during the construction period. There must be a long period during which the value of shares would probably depreciate seriously.

He proposed that the report and accounts for the year ended December 31st, 1907, be adopted.

Mr. H. Wilson Fox (Vice-President), in seconding the resolution, outlined the company's policy with regard to the development of the Victoria Falls. This, he said, did not differ from that laid down in the prospectus. They wished to turn to profitable account, on a large scale, at the earliest opportunity, that great reservoir of force; but the accomplishment of this object in point of time, and in point of fact, must depend upon circumstances. But they would not be justified in commencing the transmission works unless the profits derived from the sale of power at a distance from the Falls would exceed those which they could make by sales at the Falls themselves. Therefore, for the present they would endeavour to arrange for the establishment of metallurgical and other industries at the Falls themselves. At the same time their desire to transmit power from the Falls to Witwatersrand could not be realised until two conditions were fulfilled. The first was the grant of wayleaves by the Transvaal Government, and the second was the certainty of a continuous market for their power. With regard to the first, there had been

Digitized by Google

much obstruction, owing to the misapprehension on the part of those concerned as to the real functions of the company. This he had been at great trouble to dispel during his visit to South Africa last year. Since then he must frankly say that the company had received nothing but the most considerate treatment at the hands of the Transvaal Government, and he thought that they might rest assured that, when in the future, having a sufficient number of customers to justify working from the Falls, they went to the Government on the basis that they could supply cheaper than by steam plant, they would receive assistance which would enable that great enterprise to be carried out. With regard to the second condition, which he had laid down, viz., the market for power, this depended on the relative cost at the Rand of steam-produced power, and water-produced power. When they first embarked upon the undertaking, it was upon the assumption that the cost of generation by steam power was higher than experience had since shown it to be. On the other hand, great advances had also been made in the transmission of electricity over long distances, and it did not appear that the limit of voltage had yet been reached, a circumstance to be set against the fact that the cost of generation by steam was not likely to be greatly reduced. Mr. Mershon, their eminent consulting engineer, was continuing to make investigations on behalf of the company, and whereas at the time of the incorporation of the company 80,000 volts was the highest pressure, he had every reason to believe that in a few years' time transmission at 150,000 volts would be possible. The importance of this statement, on the authority of Mr. Mershon, could not be over-estimated, and it was one which possible competitors on the Rand would do well to consider seriously. He need not remind them that in this era of scientific progress, projects which ignorant critics often dismissed as fantastic had a knack of being realised with almost incredible rapidity, and he felt justified in prophesying that in a comparatively short time transmission from the Falls would be possible at a less capital expenditure than it was now possible to transmit over 150 miles. By that time, possibly, a federated South Africa would have been created, and the days of parochial views would be over.

The report and accounts were then put to the meeting and carried unanimously, no questions being asked.

Mr. A. E. Hadley was re-elected a director of the company.

The auditors having been re-elected, the proceedings closed.

DRAKE & GORHAM.—At the annual meeting on Thursday the report and accounts given in our last issue were adopted. The Chairman stated that before arriving at the net profit of £5,861, liberal sums had been written off for depreciation. There was a considerable addition to stock in hand, mainly owing to the development of their tantalum and osram lamp branches. The rate at which these lamps were replacing carbon filament lamps was remarkable, and he had little doubt that their use would become almost universal, owing to the large saving in current which they effected. The Chairman then gave a long list of the various works which the company had carried out during the year.

EDISON & SWAN UNITED ELECTRIC LIGHT CO.—The report for the year ending June 30th, 1908, states that the sum of £41,312 has been brought forward from profit and loss account. Interest on debenture stocks has absorbed £16,157; £9,000 has been set aside as depreciation on freehold and leasehold property, plant, and tools, and £1,505 has been applied in writing down values of stocks. £5,000 have been added to the reserve fund. The result is a credit balance of £9,649, to which must be added the sum of £9,543, brought forward from the previous year, thus making a total of £19,193, out of which the directors recommend the payment of a dividend for the year on the A shares at the rate of two and a half per cent. (being 2s. 6d. per fully paid A share, and 1s. 6d. per part paid A share), amounting to £9,586, leaving a sum of £9,606 to be carried forward. During the year £9,930 of this company's debenture stocks have been purchased and cancelled, resulting in a profit of £1,822. This amount has been appropriated as an addition to reserve against stock depreciation. There has been expended on capital during the year ending June 30th, 1908, £8,147. The shares of the Altrincham Electric Supply, Ltd., have been taken at par as in previous years. This concern continues to show satisfactory progress, and has paid a dividend at the rate of seven per cent. on its shares for the year ended December 31st, 1907. Its indebtedness to this company has been reduced during the year by £1,219. The manufacture of metal filament lamps has been commenced during the year, and promises to yield satisfactory results. Mr. H. Wolfenden and Sir J. W. Swan, D.Sc., F.R.S., retire in rotation, and offer themselves for re-election. The meeting is to-day.

ELECTROLYTIC ALKALI.—The report for the year ended August 31st shows a net profit of £10,411, increased by the balance from last year to £17,252, after allowing debenture interest, depreciation, renewals, &c. There is three years' dividend due on the preference shares, and the directors propose to pay one year's dividend and carry forward £10,255.

MEXICO TRAMWAYS CO.—The balance-sheet of the Mexico Tramways Co. at December 31st, 1907, says the *Financial Times*, shows the following items:—Debit—issued capital, $6,000,000; five per cent. gold bonds, $7,500,000; bondholders for interest, $126,955; loans, $745,857; creditors and credit balances, $240,065; Compañia de los Ferrocarriles del Distrito Federal de Mexico $650,704; profit and loss account (credit balance), less quarterly dividend of 4 per cent. per annum paid November 1st, 1907, $151,701; total, $15,415,280. Credit—properties, securities and contracts acquired, $13,283,772; mules and horses, $21,660; stock of stores on hand and in transit, $517,608; office furniture and fixtures, $5,311; debtors and debit balances, $226,563; Mexico Electric Tramways, Ltd., $1,286,068; cash, $74,298; total, $15,415,280.

MISCELLANEOUS CITY NOTES

BATH ELECTRIC TRAMWAYS CO.—A circular has been issued owing to the fact that many shareholders are believed to be under a misapprehension with regard to the operation of the tramway system at Bath. Although there has been a falling off in the traffic receipts up to the 7th inst., this has been made up by an almost equal decrease in the working expenses. The net revenue for the forty weeks to date is only £219 less than that for the corresponding period of last year. The circular further points out that the company's application for leave to increase the fares on the Weston route has been granted by the Board of Trade, and that this should add substantially to the net receipts.

BUENOS AYRES TRAMWAYS.—A general meeting of the 6 per cent. debenture holders of the Buenos Ayres Grand National Tramways Co., will be held to-day for the purpose of considering the following resolutions: (1) To authorise the directors to increase the amount of the annual sinking fund in order to provide for the redemption of the conversion debenture stock, by a date not later than March 15th, 1958. (2) To sanction a supplemental trust deed. Similar resolutions will be submitted to a meeting of the 4 per cent. debenture holders of the Buenos Ayres New Tramways Co.

CALCUTTA ELECTRIC SUPPLY CO.—An interim dividend of 6½ per cent. per annum upon the ordinary shares has been declared.

COALFIELDS POWER SYNDICATE.—It is stated in *Commercial Intelligence* that under the prospectus of the Coalfields Power Syndicate, which has been formed by coal-mining interests in India, the capital proposed is Rs.21,00,000, divided into 140,000 shares of Rs.15 each. It is proposed to commence forthwith the erection of two power houses each, containing two 1,000-kw. steam turbo-alternators. It is also stated that tentative arrangements have been made in London to raise the capital for the complete scheme, amounting to about £1,000,000.

COMPANY TO BE STRUCK OFF REGISTER.—Notice is given in the *London Gazette* that the name of the Electrical Engineering Co. of London, Ltd., will be struck off the register in three months' time unless cause is shown to the contrary.

MEXICAN LIGHT & POWER CO.—Dr. F. S. Pearson has resigned from the Board. Dr. Pearson, as the President of the Mexican Tramways Company, was taking up negotiations for leasing the Light and Power Company to the Tramways Company, and terms had been agreed. It is now stated that the Mexican Light and Power Company has decided not to adopt the lease. The *Times* correspondent at Montreal states, on the authority of Mr. Charles Cahan, K.C., resident director and general attorney of the Mexican Light and Power Company, that the company's board of directors were unanimous in declining last Tuesday to approve the scheme for leasing the company's properties to the Mexico Tramways Company. The directors declare that under the terms proposed the interests of the Power Company's bondholders and shareholders were not safeguarded, and the lease, while irrevocable so far as the Power Company was concerned, could be terminated on six months' notice by the Tramways Company. The negotiations, according to Mr. Cahan, developed irreconcilable differences between the two companies, and if the lease had been adopted it would have diverted one-half of the surplus net earnings of the Power Company into the treasury of the Tramways Company, without any return. Mr. Cahan says that the Power Company has no difficulty in obtaining all necessary funds independently of the Tramways Company, that it will be able to pay at least 4 per cent. upon its ordinary stock, and that next year it will show surplus earnings of 8 per cent.

NEW ST. HELENS & DISTRICT TRAMWAYS.—A dividend of 1½ per cent. (1s. 6d. per share), on the preference shares, on account of arrears, has been declared, carrying forward £279.

The Junior Institution of Engineers.—At the annual meeting on Monday, October 19th, it was announced that the Durham Bursary for 1908-9 had been awarded to Mr. L. M. Jockel, of Edinburgh, for a thesis on "Electricity in Mining."

Telegraph Traffic.—The cable between Djedda and Souakim was repaired on the 25th inst. On the 23rd inst. the line between Rome and Constantinople once more gave out, and the line between Rome and Pera followed suit on the 26th inst. The Government cable between Cadiz and Teneriffe is being manufactured, and will be laid and open for traffic probably in November or December.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f., quoted on Tuesday night, was £65 to £63 10s. per ton (last week, £61 10s. to £62).

G. M. BODDY & CO.—This firm inform us that they are supplying 50-c.p. 200-volt lamps with a considerably smaller bulb than hitherto. The bulb is not much larger than that of the ordinary low-voltage metal filament lamp.

"BRONSKOL" BRUSHES.—Mr. C. Conradty has purchased the business of the Aktiebolaget Bronskol Co., of Stockholm, and is now in a position to supply "Bronskol" brushes for dynamos very promptly The sole agents for Mr. C. Conradty for this country and the colonies are Sloan Electrical Co., Ltd., of 15 Fore Street Avenue, London, E.C., to whom all communications should be addressed.

THE EDISON & SWAN UNITED ELECTRIC CO., LTD.—This firm informs us that they are now in a position to supply auto-transformers, in standard ranges and voltages, from stock. These transformers have been made entirely at the Ponders End works.

FRANCO-BRITISH EXHIBITION AWARDS.—The International Jury of the Franco-British Exhibition have awarded two Gold Medals to Messrs. Hans Renold, Ltd., for their display of driving chains in the classes, (*a*) apparatus for the transmission of power, and (*b*) machine appliances and accessories.

OLIVER ARC LAMPS.—We are requested to state that the "Oriflamme" lamp is not the only type of flame lamp in use at Dundee, as stated in an advertisement recently through a misapprehension.

PERMANENT MAGNET AND MAGNET STEEL.—A correspondent desires to be placed in communication with makers of permanent magnets and magnet steel of the best quality.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The statement of affairs in the bankruptcy of Messrs. Meldrum Bros., Ltd., shows a deficiency of £114,611. There are at present large contracts in hand, which are being executed. The Official Receiver attributes the failure largely to the lock-up of capital in the Société Meldrum.

Notice of an intended dividend in the bankruptcy of G. H. Smith, electrical engineer, of 15 Ashley Road, Altrincham, is given. The last day for receiving proofs is November 7th. The name of the trustee is J. G. Gibson, Byrom Street, Manchester.

In the bankruptcy of Thomas Ward, late director of the Electrical Instrument Manufacturers, Ltd., 22 Totteridge Road, Enfield Wash, Middlesex, late Freezywater, Waltham Cross, Herts, the accounts filed show unsecured liabilities £1,161, and no assets.

Science Institute for Bombay.—According to the *Times*, Mr. J. Sassoon has offered a sum of £66,660 towards the founding of a science institute in connection with Bombay University. Sir George Clarke has accepted the offer, which, together with the gift of Sir Cowasjee Jehanghir for a like purpose, will enable a start to be made at once.

Electrification of the Bavarian Railways.—According to a British Consular Report, the cost of the electrification of the first three lines to be taken in hand, will be as follows:—Salzburg - Freilassing - Berchtesgaden - Königsee (28 miles), £259,670; Garmisch-Mittenwald-Scharnitz (15 miles), £53,174; Garmisch-Griessen (9¼ miles), £51,166; which gives a total of £364,010. The total length of the railway system south of Munich is about 350 miles, and in all some £2,375,000 will be required for its electrification.

The Journal.—The October number of the *Journal of the Institution of Electrical Engineers* concludes Vol. 41, and contains the following Papers, read at meetings of the Institution and its local sections, together with the discussions thereon:—"The Manufacture of Electrical Condensers," by G. F. Mansbridge; "Switchgear Control Apparatus and Relays for Alternating Current Circuits," by Dr. C. C. Garrard; "Recent Progress in Tungsten Metallic Filament Lamps," by H. Hirst; "Polyphase Induction Motors: The Choice of Type," by G. Stevenson; "The Design and Use of Telephone and Telegraph Cables," by F. Tremain; "The Management of Engineering Workshops," by E. Thomas. In addition to these Papers, all of which have been fully reported in our columns from time to time, the following Papers read before the students' sections are published:—"The Electrification of the Mansfeld Copper Mines," by H. R. Speyer, a Paper founded on an article by the same author, which appeared in ELECTRICAL ENGINEERING, Vol. II., pages 570, 609, &c.; "Electricity and Matter, with some account of Radiations," by L. H. H. Carr, a remarkably clear, non-mathematical *résumé* of modern theory; "The Brown-McKenzie System of Electrical Block Signalling on Railways," by A. Hamilton; "The Motor Converter," by H. W. Gregory. The annual report and the proceedings of the annual general meeting and the special meeting called to sanction the purchase of the new home of the Institution, are also included, together with obituary notices of a number of prominent deceased members.

APPOINTMENTS AND PERSONAL NOTES

The Watford Urban District Council at their last meeting received an application from Mr. W. S. Stafford, station superintendent, for an increase in his salary, which was now £120 per annum, but the Committee reported that they were unable to see their way to alter the scale of salaries at present in force. The Council, however, decided, on the recommendation of the Committee, to add £30 to Mr. Stafford's salary during November, in consideration of the services rendered by him as Acting Chief Engineer prior to the appointment of Mr. Purse.

Mr. L. G. Butler, of 28 Ennis Road, Plumstead, has been appointed by Woolwich Borough Council Junior Charge Engineer, on probation for three months, at a salary of £90 per annum. At the completion of the probation Mr. Butler's salary is to be increased to £100 per annum, rising by annual increments of £10 to £140.

Mr. J. K. North, manager of the late Rossendale Valley Tramway Co., has been engaged by the Bacup Corporation, upon the acquisition of the undertaking, until the system has been converted to electric traction.

The Darwen Town Council have decided to increase the salary of Mr. Joseph Boyce, Assistant Electrical Engineer, from 45s. to 47s. 6d. per week.

The Bristol Corporation require a charge engineer with experience of E.H.T. (three-phase) and H.T. (single-phase), and direct-current systems and large turbine units. (See an advertisement.)

Fowler's Mechanics' and Machinists' Pocket Book and Diary, 1909. Edited by W. H. Fowler. (Manchester: Scientific Publishing Co.) 6d. net.

"Dynamo Electric Machinery." By C. E. Ashford, and E. W. Kempson. (Cambridge University Press.) Price 3s. net.

Oxford University: Electrical Laboratory.—The *Times* states that the offer of the Drapers' Company to build for the University a new electrical laboratory at a cost of £22,000, and to expend a further sum of £1,000 on its equipment, has been gratefully accepted by the University authorities.

TENDERS INVITED.

COUNTY OF LONDON.

LONDON COUNTY COUNCIL TRAMWAYS.

THE LONDON COUNTY COUNCIL invites tenders for the supply, delivery, and erection of overhead electrical equipment for the electrification, on the overhead trolley system of traction, of the Council's tramways from (*a*) Loughborough Junction to Norwood, (*b*) Hammersmith to Putney, and (*c*) Streatham to Norbury.

Full particulars and also information as to the conditions to be observed by tenderers will be given in the *London County Council Gazette* of 26th October, 1908, and subsequent issues. The Gazette, which is published weekly, contains particulars of all the tenders invited by the Council, and can be obtained from Messrs. P. S. King and Sons, 2 and 4, Great Smith Street, Westminster, S.W., price 1*d*., post free 1½*d*., an issue, or for the whole year a prepaid subscription of 6*s*. 6*d*.

Tenders must be upon the official forms to be obtained from the Clerk of the Council, at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council, of a sum of £2 for the specification, &c.

This fee will be returned only if a *bona fide* tender shall be submitted. No tender received after 11 a.m. on Tuesday, 10th November, 1908, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who shall on any previous occasion have withdrawn a tender after the same had been opened, unless the reasons for the withdrawal were satisfactory to the Council.

G. L. GOMME,
Clerk of the London County Council.

County Hall,
Spring Gardens, S.W.

Metal Filament Lamps.

THE "METALIK"

THE BEST 200-250 VOLT LAMP

Please write for particulars of the SPECIAL DISCOUNTS we have arranged for CORPORATIONS and the TRADE.

Messrs. G. M. BODDY & Co.,
Newington Works, LIVERPOOL. *June 23rd, 1908.*

Dear Sirs,

Answering your last letter we can tell you that the lamp No. 3 is now burning **3,170** hours and is still in good condition (sloping position, alternating current, 220 volts). As we have not made any photometric test on this lamp we cannot say exactly how many per cent. the candle power decreased, but we do not think it is much.

We remain, dear Sirs,
Yours truly,
.....*Manager, Electricity Works.*

The originals of the following letters are in the hands of the Editor of "ELECTRICAL ENGINEERING."

Messrs. G. M. Boddy & Co.,
Liverpool. *June 6th*, 1908.

Dear Sirs,

In reply to your letter of the 4th inst., we beg to inform you that we tested three "METALIK" lamps 220 volt, 50 c.p. in a sloping position burning with alternating current. These lamps were burning continually without switching in and out more than about once every 100 hours. The life of the first lamp was 970 hours, of the second 1,856 hours, while the **third lamp is already burning 2,775 hours,** and is *still in good condition.* The light of the lamps is not materially less than as they were new. The blackening of these lamps is practically so slight that we may say there is no blackening.

Electricity Offices .....
Messrs. G. M. Boddy & Co., *March 9th*, 1908.
Liverpool.

Dear Sirs,

Some time ago we had two samples 50 c.p. "METALIK" Lamps from you for testing purposes. These lamps have an average life of 1,407 hours, and would have run longer had not the filaments become shorted by twisting.

We shall be glad to have your best price for the supply and delivery carriage paid at our.....Stores of "METALIK" lamps in the 32 c.p. size suitable for series burning on a 230 volt direct current circuit.

Yours faithfully,
.....*City Electrical Engineer.*

Corporation Electricity Works,
Messrs. G. M. Boddy & Co., ..., *May 28th*, 1908.
Liverpool.

Dear Sirs,

In reply to yours of the 27th inst., so far your "METALIK" lamps have been burning very satisfactorily and shall be obliged if you will **quote me your best price for 100 lamps, as we shall probably be wanting some more before long.** Yours faithfully,
.....*City Electrical Engineer.*

THE

MANCHESTER ELECTRICAL EXHIBITION

OF

1908

FIFTH NOTICE

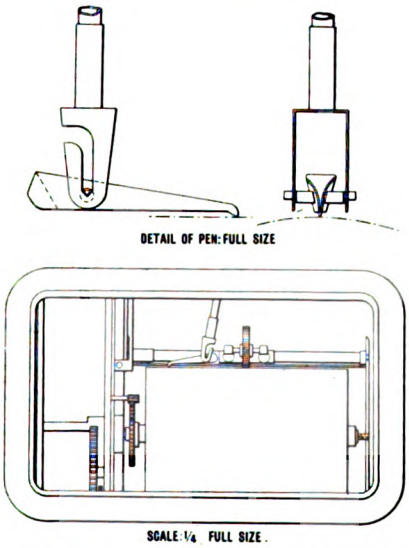
A GOOD test of the effectiveness of the emergency lighting arrangements at the Exhibition was afforded on Saturday last. At 6.45 the sub-station was suddenly switched off from a cause which is explained in a note in the body of the paper this week, but the emergency lighting circuits (supplying 22 lamps for general illumination), which are left permanently connected to a small gas-driven set on Messrs. Crossley Bros.' stand, remained alight. Although the Exhibition was very full, there was no panic of any sort and no confusion among the visitors. The sub-station was entirely switched in again in 8½ minutes and the supply restored.

We give below descriptions of a number of exhibits which have not yet been described in our previous Supplements:—

Eversheds & Vignoles, Ltd.,

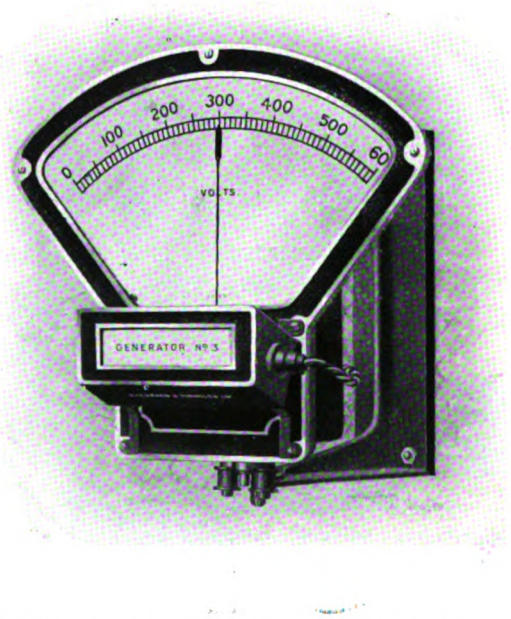
ACTON LANE WORKS, CHISWICK. (STAND NO. 226.)

Instruments.—This firm's exhibit is on the stand of Messrs. G. A. Steinthal & Boydell, Ltd., their Manchester agents. One of the new instruments on view is the Murday recording instrument, which is made either as a voltmeter or ammeter. Our illustrations show an elevation of the paper roll and pen as seen through the window, and also the detail of the pen itself, and it is seen that the interesting feature is that the pen travels on the top of the roll parallel to its axis, so that the chart has straight instead of curved lines. The Murday patent covers the construction of a form of pen which presents several novel features. Its inking mechanism is analogous to a drawing pen carried on knife edges at the extremity of the index, with an



Elevation of Paper Chart and Pen, as seen through Window.

axle perpendicular to the plane of motion. The chart, which is of the "continuous-roll" type, passes from one spool up over a driving wheel of special construction, and down to the receiving spool on which the record is wound. As already stated, the pen works on the horizontal surface of the paper formed at the summit of the driving wheel, and since its motion is in a straight line, and not an arc of a circle as usual, the time lines on the chart are also straight lines, and the record has thus rectangular co-ordinates. The pen can be slipped out in a moment, cleaned instantly in the same manner as a drawing pen, and reinserted—the whole operation being completed in a few seconds. The friction on the paper, we are informed, is uniform and very small. The contact does not depend on the level of the instrument, and cannot be disturbed by vibration; and the record is thus perfectly uniform. This movement is combined with an Evershed moving coil indicating mechanism



Evershed's Sector Moving Coil Voltmeter, showing Method of Illumination.

of peculiarly robust character, the forces being made very large by a very powerful field and large moving coil. The whole mechanism is enclosed in a cast-iron case of strong construction, easily opened, yet watertight when closed. The usual glass window allows of the inspection, both of the position of the index and the past record. Simple means are provided for the removal of the record when required; and the operation of inserting new paper rolls is very easily effected. The whole design is characterised by strength and simplicity. The shunts used with the instrument have only 0·25 volt drop, and a new construction (due to Mr. Vignoles, who has applied for a patent) renders them very small for the load they carry.

Our other illustration shows the firm's sector-shaped illuminated dial voltmeter. It is lighted from the exterior; the lamp is placed in the box in the front of the instrument, the inner surface of which reflects the light upon the scale. The window in the front of the box, bearing the name of the generator or feeder, is also illuminated by the lamp.

Ferranti, Ltd.,

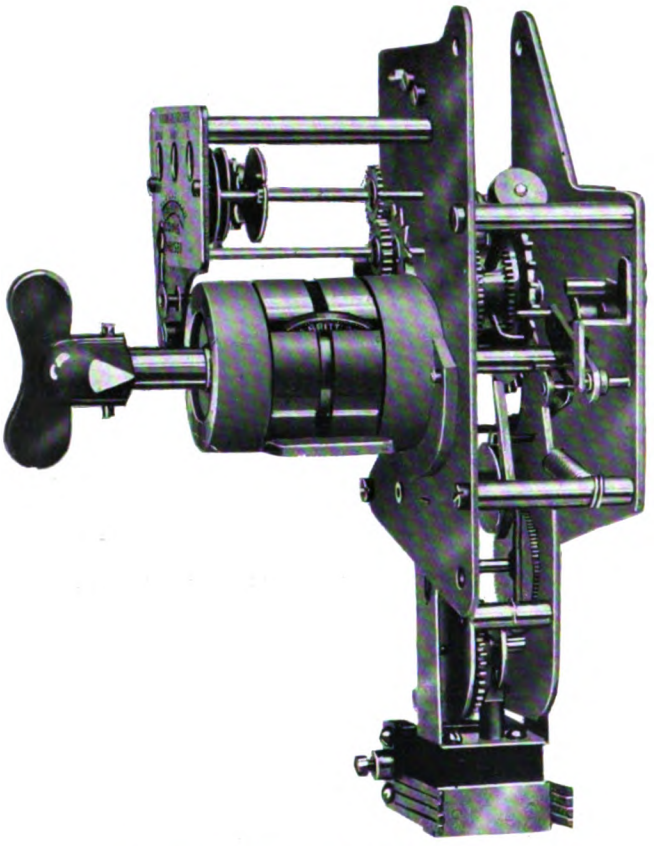
HOLLINWOOD, LANCS. (STAND NOS. 80 & 102.)

Switchgear.—We have already described and illustrated in our issue of October 1st the two fine switchboards which have been supplied by Ferranti, Ltd., for the Exhibition sub-station. Adjoining the sub-station the firm has a stand on which other specimens of well-designed and equally well-finished switchgear are exhibited. Among these is a power and lighting switchboard destined for the firm's own works at Hollinwood. A switch to which much attention is given is a mechanically-operated oil switch for heavy currents. In the case of heavy mechanically-operated switches, there is always a trouble in synchronising, owing to the time necessarily taken in pulling over

Digitized by Google

the heavily-loaded lever, and perfect synchronising is thus rendered difficult. This is overcome by giving the switch a "half-cock" position. The lever is of the railway signal-lever type, and is locked when pulled into the half-cock position. It is released to enable the switch to be pulled right over by depressing a pedal with the foot, so that the machine can only be switched in deliberately, and when switching on to the half-cock position the attendant cannot overstep the mark. Switching off is done by a tripping lever underneath the handle of the switch. In the case of the firm's electrically-operated remote control switch for synchronising, a hand-wheel is turned against a spring controller with the "make-ready" position, and is locked there by a catch. On being released by a button being pressed the spring rotates a contact drum, which closes the circuit of the operating solenoid for a definite short period (about two seconds) and then opens it. This is, therefore, the equivalent of a free-handle device, preventing the possibility of the switch being held on against a short circuit. Other exhibits are an isolating switch interlocked with the main switch, and a circuit breaker with two tripping coils, one acting instantaneously at over 500 per cent. overload, and the other working in conjunction with a time-limit relay for smaller overloads.

Meters.—Ferranti meters of all patterns are shown in sections, so that the complete method of working can be followed out. A



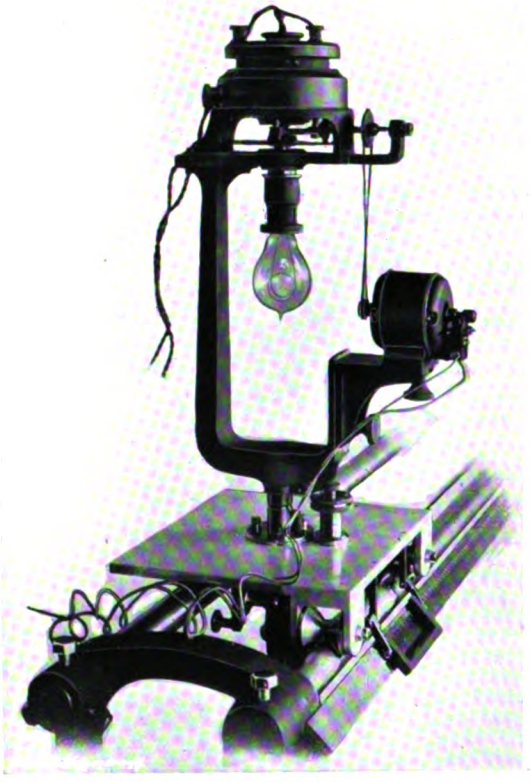
Ferranti Prepayment Meter Mechanism.

new meter is the Ferranti prepayment meter. It is one of the firm's standard type, fitted with the additional prepayment mechanism, which we illustrate. The insertion of the necessary coin in the slot enables the handle to engage with the switch lever, and, on turning the handle, current is switched on by the switch at the bottom and at the same time moves a ratchet-wheel one tooth onwards. This wheel is at one side of a differential gear, the other side of which is connected to the meter train, and on the small wheel of the differential is a weight. The weight is therefore lifted. When the weight reaches its original position again through the rotation of the meter through a predetermined amount (for the ratchet-wheel is now held and the middle wheel of the differential rotates back with the meter) it bears on a lever which releases the switch. An important point is that the switching-off puts no load on the meter, as the lever does not act directly on the catch which holds the switch on, but through gearing. Any number of pennies up to twelve may be inserted consecutively, and the weight is lifted up a corresponding number of teeth. Although difficult to describe in black and white, the action is very simple and also very certain.

Alexander Wright & Co., Ltd.,

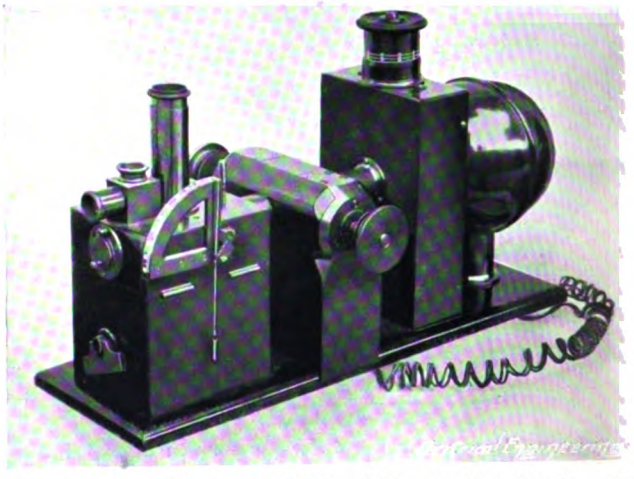
1 Westminster Palace Gardens, Artillery Row, Victoria Street, London, S.W. (Stand Nos. 199 & 202.)

CO_2 Recorders.—In the Simmance-Abady CO_2 recorder, which is exhibited in action, a charge of flue gas is drawn into a bell by a syphonic action from 15 to 25 times an hour (a period



Paterson Lamp Rotator.

which can be regulated at the will of the user). By means of an open tube which is drawn in and out of an adjustable sealing vessel, which seals a vent from the gas bell, a definite amount of gas is imprisoned. This is bubbled through a caustic potash solution which absorbs the CO_2, and causes a small moving bell to rise proportionately to the amount ab-



Direct-reading Portable "Flicker" Illumination Photometer.

sorbed. A flat brass-plate is attached to the top of this second bell, and a few seconds after it has risen, an arm attached to a pen is released by a float mechanism in connection with the syphon arrangement, and a stroke is made on a travelling strip of paper. The height of this stroke is proportional to the CO_2 absorbed. A feature of the instrument is that an interval is allowed between the raising of the bell and the movement of the pen, and this permits the heat of chemical combination

(Brooke's Patent.)

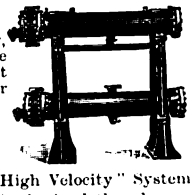
Heating Feed Water, &c., by Live or Exhaust Steam, or (as illustrated) by both.

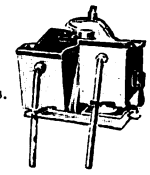


Feed Water brought up to practically *Boiler Temperature* itself.

By our "High Velocity" System far greater heat is obtained than by any other.
See List 156 E.

Leinert's Liquid Meters.
(Patent.)

Free from Complications.



Action and all parts visible.
See List 144 E.

Automatically measure and record (by actual weight) Water, Oils, and other Liquids. Accuracy not affected by changes in temperature and specific gravity of liquids dealt with.

Automatic Vacuum Dischargers.

See List 72 E.

For automatically draining and discharging water or other liquids from any Chamber under Vacuum, such as Oil Separators, Exhaust Steam Pipes, &c.

Steam Dryers.
(Brooke's Patent.)

See List 140 E.

No rivets.
No leaky seams.

The *only ones really reliable* with *high pressures* and *superheated steam*

Injectors.

See List 137 E.

For all pressures and for *Hot Water*. Started and regulated by *one movement*.

Steam Traps.
(H. & B's Improved.)

See List 126 E.

Renewable Valve Seat.
Automatic Self-Grinding Valve.

Steady working with definite intermittent discharges.

Also Manufacturers of: PUMPS, COMPRESSORS, "PROTECTED SEAT" VALVES, EXHAUST HEADS, WATER LIFTERS, EJECTOR HEATERS, SIRIUS TRAPS, INJECTORS FOR ALL PURPOSES, &c., &c.

Digitized by Google

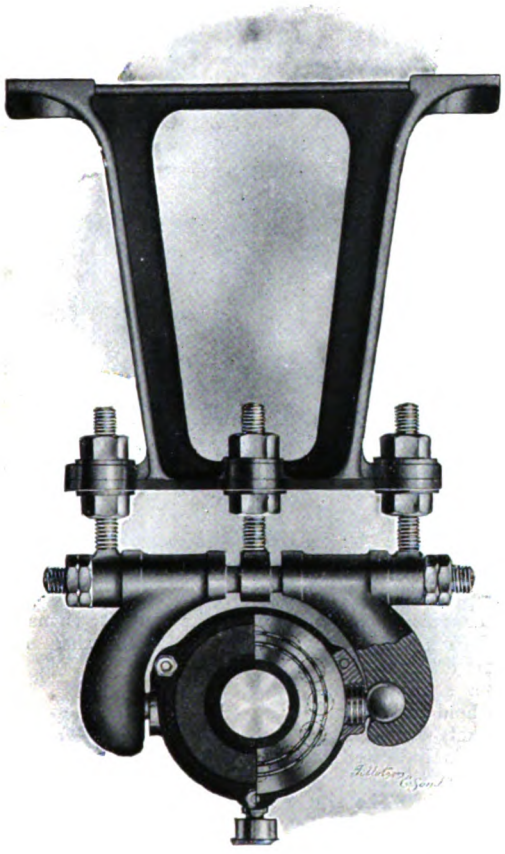
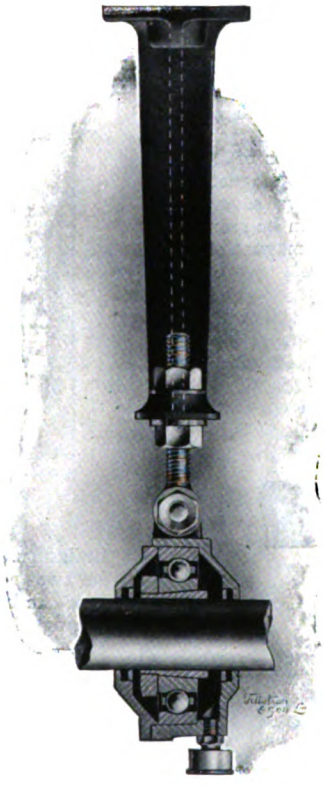
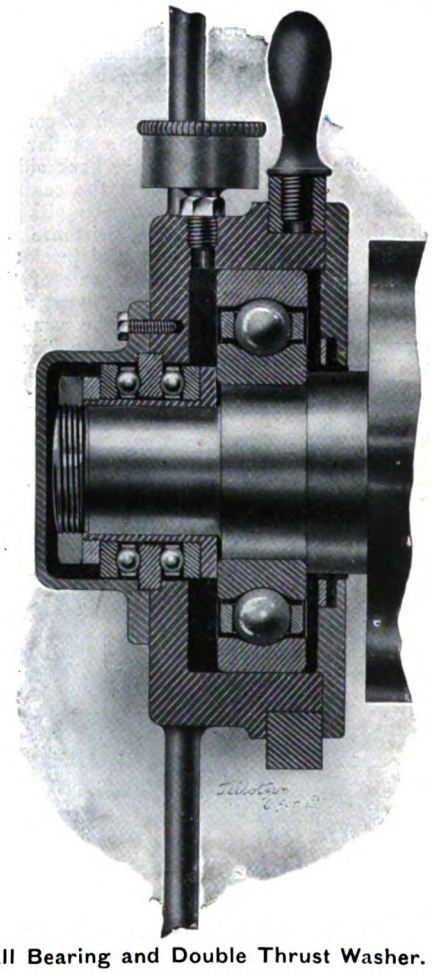
to disperse and incidentally also causes as long a contact with the caustic potash as possible. The caustic potash need only be changed six times a year. Mention should also be made of the extremely ingenious and simple continuous paper feed.

Photometers.—The largest exhibit on the stand is a facsimile of the large photometer bench supplied to the National Physical Laboratory, with a lamp rotator, designed by Mr. C. C. Paterson, of the N.P.L. The latter is of the mercury-bath type, and is designed to revolve lamps (which are suspended vertically) at a speed from 30 to 400 r.p.m. Contact is made by amalgamated copper-collecting rings revolving in a mercury cup in the casting seen at the top of the illustration. The drive from the top pulley to the lamp spindle is by friction, and the speed is adjusted by altering the position of the friction pulley. The motor can be run from cells at from four to six volts. In the direct-reading portable "flicker" photometer, illustrated, the standard is a 15 mm. square of illuminated surface coated with barium sulphate. By a mechanical micrometer movement scaled into 300 equal parts the illuminated surface can be partially obscured, so that a standard of light can be obtained varying in small steps by 0·003 of a candle foot. A small metal-filament lamp is employed to illuminate this surface, and the voltage is regulated by a rheostat, so that the light of 3-ft. candles is obtained with the screen fully opened, and by adjusting the micrometer movement until balance on the "flicker" disc is obtained, the illuminating effect in foot candles is read off direct without any calculation. The firm is also showing draught indicators, and also pressure and vacuum recorders fitted with the simple system of paper feed already referred to.



Swivelling Shafting Hanger with Ball Bearings.





Ball Bearing and Double Thrust Washer.

The Hoffmann Manufacturing Co., Ltd.

CHELMSFORD, ESSEX. (STAND NOS. 126 AND 165.)

Ball Bearings.—A very effective exhibit, illustrating the various patterns of ball bearings manufactured by this firm, and their application to different types of electrical machinery, has been arranged. Pumps, fans, polishing spindles, electrically-driven and fitted with ball bearings, are to be seen; and a length of shafting fitted with Mair's patent swivelling hanger is also exhibited. The objects and advantages of this shafting hanger, which we illustrate, were fully described in our issue of October 8th last, in connection with the installation at Messrs. W. H. Smith & Sons' bookbinding works at Letchworth Garden City. Our other illustration is that of a ball-bearing and double-thrust washer for medium-sized electric motors. The view shown is of the commutator end, as is evidenced by the brush-rocker. The double-thrust washer holds the shaft endways, and the outer races of the journal bearings are allowed to slide in their housings, so that they can arrange themselves exactly opposite the inner ball races which are fixed to the shaft. For small motors under 10 b.h.p. thrust bearings need not be provided, but then one outer race must be fixed so as to fix the shaft endways. A little grease should be occasionally forced into such bearings as these, and if this is done, it should, with the leather dust-washers shown in the illustration, prevent the access of all dust and moisture to the bearing. A very small starting effort is required when ball bearings are used; this is strikingly demonstrated by the "Stiction" apparatus shown on the stand. Three hard steel spindles are running in steel, gun-metal, and ball bearings respectively, and when a certain load is put on the spindles, it is almost impossible to rotate any spindle but that with the ball bearings. The large G.E.C. "Witton" machine at the Exhibition sub-station is fitted with Hoffmann ball bearings.

Elliott Brothers,

CENTURY WORKS, LEWISHAM, S.E. (STAND NO. 85.)

Instruments.—A very representative selection of switchboard instruments is shown under working conditions, in conjunction with the exhibit of switchgear by Messrs. Eckstein, Heap & Co., the Manchester agents of this firm. Among these are several sector and edgewise type instruments with illuminated dials. The alternating-current instruments are of the dynamometer pattern, but with two coils instead of three. In the ordinary dynamometer, the moving coil swings inside the fixed coils; but in these instruments the moving coil swings outside the fixed coil, which is in the form of a ball. The torque is increased owing to the better arrangement of the coils, and this allows of stronger controlling springs being used, with a coil of relatively low weight and inertia. Portable ammeters, with Campbell's device for compensating for temperature, and recording instruments are exhibited. These latter comprise three separate parts—the case, the clock mechanism, and the electrical

Digitized by Google

movement—and any one part can be quickly replaced if damaged. Among the recording instruments exhibited is one fitted with a tell-tale device for ensuring that readings are taken continuously throughout a certain period, as, for instance, during the night. A new pen for marking recorder charts is also shown. Various forms of the firm's well-known testing sets are exhibited, including a mains-testing set, a fault-localising bridge, and a rail-bond testing set. The Elliott speedometer is shown working, but the action of this instrument, which indicates both speed and distance travelled, is purely mechanical.

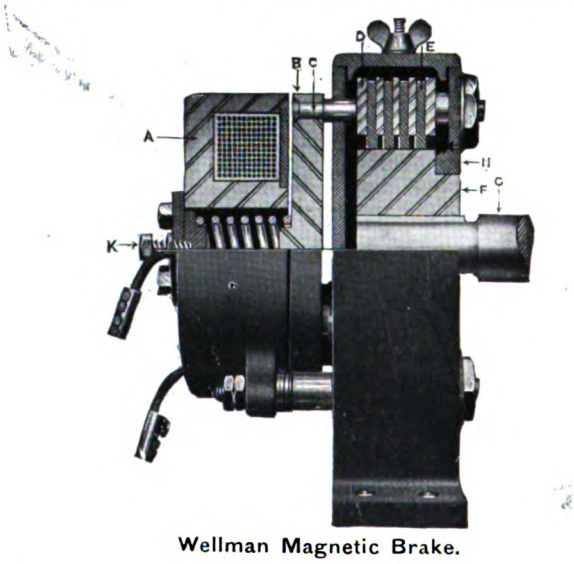
D. C. Bate,

40 Brazennose Street, Manchester. (Stand No. 284.)

Two or three firms are represented by D. C. Bate in Manchester, and exhibits of these firms' specialities are to be seen on this stand, together with a general exhibit by D. C. Bate. The exhibit of Messrs. Mawdsley's, Ltd., one of the firms mentioned, was described on page 17 of the supplement.

Motor Controllers.—A representative collection of "Dinkey" motor starters and controllers is shown by Messrs. Wellman-Seaver & Head, of 47 Victoria Street, London, S.W. The steel contact arm of this pattern of controller is provided with a series coil at its centre, and a similar steel arm is fitted to a projection of the spindle on the back side of the contact board. A strong blow-out field across the contacts is obtained in this manner. The resistances may be either of the grid or coil pattern; the latter consist of resistance wire wound on an iron tube, and embedded in a special insulating material, which is a good conductor of heat. In some of the patterns of starters the resistance coils are arranged to act as blow-out magnet coils.

Wellman Magnetic Brake.—The same firm have several examples of the "Wellman" brake on view. As can be seen from the illustration which we give, this consists of a magnet coil, *A*,



Wellman Magnetic Brake.

an armature plate, *B*, the studs, *C*, which transmit the pressure exerted by the spring to the friction plates, *D* and *E*, and a hub *F*, to which the friction plates, *E*, are keyed. The plates, *E*, are free to move longitudinally. The hub *F* is keyed to the end of the motor spindle *G*. *H* is an oil slinger, and *K* an adjusting screw. The brake works as follows:—With the motor at rest, no current passes through the coils, and the studs, *C*, press the friction plates together. On switching on the current the plate *B* is attracted to the magnet, and the friction plates are released. The revolving discs dip into oil at the bottom of the case, and keep the whole flooded with oil. This prevents jarring and sticking of the brake.

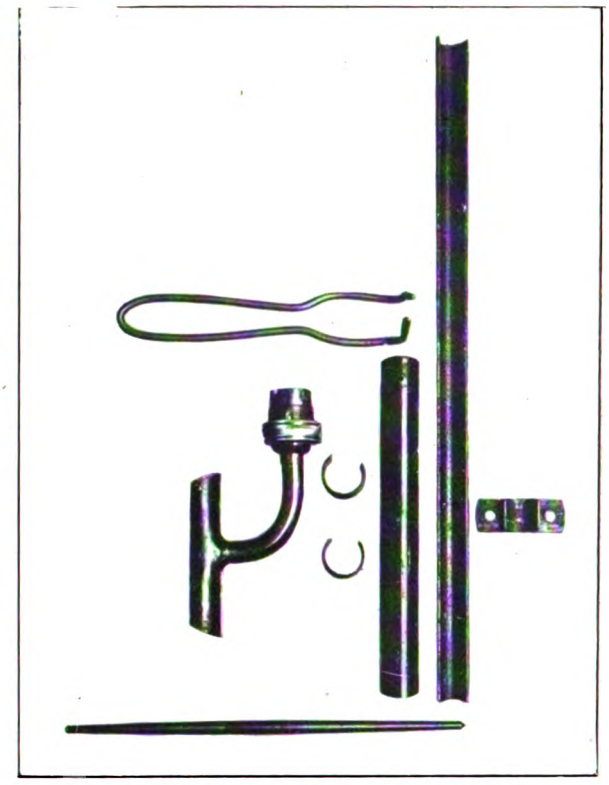
Nodon Electric Valves.—A battery of these electrolytic rectifiers is shown working, and a small continuous-current motor is being run with the rectified current from the alternating-current supply.

Schniewindt Woven Resistances.—A selection of the asbestos woven wire resistances manufactured by C. Schniewindt, of Neuenrade, Westphalia, is exhibited. Some controllers, motor starters, and other pieces of apparatus in which these woven resistances are used are shown; and bare wire-woven nets and strips for heavy currents are also exhibited.

Lift Equipment.—A complete lift equipment, with push-button control, is shown in operation; the load is obtained by means of a "Wellman" brake attached to the spindle of the lift motor, which is of the Mawdsley "Zone" pattern. The feature of the controller in use with this equipment is that the arm of the solenoid starting switch only completes relay circuits, the main current being controlled by a series of solenoid operated switches. The lift is provided with a floor contact, which renders all the push buttons inoperative when the lift is occupied.

Key Spring Conduit Demonstrations.

We referred briefly in our Exhibition Supplement of October 15th to the new "Key Spring Conduit" for surface-wiring in



Conduits and Fittings unassembled.

buildings. The conduit tube, which forms the conduit, is made in two portions, each slightly over a semicircle, so that one half can be sprung over the other. Spring clips on a similar system are employed to hold up the conduit against brackets on the wall. The arrangement is indicated in one of the two illustrations which we now publish. The two halves of the conduit are marked 3; 5 is the bracket for fixing the conduit to the walls; the springs, 2, clip the conduit to these brackets; 4 is a bracket lamp constructed to spring on the conduit; 1 is a key for removing the fittings from the conduit; and 6 a tool for removing the cover from the lower half of the conduit. To show the ease and rapidity with which the conduit can be assembled, timed demonstrations are given at the stand (No. 281) of the Key Engineering Co., Ltd. A switch, bracket lamp, three-light ceiling fitting, pendant fitting, and 20 ft. of conduit are erected in less than 2½ minutes.

Conduits and Fittings assembled.

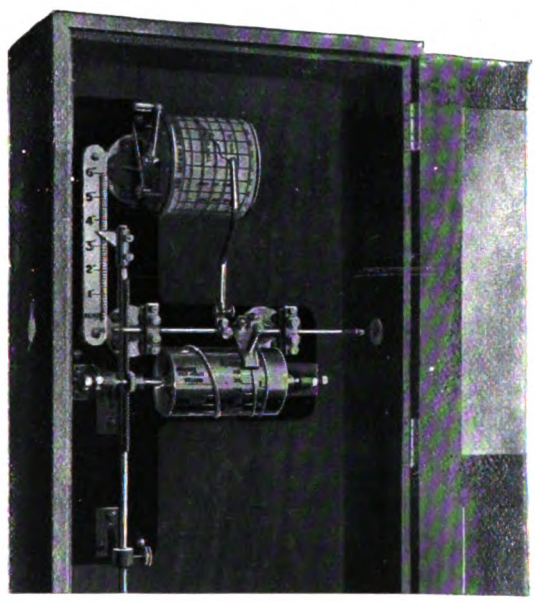
Jas. E. Lea.

28 Deansgate, Manchester. (Stand No. 179.)

Steam or Water Recorders.—One of these recorders is shown in operation, indicating the rate of flow of a liquid, and recording the quantity which has passed during any interval of time. The recorders are used in many central stations to determine the steam consumption of generating plant by measuring either the feed-

Digitized by Google

water or the condensed steam. The principle of the instrument is the fact that the rate of flow of water through a V notch can be accurately determined if the height of the water level above the apex of the notch is known. This last can be determined by a float. The accompanying illustration shows a standard 6 in. recorder. To the float is attached a spindle, which passes through the bottom of the instrument case. Upon this float spindle is a rack which gears into a small pinion upon the axis of a drum. Upon the body of this drum is a screw thread, the contour of which is the "curve of flow" for the V notch, in connection with which the instrument is used; and, just as the flow through a notch increases rapidly with the depth, so the pitch of the screw increases in the same proportion. Above this spiral drum is a horizontal slider bar, carrying an arm, at the upper end of which is a pen or pencil point, in contact with a chart paper upon a clock-driven recording drum, which, as a rule, revolves once in 24 hours. As the float rises, the spiral drum is rotated, and its motion is imparted to the slider bar and pen arm by means of a saddle arm projecting from the latter, and engaging at its lower end with the screw thread. On the body of the spiral drum is a graduated scale, adjacent to the screw thread, and marked out in pounds per hour. Thus



Standard "Lea" 6 in. Recorder.

the actual depth of water in the notch, the rate of flow in pounds per hour, or the total quantity passed, can be quickly determined. For the last measurement the area of the rate of flow diagram is measured. When applied to an electric generating plant, the steam consumption per kw. hour can be determined at once by comparing the rate of flow of condensed steam with the watt-meter reading.

Worthington Pump Co., Ltd.,

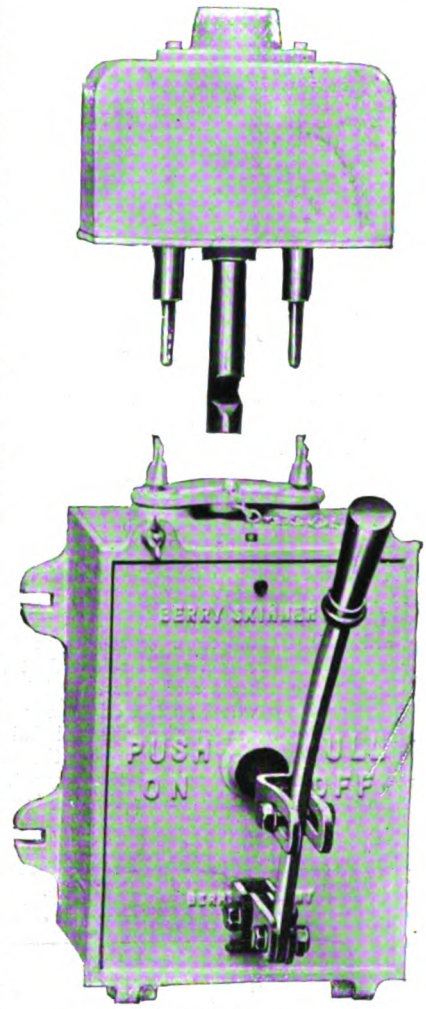
Newark-on-Trent. (Stand No. 158.)

Pumps.—The principal exhibit is a three-stage high-lift centrifugal pump, directly coupled through a flexible coupling to a Lancashire Dynamo Co. motor. The two machines are on a common bed-plate. The pump is designed to lift 600 gallons per hour against 300 ft. head, and it is shown running under actual working conditions. Its speed is 1,200 r.p.m. No special foundation has been provided, and yet the pump runs quite smoothly. The peculiarity of the design is that there are no guide vanes at all, these being rendered unnecessary by the construction of the casting. This reduction in parts is, of course, a great gain, especially for mining work, &c., and it also means economy in first cost. A small centrifugal two-stage pump for country houses, &c., is shown, coupled to a 1-h.p. motor, to lift 1,000 gallons per hour against 100 ft. head, and is intended for lifting water to a supply tank at the top of the house. The rest of the exhibits are Worthington standard low lift and medium lift pumps, and there is also a triplex single-acting pump.

Berry, Skinner & Co.,

78 Upper Thames Street, London, E.C. (Stand Nos. 188A & 216A.)

Switchgear.—Before describing this firm's exhibit, it is worthy of mention that every stand in the Exhibition is fitted with the firm's well-known pattern of push and pull fool-proof switch. In all some ten tons of this pattern of switchgear is in use in the Exhibition. Perhaps the most interesting novelty on the stand is the new patent combined switch, fuse, and detachable plug, which we illustrate below. This ingenious device conforms with the requirements of the mining regulations of the Home Office, and is especially suitable for use in mines. The plug can only be withdrawn when the switch is open, and cannot be inserted when the switch is closed. The apparatus is said to be flame-tight and water-tight. Other examples of the firm's standard switch and fuse boxes are shown. The chief feature of these push and pull switches is that both a rapid make and a rapid break are obtained, and that it is impossible to make circuit by merely closing the cover.



Combined Switch, Fuses and Detachable Plug.

Lamps and Meters.—Several examples of the new "Float" miners' and portable lamps are also shown. It will be remembered that these lamps are fitted with cells hermetically sealed, that there is no switch, and that to bring the elements into contact with the electrolyte, the cell is merely reversed. A repeater fuse-box (Denny's patent) is exhibited on this stand; this enables a circuit to be re-fused five times by merely turning a handle. The electrolytic prepayment meter manufactured by the Electrical Apparatus Co., Ltd., of Caxton House, Westminster, London, is also to be seen here. We described the working of this meter on page 140 of our issue of July 23rd last.

Ice-Making and Refrigerating Plant.—A complete ice-making plant, made by G. J. Worssom & Son, is shown working continuously. This is of the type in which liquid CO_2 is evaporated within a coil of piping surrounded by brine. The brine, which is cooled to several degrees below the freezing point of water, is used to make ice, and is also circulated by means of a small pump through pipes situated under the shelves of cold-storage rooms. The compressor for liquefying the CO_2, and the pump for circulating the brine, are driven by a small electric motor.

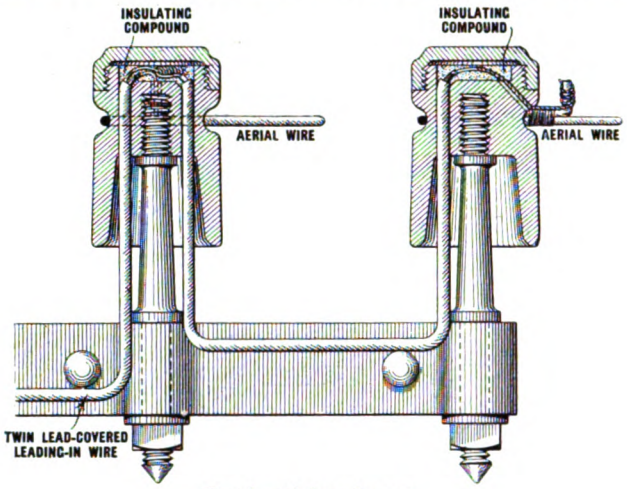
Taylor, Tunnicliffe, & Co., Ltd.,

Eastwood, Hanley, Staffs. (Stand No. 63.)

Insulators.—An interesting exhibit on this firm's stand is a combined pot-head and insulator for leading in telegraph wires. The lead-covered wire is brought up inside the first insulator, shown on the left of the illustration, through a hole in the top into a separate compartment, which is filled up solid with insulating material when the connection has been made. One of the wires of the pair is taken through the hole in the porcelain to the aerial wire, in the manner shown in the right-hand insulator, and the second wire is joined to another lead-covered cable, which goes up to the second insulator, and is led up in the same way. This firm also shows a specimen and drawing of the insulator used for the electrified section of the Midland Railway (Electrical Engineering, June 11th, 1908, p. 885), and a large collection of strong insulators for wireless

Digitized by Google

telegraphy, as well as a very large collection of porcelain holders for fuse carriers and many other purposes. Among them is one of the porcelain fuse holders used on the main



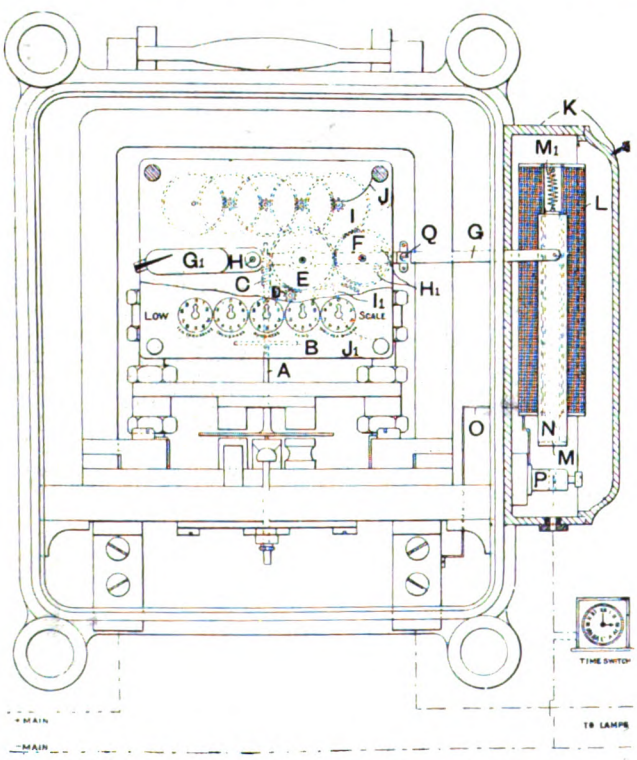
Pot-head Insulators.

distributing frames of some of the most recent Post Office exchanges; one of these was illustrated in our issue of November 14th, 1907.

Chamberlain & Hookham, Ltd.,

Solar Works, 4 New Bartholomew Street, Birmingham. (Stand Nos. 195 & 206.)

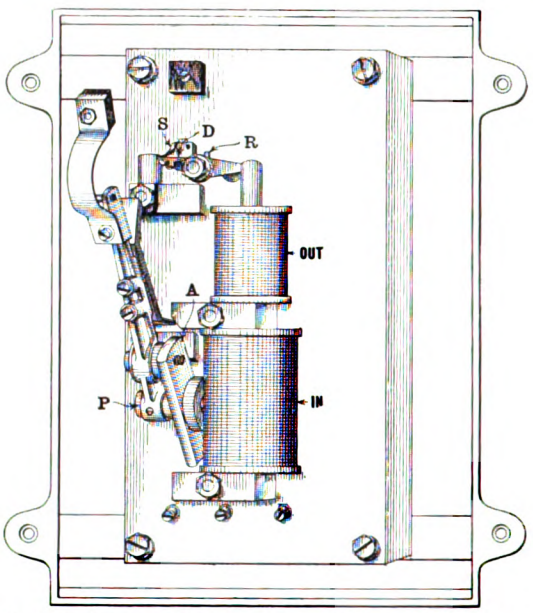
Meters and Time Switches.—Several types of meter are shown here for the first time. One of the most interesting of these is the Lackie demand meter, which is made as an attachment to an ordinary Chamberlain & Hookham meter at only a small extra cost. There is a small solenoid at the side of the meter, which lifts up a beam and puts the pinion carried by this beam into gear with a wheel on the one-hundredth unit spindle of the counter. The beam carries a small balance-weight, which is made to travel along the beam by the rotation of this pinion until it balances the pull of the magnet. The balance weight carries a pointer which marks the maximum demand in amperes



Chamberlain and Hookham Two-rate Meter.

on a scale beneath it. The most ingenious part of the device is an arrangement for giving the meter a time lag, so that the maximum currents are not recorded immediately. The usual lag is about 20 minutes, although this can be adjusted to any amount, and by this means short circuits, &c., do not prejudice the record of the maximum demand part of the meter. This is effected as follows:—Instead of the pinion gearing directly with the balance weight, it causes an endless thread to travel along the length of the beam, and on this thread is a small blob. It takes a certain time for this thread to travel round and for the blob to engage with the balance weight, and as soon as the beam balances, the thread is drawn back to its original position by a small hanging weight.

The firm's new electrolytic meter is exhibited, the action of which is as follows:—The electrolyte is shunted to a resistance in the main circuit, the drop of pressure in which at full load is 0·9 of a volt. The electrolyte of the meter is dilute sulphuric acid, which is sealed in a glass vessel together with two platinum electrodes coated with platinum black. The anode projects to some extent out of the electrolyte into an atmosphere of hydrogen, which is absorbed by the platinum black. When an electric current is passed through this vessel, the hydrogen absorbed by the anode combines with the oxygen which would otherwise be produced there, while an equal amount of hydrogen is deposited at the cathode. The deposited hydrogen rises into a vertical tube having a scale behind it, upon which its volume



Switch for working in conjunction with Venner Time-Switch.

is measured. This, of course, is proportional to the ampere-hours, and the scale is graduated to show Board of Trade units at the supply voltage. When the measuring tube has become nearly filled with hydrogen (corresponding to, say, 300 Board of Trade units), the meter reader tilts it forward, and the meter is thus again started at zero. A new "Midget" type of this meter is being placed on the market for from 1½ to 3 amperes. It is a very cheap form, and is intended for very small installations, and also for fixing at the back of radiators or other portable apparatus. On the stand is one of these small meters, through which several thousand times the normal current is passed to show that it will stand short-circuits without damage.

The Chamberlain & Hookham prepayment meter has been considerably modified, and the new design is exhibited. When a shilling is put in and the handle turned, a fairly heavy ball is raised and dropped into a beam with a V-shaped section. The weight of this ball overcomes the weight of a counterpoise and pulls the beam up, closing a switch and thus connecting up the circuit. At the same time a small star wheel which projects through a slit in the beam is put into gear with the counting train of the meter in its initial position. This wheel prevents the ball from rolling right to the end of the beam, but the wheel gradually rotates, corresponding to the shilling's-worth of energy registered by the meter, and when it has made a quarter revolution the ball passes it and drops over the end of the beam back into a trough beneath ready to be used again. Seven of these balls are provided with the meter, so that 7s. worth of electrical energy can be prepaid. The meter is also made for pennies instead of shillings.

A large proportion of Messrs. Chamberlain & Hookham meters are made with cyclometer counters instead of clock dials, and these counters can be adjusted to zero without difficulty.

A simple two-rate meter is shown connected to a Venner time-

Digitized by Google

switch. When the switch acts, a beam carrying an idle wheel is lifted or lowered, so that the meter spindle is connected up by this means to one or other of its counting trains. The arrangement is clearly seen in our illustration.

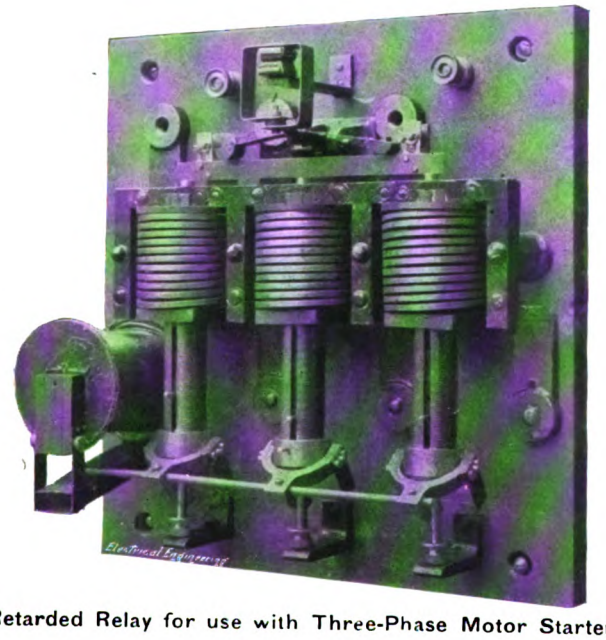
A modification of the Venner time-switch is also shown for use on arc-lighting circuits, when half the lamps have to be switched off at midnight, and the arrangement of the switch is such that a different half is switched off on alternate nights, so that all the lamps can be trimmed simultaneously. The figure opposite shows the construction of the latest type of main switch constructed to work with the Venner time-switch for similar purposes to this. The drawing represents a switch suitable for circuits from 30 to 150 amperes, and is approximately to scale. The two electromagnets "in" and "out" are connected to the circuits by the contact in the time-switch itself. When the electro-magnet marked "In" is excited, its armature *A*, which is pivoted at *P*, is rotated until it lies parallel with the axis of the bobbin. As the switch is also pivoted at *P*, this action, which is of course very rapid, throws the switch in, the latter being caught and held by detent *D*, which is controlled by spring *S*. When the "Out" solenoid is excited, the movement of its core, acting through the toggle piece pivoted at *R*, pulls up the detent and releases the switch, which is thrown out by the springs carrying the carbon contacts on which the final break is made. The switch is of the brush pattern, and is under compression when on, to ensure good contact. On the larger sizes an auxiliary copper sparking strip is fitted in addition to the carbon contact.

Credenda Conduits.—Specimens of Credenda conduit made by the Credenda Conduit Co. for house wiring are also exhibited at this stand. To show the extreme flexibility of the enamel, some half-inch conduit is shown rolled up into a coil with four turns of about 10 in. diameter, and the enamel is quite perfect and not cracked. Sharp elbows are now made of the actual tubing.

Eckstein, Heap & Co.

Salford, Manchester. (Stand No. 84.)

Switchgear.—A very substantial and effectively-arranged exhibit of continuous- and alternating-current switchgear is to be seen on this firm's stand. The chief feature of the large circuit breakers, which are of the loose handle type, is the large space allowed between the contacts when the switch is open. This



Retarded Relay for use with Three-Phase Motor Starters.

combined with the quick-break effect prevents the continuance of an arc, and a magnetic blow-out accelerates its extinction. The handle is connected to the arm by means of a toggle joint. The knuckle of the toggle joint is on its dead centre when the switch is closed. This is broken and the switch opened, when the pin of the knuckle is raised by the overload plunger. Several examples of the firm's pattern of knife switch, which has the larger half of the blade rigidly fixed to the handle, and a renewable quick-break contact piece, are exhibited. A number of large fuses, each of which consists of a number of 100 ampere unit fuses, are shown, and a representative collection of oil break switches is also to be seen. One of the most interesting items on the stand is the three-phase motor-starting switch unit, fitted with a patent retarded relay. The object of the retarded relay, an illustration of which we give, is to protect the motor at starting as well as under normal conditions. The three-series coils are put in the three phases of the stator respectively, and the plungers are set to operate at, say, 25 per cent. overload. These close a relay circuit and open the main switch in the usual manner. On the starting contacts the auxiliary magnet shown on the left is put in circuit. This rocks the lever and causes the springs to grip the buttons at the bases of the plungers. In order that the plungers may be lifted when gripped by these springs, a current of about five times the normal is required.

Aron Electricity Meter, Ltd.,

30A Salusbury Road, Kilburn, N.W. (Stand No. 131.)

Meters, Clocks, &c.—One of the chief items of this firm's exhibit is the 5,000-ampere portable meter, which has been designed and constructed to the requirements of the Manchester Corporation. As in the other patterns of portable meters, the pendulums are spring controlled, and the meter does not depend upon accurate fixing for accuracy of reading. Several examples of the firm's electrically-wound clocks are exhibited, and also their system of electrically-controlled clocks. In this system the master clock sends current impulses alternately in opposite directions. The controlled clocks have a mechanism which operates with a current in either direction, but two successive operations cannot be produced by current in the same direction. This prevents several successive movements of the minute hand due to an uncertain contact in the master clock. A self-contained double tariff meter, consisting of a single meter mechanism, two counting trains, and a clock switch, is exhibited. The clock switch changes over the counting mechanism at the beginning and the end of the high rate period. Meters are shown with an attachment for indicating the maximum demand. In order that this shall not indicate momentary demands, every few minutes a wheel is coupled to the meter mechanism for a definite time. This wheel moves round a certain angle which depends upon the average speed, and therefore the average demand during that period. The wheel carries round an index hand, which remains at the maximum position. Among the other novelties exhibited are prepayment meters for both alternating- and continuous-current circuits.

F. V. Brown & Co.,

3 Cross Street, Manchester. (Stand Nos. 34 & 35.)

T. H. & J. Daniels, Ltd., who are represented by the above firm in Manchester, exhibit a suction gas plant working with anthracite coke, and driving a 12 b.h.p. engine, to which is connected, by a belt drive, a dynamo for supplying light and power to the stand. This firm also exhibit a vertical three-throw belt-driven high-speed pump, capable of supplying 2,700 gallons of water per hour to a head of 150 ft. A horizontal sewage pump, also belt-driven, and with a capacity of 6,000 gallons per hour, is to be seen on the stand.

Sanders, Rehders & Co., Ltd., also represented by Messrs. F. V. Brown & Co., show a number of "Sarco" specialities, which include CO_2 recorders, and draught and pressure recorders. A new gas volume recorder for gas plants, for recording the actual volume of gas used by the engine, and suitable for use with hot and dusty gas, is also shown. Feed-water meters, steam meters, feed-water analysers, and calorimeters for fuel testing are also exhibited.

Arthur Ross, Hotchkiss & Co., Ltd.—The "Hotchkiss" automatic circulator for boilers is represented by a glass working model, which demonstrates the speed of circulation and the blowing out of oil, grease, and mud. Samples of mud and scale removed from boilers while at work by means of this circulator are also shown.

Cutler, Wardle & Co., Ltd., St. Peter's Square, Manchester. (Stand No. 265.)—The "Streetlite" lamp shown on this stand is a pleasing design of lantern for street lighting, intended particularly to take tantalum lamps. It consists of a heavy metal top, finished in black enamel, or alternatively oxidised, or in bright copper, and a round disc is fitted at the bottom of this covering the whole of the opening, immediately above the glass globe. A $\frac{3}{8}$-inch iron tube is screwed into the disc, and passes upwards through the top of the lantern, so that the disc takes the whole of the weight of the lamp. It also carries the holders in a vertical position, and acts as a reflector. The upper portion of the globe is opaque to a depth of three inches. This globe completely surrounds the lamp, but at the bottom there is a $1\frac{1}{2}$-inch hole, and four vents are made in the disc above referred to, corresponding to smaller vent holes in the metal top. This affords good ventilation through the lantern, and keeps it cool.

Digitized by Google

These lamps are also in some cases fitted with a vibration absorber, consisting of a helical spring arrangement at the bottom of the iron tube above referred to. Another interesting exhibit of this firm is a collection of metal-covered porcelain ceiling roses, &c., for which we understand a patent has been applied. The porcelain has a permanent coating of metal upon it, so that the fittings have the advantage of being metal-covered without the disadvantage of the metal covers being separate.

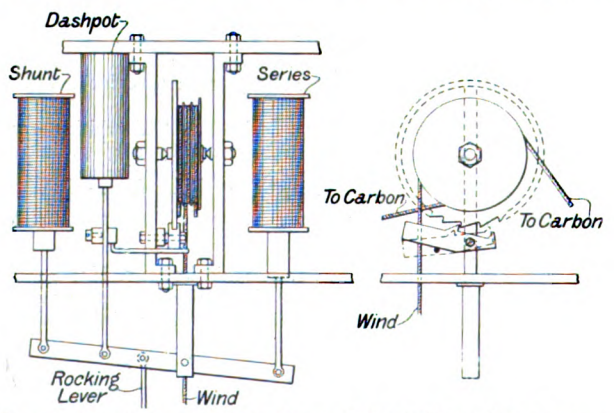
General Electric Co., Ltd., 71 Queen Victoria Street, London, E.C.—*Model Home Kitchen.*—A demonstration of the Archer system of electric cooking is being given in the kitchen attached to Messrs. Goodall's Model Home. The outfit consists of a 1,500 watt oven and auxiliary apparatus comprising saucepans, frying-pans, hot plates, kettles, &c. The oven can be heated up to a temperature hot enough for baking purposes in 20 minutes. The auxiliary utensils are connected to the oven by plugs and metal-covered flexible leads. Among the other electric kitchen fittings shown are electric irons, a boiler, a boot and silver polishing machine, and an electric knife cleaner.

Matthews & Yates, Ltd., Cyclone Works, Swinton, Manchester. (Stand No. 109.)—*Fans and Blowers.*—A large selection of electric fans for both alternating- and continuous-current are shown. The single-phase motors are of the induction type with a squirrel-cage rotor, and are provided with a special starting winding. Among the patterns of blowers exhibited is a new type especially designed for use with forges and cupolas, and similar cases where a small volume of air at a high pressure is required. A modified form of this type is used for exhausting gas in conjunction with gas-producing plants; in this form the inlet and outlet are fitted with drilled flanges to facilitate the attachment of gas pipes, and a gun-metal stuffing box is fixed to the side of the casing where the shaft passes through, so as to prevent the escape of gas. A fan of this type, directly coupled to an electric motor, is shown working on the stand. A complete pneumatic collecting plant is shown in operation. This consists of a system of piping, an electrically-driven blower, and a receiving box, and can be used for the transmission or removal of chips, shavings, dust, or grain.

Ebonestos Manufacturing Co., 127 Pomeroy Street, Old Kent Road, London, S.E. (Stand No. 197.)—A great variety of moulded "ebonestos" insulators, including switch handles, bushes, tube ends, and bases for switches, &c., are exhibited. Terminal connection pieces in which the terminals and nuts are moulded into position are also shown. These moulded parts are remarkably clean, and some fine specimens of moulded screw thread are to be seen.

John Swain & Son, Ltd., 58 Farringdon Street, London, E.C. (Stand No. 274.)—This firm's exhibit consists of a large number of photo-engravings and monochrome, two-colour, and three-colour process illustrations suitable for engineering catalogues.

The Abbey Electric Co., 17 Victoria Street, Westminster, London, S.W. (Stand No. 204.) *Flame Arc Lamps.*—Examples of the new "Abbey" flame arc lamps are exhibited. Five of these can be burnt on a 210-volt circuit, owing to the pressure across the arc having a maximum variation of only three volts.



Sketch illustrating the Working of the "Abbey" Arc Lamp.

This close regulation is obtained by a remarkably simple mechanism. The carbons are fed by gravity, and are hung by cords which pass over a drum to which is attached a large toothed wheel. As shown in the accompanying illustration, the double-toothed catch is so controlled by the shunt and series coils, that the wheel is allowed to slip one tooth at certain intervals. The rocking lever shown above is connected to the rocking carbon, and keeps the length of the arc constant. The base plate and economiser are cast in one piece of malleable iron. There is no magnetic field to control the arc.

James Howden & Co., Ltd., 105 Scotland Street, Glasgow. (Stand No. 69.)—*High Speed Engines.*—A triple expansion engine capable of developing 250 b.h.p. at 450 r.p.m. is exhibited. This engine has forced lubrication, and all the working parts are enclosed so as to prevent dirt or grit from entering the wearing surfaces. A small two-crank compound engine with cylinders side by side and a piston valve driven by a single eccentric in between is also shown. This engine develops 60 b.h.p. at a speed of 600 r.p.m.

Supplies, Ltd., Prescot, near Liverpool. (Stand No. 138.)—This firm shows a collection of radiators, each of which has a self-contained meter. In this way the radiator can be attached to any socket in the house, and the consumption charged at power rates, in cases where the supply authority agrees to accept the reading of such meters.

Premier Electric Lamp Co., Ltd.—Huyton Quarry, Near Liverpool. (Stand No. 224.) *Lamps.*—This firm exhibits 100-volt 43-watt metal filament lamps which, they inform us, have been made in England. The efficiency is 1·2 watts per British candle. The lamps are shown burning in every position.

The Howard Asphalt Troughing Co., Ltd.—Trafford Park, Manchester. (Stand No. 229.)—A number of sections of this firm's cable troughing, arranged so as to show the various stages in the work of laying mains on this system, are exhibited. These sections, made of natural rock asphalt, are supplied in lengths of 4 ft. They are welded by heating the ends and pressing them together. After the cables are laid in the troughing, bitumen is poured over them, and the trough is then filled with asphaltic concrete. The flexibility of the system is demonstrated by samples of troughing shown coiled in complete circles, and other samples passed under and over drain pipes.

Wm. Batty & Sons, Ltd.—7 & 9 Market Street, Manchester. (Stand No. 294.)—Examples of electrically-driven clocks (Perret's system) are shown. In this system the master clock is automatically wound every minute, and in the same action the current is distributed to the secondary clocks. An installation with the mechanism exposed is shown at the stand. Non-magnetic watches are also exhibited.

R. O'Brien & Co., 5 Bazennose Street, Manchester. (Stand No. 141.)—*Lamps, Dry Cells, &c.*—This firm are agents for the E.M.F. metal-filament lamp, of which they show several specimens displayed in various ways. One of the features of this lamp is a wire leading from the pip of the bulb to the bottom of the stem supporting the filaments, in order to increase the rigidity of the group of filaments and to prevent vibration. There are various sizes for voltages from 25 to 250, and the stated efficiency is one watt per candle at low voltages, and 1¼ at high voltages. Another exhibit is a dry cell made under Scek's patent, which has a very low internal resistance. The makers claim that when partially exhausted it can be repolarised by charging it with one-fifth of an ampere from the lighting mains through a lamp for one or two hours. Several small motor-driven devices are shown, including a revolving platform for shop windows or show cases, a label-pasting machine, and an electric sign.

J. & H. Grevener, Eldon Street House, London, E.C. (Stand No. 210.)—*Arc Lamps.*—Several examples of the "Arcoflame" flame arc lamps for both continuous- and alternating-current circuits are exhibited. The smallest of these is a 4½ amp. continuous lamp, which can be obtained for 10 or 16 hours' burning life. Some small enclosed arc lamps taking 3, 4, and 5 amps., and burning 25 hours on one trimming, are also shown. Other lamps with 65 and 180 hours' burning life are shown. The single burning lamps are series wound, but those for series lighting are of the differential type. A large number of accessories are shown, including a new pattern of automatic coupling, which has only recently been developed. This always finds the contacts, as by a cam arrangement the contacts are turned round to the right position as the two portions of the coupling approach one another. The mechanism is very simple, and the release certain.

The Gilbert Arc Lamp Co., Ltd.—Chingford, Essex.

The Electric Control, Ltd.—Glasgow.

The Premier Electric Control, Ltd.—Red Lion Street, Clerkenwell, London.

These three firms are exhibiting at Stand Nos. 135 and 159, with Messrs. Parmiter, Hope & Sugden, their agents for Lancashire and Yorkshire. By an oversight their exhibits were described in our last issue under the heading of Parmiter, Hope & Sugden, instead of each firm having a separate heading.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 22nd, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in brackets indicate communicators of inventions from abroad.

1907 Patents

17,532, **Surface-contact Traction System.** E. A. Mitchell. In this system the pivoted switch arm is attached to an iron armature immediately under the head of the stud. This is drawn up by a magnetic skate so arranged that the flux passes in through one section of the stud and out through another. The switch opens by gravity alone, and when in the off position the arm rests against an earthed contact and earths the stud. The switch-box is filled with an oil of greater density than water, and the stud head, with all the switch parts attached thereto, can be withdrawn easily for inspection. In order to facilitate this, the connections to the live cable and the earthing conductor are made through mercury cups. Nine claims, two figures.

22,203, **Lift Control.** British Thomson-Houston Co. (*Allgemeine Elektricitats-Ges.*). In lift installations employing series- or compound-wound motors, the connections are so arranged that in the downward power positions of the controller a starting resistance and the main are connected in series to the line, and one terminal of the armature is connected to the line and field, while the other terminal is connected to varying points of the starting resistance through which the live current flows for the purpose of limiting the downward speed of the lift at starting. One claim, four figures.

24,027, **Arc Lamp.** D. Timar and K. von Dreger. This arc lamp has parallel downward pointing carbons, separated by rollers of insulating material placed sufficiently close together to allow only the conical tip of the carbons to project, so that feeding is by gravity alone. The patent does not cover any method of striking the arc. Two claims, one figure.

27,224, **Electrolytic Lightning Arrester.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). This relates to the construction of electrolytic condensers, consisting of a plurality of nested dishes with a suitable electrolyte in between them. Instead of single aluminium dishes exposed to the electrolyte on both sides, double aluminium cones are employed separated by an impenetrable insulating layer, but connected at the edges. This is in order to avoid the short-circuiting effect of the small holes which sometimes appear in the plate, due to local action. Three claims, one figure.

1908 Patents

461, **Lamp Filament Supports.** C. H. Stearn and C. F. Topham. In order to prevent a tendency for the filaments to twist laterally from the position in which they are mounted whilst allowing them to move freely in a longitudinal direction under the influence of heating and cooling, the support is made in the form of a spring flattened in a plane transverse to the length of the filament, and provided with a flat hook or loop to engage the filament. Two claims, two figures.

12,352, **Radiators.** C. N. Nobbs, C. G. Nobbs, and J. E. Rosenthal. In the radiators described in this specification, the resistance consists of bare wire interwoven with strips of asbestos or other material, and immersed in oil contained in the closed metallic body of the radiator. The wire is so arranged that parts between which there is great potential difference are kept well apart. The leading-in wires are brought through insulating bushes above the level of the oil. Five claims, two figures.

18,331, **Regenerative Braking for Single-phase Motors.** W. Cooper. In this control system, single-phase commutator motors are arranged for regenerative braking by connecting them, so that one machine acts as exciter to the other, while the armature of the second machine is connected to the main auto-transformer. The field of the exciting machine is also fed from the autotransformer. Means are provided for adjusting the phase of the regenerated current to agree with that of the E.M.F. of the supply current. Two claims, six figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

5,560, Stewart. Working of rail points, plough guides, and cable grip guides.

17,719, Chitty, Lange, & Mascord. Distribution of electromotive power.

19,612, Fett. Central alarm and telephone apparatus.

19,882, British Thomson-Houston Co. & Clough. Dynamo-electric machines.

21,861, Rosenbaum. Switchboard cable connector.

22,036, Lake (*Michaud & Delasson*). Filaments for illuminating and heating purposes.

22,311, Cowper-Coles. Electro-deposition of iron.

22,312, Cowper-Coles. Manufacture of iron articles by electro-deposition.

22,478, Martin. Composition applicable for use for the purpose of damping, transmitting, or reproducing mechanical vibrations, and, if desired, translating them into electrical variations.

22,543, Cowper-Coles. Anodes for electro-deposition.

22,871, Allgemeine Elektricitäts-Ges. Track switch and signalling systems.

24,307, Von Eltenberg & Lach. Galvanic cells having rotating electrodes.

25,305, Scherbius. Regulation of induction motors.

25,511, Banks. Electric portable photographic lamps.

25,831, Harter. Electric lamp cluster-sockets.

25,902, Phœnix Dynamo Manufacturing Co. & Pohl. Cooling of dynamo-electric machines.

25,998, Aarhus Dynamo & Electro-Motorfabrik, & Johansen. Electrically-operated winches.

26,470, Ogg. Steam Turbines.

27,131, British Thomson-Houston Co. & Wedmore. Electric distribution systems.

27,596, Mather & Platt, Ltd., Coubrough, & Frith. Dynamo-electric machines.

28,143, Midgley. Generation, control, and transmission of electric energy for automobiles.

28,281, Thomson. Collapsible trolley pole.

28,436, Gardiner. Electric signalling on railways.

1908 Patents

1,709, British Thomson-Houston Co. (*Noeggerath*). Collecting-rings for dynamo-electric machines.

1,832, Siemens Bros. Dynamo Works, Ltd., & Schenkel. Dynamo-electric machines.

2,303, Siemens Bros. Dynamo Works, Ltd., & Lydall. Single-phase commutator motors.

3,464, Andersson. Electric arc lamp.

3,492, Mahl. Variable rate meters.

3,894, Burgess. Electric railway signalling system.

4,472, Schneidau. Electric wall plugs.

4,635. Ayles. Electrically-operated horns and trumpets.

4,760, Lake (*Elektrische Gluhlampenfabrik, Watt, Scharf, Loti, & Latzko*). A conducting connection for incandescent lamps.

4,948, Howard. Alternating-current relay devices.

5,318, Swan. Incandescent lamp sockets.

5,402, Harkness. Trolleys or collectors for electricity.

5,560, Stearn & Topham. Incandescence electric lamps.

5,972, Wigh. Electric lighting for bicycles and motor-cars.

6,245, Westinghouse Metal Filament Lamp Co. Metal filament lamps.

8,206, Elektricitäts-Ges. Alioth. Electrical devices for the measurement of speeds.

8,287, Felten & Guilleaume-Lahmeyerwerke Akt.-Ges. Transporting apparatus.

8,887, Lutz. Apparatus for disinfecting telephones.

9,288, Aron. Electricity meters for use in connection with storage batteries.

9,638, Siemens-Schuckertwerke-Ges. Three-phase commutator dynamo-electric machines.

11,814, Varela. Electro-automatic sounding apparatus.

12,556, Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke-Ges.*) Metal-coated carbons for searchlights.

13,527, Firm Robert-Bosch. Ignition apparatus.

14,188, Kearney. Grooved wheels for mono-railway and tramway systems.

14,340, Aron, Induction meters for polyphase currents.

15,910, Konig. Adjustable iron insulator support.

16,852, Hall. Sparking-plugs.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

10,891, Wolfram-Lampen Akt.-Ges. Filaments for electric incandescent lamps.

12,325, Woodbridge. Electrical distribution.

19,847, Gluhlampenwerk Anker-Ges. Prevention of disintegration of incandescent filaments.

ELECTROMETALLURGY AND ELECTROCHEMISTRY

E. BECK, in *Metallurgie*, 5, 504, describes alloys of magnesium which he employs to fix atmospheric nitrogen. It is well known that magnesium readily reacts with nitrogen to form a nitride. The author finds that certain alloys of magnesium can be more readily prepared than metallic magnesium itself. A suitable method to obtain an alloy of tin and magnesium is to dissolve magnesium oxide in molten carnallite, and then to electrolyse this with an anode of carbon and a molten tin cathode. When the electrolysis is finished, a current of nitrogen is blown through the molten bath through an iron pipe covered with fireclay. The magnesium dissolved in the tin is converted into nitride, the tin being unacted upon. The nitride is then treated with steam, when ammonia is produced and magnesium oxide formed; this oxide can be dissolved in molten carnallite, and used again. It is calculated that the cost of fixing atmospheric nitrogen and producing ammonia in this way is rather cheaper than the method of Frank and Caro (cyanamide process).

In the German Patent 201,665 M. Baum describes a method for coating metals with platinum. It is found that it is easy to obtain a firm deposit of platinum by, in the first place, coating the metal which it is desired to protect with nickel or cobalt. First of all, the nickel is plated upon the article, then a coating of platinum deposited, and after this the whole is heated in an atmosphere of a reducing gas, such as hydrogen. A further deposit of platinum is then plated on, and the heating process repeated. The deposition of platinum and the heating is continued until a deposit of the required thickness is obtained. Obviously copper wire, if it is first coated with nickel, can also be coated with platinum, and it is stated the wire can be bent about into all sorts of angles without the platinum springing off. Copper itself alloys with platinum at about 350°.

In *Electrochemical and Metallurgical Industry* of October some improvements in the Girod steel furnace are noted. In the arc furnace of Dr. Héroult two carbon electrodes were used upon the slag covering the steel bath. The arcs strike between the ends of the carbons and the slag, the two arcs being in series and the two carbons of opposite polarity. The current passes from one carbon into the slag and metal bath, and finally out through the other electrode. The new Girod furnace is not unlike the Héroult in external appearance, but the electrodes at the top of the baths are all of the same polarity, while the other pole is provided in the bottom of the furnace. Thus the current passes from the electrodes through the slag and into the steel bath, finally leaving through the bottom. The slag and the steel bath are thus two resistances in series, and consequently the furnace is a combined electrode and resistance furnace. With this arrangement automatic regulation is easier than with two arcs in series. The pressure is reduced to about one-half of that required with two arcs, 50 volts being found sufficient to operate one Girod furnace. The furnace is made of a sheet steel framework, which has a circular or rectangular section, and is lined with magnesia. The steel is tapped by tilting the furnace. The electrodes pass through the roof of the furnace, which is made from silicon brick surrounded by cast-iron pieces cooled by water circulation, and they are adjusted in such a manner that air cannot enter the furnace. Such an adjustment is made possible owing to the electrodes being of the same polarity; there is consequently no danger of short-circuiting. The electrodes are regulated automatically either by voltage or current regulation. If the furnace is small one top electrode only is used and voltage regulation only is employed. If it is large and energy is employed from a transformer, or if there are several electrodes in parallel, then current regulation is employed. The consumption of power per ton of steel produced is about 1,000 kw. hours. The cost of the electrodes is about 3s. 4d. For refining a liquid charge the total cost is about 1s. 8d. per ton of steel. To work the furnace a smelter, an assistant, and a boy are required.

REPORT OF THE INTERNATIONAL CONFERENCE ON ELECTRICAL UNITS AND STANDARDS

THE following is an abstract of the report of the International Conference on Electrical Units and Standards, which concluded its meeting on Wednesday, October 21st:—

The Conference on Electrical Units and Standards, for which invitations were issued by the British Government, was opened by the President of the Board of Trade, the Right Hon. Winston S. Churchill, M.P., on Monday, October 12th, 1908, at Burlington House, London, S.W. Delegates were present from twenty-one countries, and also from Australia, Canada, India, and the Crown Colonies. The Conference elected a Technical Committee to draft specifications and to consider any matter which might be referred to the Committee and to report to the Conference.

As a result of its deliberation, the Conference adopted the resolutions and specifications attached to this report, and set out in Schedule B, and requested the delegates to lay them before their respective Governments with a view to obtaining uniformity in the legislation with regard to electrical units and standards. The Conference recommend the use of the Weston normal cell as a convenient method of measuring both electromotive force and current when set up under the conditions specified in Schedule C.

In cases in which it is not desired to set up the standards provided in the resolutions, Schedule B, the Conference recommends the following as working methods for the realisation of the international ohm, the ampere, and the volt:—

1. *For the International Ohm.*—The use of copies, constructed of suitable material and of suitable form and verified from time to time of the international ohm, its multiples, and submultiples.

2. *For the International Ampere.*—(*a*) The measurement of current by the aid of a current balance standardised by comparison with a silver voltameter; or (*b*) the use of a Weston normal cell, whose electromotive force has been determined in terms of the international ohm and international ampere, and of a resistance of known value in international ohms.

3. *For the International Volt.*—(*a*) A comparison with the difference of electrical potential between the ends of a coil of resistance of known value in international ohms, when carrying a current of known value in international amperes; or (*b*) the use of a Weston normal cell whose electromotive force has been determined in terms of the international ohm and the international ampere.

The duties of specifying more particularly the conditions under which these methods are to be applied has been assigned to the Permanent Commission, and, pending its appointment, to the Scientific Committee to be nominated by the president. The Conference has considered the methods that should be recommended to the Governments for securing uniform administration in relation to electrical units and standards, and expresses the opinion that the best method of securing uniformity for the future would be by the establishment of an international electrical laboratory with the duties of keeping and maintaining international electrical standards. This laboratory to be equipped entirely independently of any national laboratory. The Conference further recommends that action be taken in accordance with the scheme set out in Schedule D.

SCHEDULE B.—(*Resolutions.*)

I. The Conference agrees that as heretofore the magnitudes of the fundamental electric units shall be determined on the electromagnetic system of measurement with reference to the centimetre as the unit of length, the gramme as the unit of mass, and the second as the unit of time. These fundamental units are (1) the ohm, the unit of electric resistance which has the value of 1,000,000,000 in terms of the centimetre and second; (2) the ampere, the unit of electric current which has the value of one-tenth (0·1) in terms of the centimetre, gramme, and second; (3) the volt, the unit of electromotive force which has the value 100,000,000 in terms of the centimetre, the gramme, and the second; (4) the watt, the unit of power which has the value 10,000,000 in terms of the centimetre, the gramme, and the second.

II. As a system of units representing the above and sufficiently near to them to be adopted for the purpose of electrical measurements and as a basis for legislation, the Conference recommends the adoption of the international ohm, the international ampere, and the international volt defined according to the following definitions.

III. The ohm is the first primary unit.

IV. The international ohm is defined as the resistance of a specified column of mercury.

V. The international ohm is the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice, 14·4521 grammes in mass, of a constant cross sectional area, and of a length of 106·300 centimetres. To determine the resistance of a column of mercury in terms of the international ohm, the procedure to be followed shall be that set out in Specification I. attached to these resolutions.

VI. The ampere is the second primary unit.

VII. The international ampere is the unvarying electric cu

Digitized by Google

rent which, when passed through a solution of nitrate of silver in water, in accordance with the Specification II. attached to these resolutions, deposits silver at the rate of 0·00111800 of a gramme per second.

VIII. The international volt is the electrical pressure which, when steadily applied to a conductor whose resistance is one international ohm, will produce a current of one international ampere.

IX. The international watt is the energy expended per second by an unvarying electric current of one international ampere under an electric pressure of one international volt.

SPECIFICATION I.—(*Specification Relating to Mercury Standards of Resistance.*)

The glass tubes used for mercury standards of resistance must be made of a glass such that the dimensions may remain as constant as possible. The tubes must be well annealed and straight. The bore must be as nearly as possible uniform and circular, and the area of cross-section of the bore must be approximately one square millimetre. The mercury must have a resistance of approximately one ohm. Each of the tubes must be accurately calibrated. The correction to be applied to allow for the area of the cross-section of the bore not being exactly the same at all parts of the tube must not exceed five parts in 10,000. The mercury filling the tube must be considered as bounded by plane surfaces placed in contact with the ends of the tube. The length of the axis of the tube, the mass of mercury the tube contains, and the electrical resistance of the mercury are to be determined at a temperature as near to 0° C. as possible. The measurements are to be corrected to 0° C. For the purpose of the electrical measurements, end vessels carrying connections for the current and potential terminals are to be fitted on to the tube. These end vessels are to be spherical in shape (of a diameter of approximately four centimetres) and should have cylindrical pieces attached to make connections with the tubes. The outside edge of each end of the tube is to be coincident with the inner surface of the corresponding spherical end vessel. The leads which make contact with the mercury are to be of thin platinum wire fused into glass. The point of entry of the current lead and the end of the tube are to be at opposite ends of a diameter of the bulb; the potential lead is to be midway between these two points. All the leads must be so thin that no error in the resistance is introduced through conduction of heat to the mercury. The filling of the tube with mercury for the purpose of the resistance measurements must be carried out under the same conditions as the filling for the determination of the mass. The resistance which has to be added to the resistance of the tube to allow for the effect of the end vessels is to be calculated by the formula.

$$A = \frac{0{\cdot}80}{1063\pi}\left(\frac{1}{r_1}+\frac{1}{r_2}\right)\text{ohm},$$

where r_1 and r_2 are the radii in millimetres of the end sections of the bore of the tube. The mean of the calculated resistances of at least five tubes shall be taken to determine the value of the unit of resistance. For the purpose of the comparison of resistances with a mercury tube the measurements shall be made with at least three separate fillings of the tube.

SPECIFICATION II.—(*Specification Relating to the Deposition of Silver.*)

The electrolyte shall consist of a solution of from 15 to 20 parts by weight of silver nitrate in 100 parts of distilled water. The solution must only be used once, and only for so long that not more than 30 per cent. of the silver in the solution is deposited. The anode shall be of silver, and the kathode of platinum. The current density at the anode shall not exceed 1/5 ampere per square centimetre and at the kathode 1/50 ampere per square centimetre. Not less than 100 cubic centimetres of electrolyte shall be used in a voltameter. Care must be taken that no particles which may become mechanically detached from the anode shall reach the kathode. Before weighing, any traces of solution adhering to the kathode must be removed, and the kathode dried.

SCHEDULE C.—(*Weston Normal Cell.*)

The Weston normal cell may be conveniently employed as a standard of electric pressure for the measurement both of E.M.F. and of current, and when set up in accordance with the following specification, may be taken, provisionally, as having, at a temperature of 20° C., an E.M.F. of 1·0184 volts.

Specification Relating to the Weston Normal Cell.—The Weston normal cell is a voltaic cell which has a saturated aqueous solution of cadmium sulphate ($CdSO_4 8/3H_2O$) as its electrolyte. The electrolyte must be neutral to Congo red. The positive electrode of the cell is mercury. The negative electrode of the cell is cadmium amalgam consisting of 12·5 parts by weight of cadmium in 100 parts of amalgam. The depolariser, which is placed in contact with the positive electrode, is a paste made by mixing mercurous sulphate with powdered crystals of cadmium sulphate and a saturated aqueous solution of cadmium sulphate. The different methods of preparing the mercurous sulphate paste will be described in notes. One of the methods there specified must be carried out. For setting up the cell, the // form is the most suitable. The leads passing through the glass to the electrodes must be of platinum wire, which must not be allowed to come into contact with the electrolyte. The amalgam is placed in one limb, the mercury in the other. The depolariser is placed above the mercury and a layer of cadmium sulphate crystals is introduced into each limb. The entire cell is filled with a saturated solution of cadmium sulphate and then hermetically sealed. The following formula is recommended for the E.M.F. of the cell in terms of the temperature between the limits 0° C. and 40° C.

$$E_t = E_{20} - 0{\cdot}0000406\,(t-20°) - 0{\cdot}00000095\,(t-20°)^2 + 0{\cdot}00000001\,(t-20)^3$$

SCHEDULE D.—(*Proposed Establishment of a Permanent Commission.*)

1. The Conference recommends that the various Governments interested establish a permanent International Commission for Electrical Standards.

2. Pending the appointment of the Permanent International Commission the Conference recommends that the President, Lord Rayleigh, nominate for appointment by the Conference a scientific committee of fifteen to advise as to the organisation of the Permanent Commission, to formulate a plan for and to direct such work as may be necessary in connection with the maintenance of standards, fixing of values, inter-comparison of standards, and to complete the work of the Conference. Vacancies on the committee to be filled by co-optation.*

3. That laboratories equipped with facilities for precise electrical measurements and investigations should be asked to co-operate with this committee and to carry out, if possible, such work as it may desire.

4. The committee should take the proper steps forthwith for establishing the Permanent Commission, and are empowered to arrange for the meeting of the next Conference on Electrical Units and Standards, and the time and place of such meeting should this action appear to them to be desirable.

5. The committee or the Permanent International Commission shall consider the question of enlarging the functions of the International Conference on Weights and Measures, with a view to determining if it is possible or desirable to combine future Conferences on Electrical Units and Standards with the International Conference on Weights and Measures, in place of holding in the future Conferences on Electrical Units and Standards. At the same time it is the opinion of the Conference that the Permanent Commission should be retained as a distinct body, which should meet at different places in succession.

INJURY BY TRAWLERS TO SUBMARINE CABLES

THE Interdepartmental Committee who have been considering the alleged injuries caused to submarine cables by the operations of trawlers has now issued its report. The committee consisted of Sir J. C. Lamb, C.B., C.M.G., formerly Second Secretary to the Post Office (chairman); Mr. W. R. Culley, I.S.O., Submarine Superintendent in the Engineering Department of the Post Office; Commander G. C. Frederick, R.N., Professional Member of the Harbour Department of the Board of Trade; Mr. C. E. Fryer, I.S.O., Superintending Inspector of English Fisheries; Mr. W. S. Green, C.B., Chief Inspector of Irish Fisheries; and Commander G. M. Marston, R.N., of the Hydrographic Department of the Admiralty.

The committee examined a number of witnesses and fully investigated the construction of trawling gear, and numerous photographs of typical trawls of the "otter board" and older "beam" type are included in the report. A summary of the conclusions is given below:—

The committee are of opinion that injury is sometimes caused to submarine cables by otter boards of certain types and boards out of repair, and by beam trawls with defective trawl-heads. They think that there would be little risk of injury from trawls of either kind if they were always suitably constructed and in good condition. They find that the owners of trawling vessels are generally willing, and indeed anxious, to modify their trawling gear with the view of minimising the risk. They are not prepared to recommend the proscription of any area beyond territorial limits. They recommend that all cable companies should (as certain companies and the Post Office have already done) establish friendly relations with the fishermen who frequent the waters in which their cables are laid; while the fishermen on their part should try to clear their trawls when they foul a cable, and should report the position of any contact with a cable. They recommend that a system of Government inspection of the gear of trawlers be at once instituted. They recommend that steps be taken through the diplomatic channel to invite neighbouring foreign States to adopt a similar system of inspection. They think that eventually an International Conference may be necessary to settle the terms of a Convention on the subject. They recommend that the cable companies should consider the question of substituting heavier types of cable in the areas affected.

* In accordance with § 2, Lord Rayleigh has nominated the following Committee, which has been approved by the Conference, viz.: Dr. Osuke Asano, M. R. Benoit, Dr. M. N. Egeroff, Prof. Erie Gérard, Dr. R. T. Glazebrook, Dr. H. Haga, D. L. Kusminsky, Prof. G. Lippmann, Prof. A. Roiti, Dr. E. B. Rosa, Dr. S. W. Stratton, Mr. A. P. Trotter, Prof. E. Warburg, Prof. Fr. Weber.

SUMMARY

WE are able to publish some extracts from a translation of the speech which Mons. P. BOUCHEROT made at the dinner of the Institution of Electrical Engineers in reply to the toast of the International Electrotechnical Commission. (Page 602.)

A LARGE number of manufacturers of machine tools were represented at the Electrical Exhibition in Manchester, and we give in this issue an article describing the more important of the machines exhibited. Some of the large machines were fitted with self-contained motor drive, and a variety of patterns of small portable electric drills and grinders were shown. Several large planers and drilling machines were exhibited, and a number of lathes, grinders, gear-cutting, and slotting machines were to be seen. Application of electrical working, other than electric driving, were also represented by some examples of magnetic chucks and drill posts. (Page 603.)

THE following books are reviewed in this issue:—"Cranes," by A. Böttcher; "Power Railway Signalling," by H. Rayner Wilson; "Laboratory and Factory Tests in Electrical Engineering," by George Sever and Fitzhugh Townsend. (Page 608.)

AN article by Mr. G. M. B. SHEPHERD describes the various uses to which condensers are put in modern telephony, both in association with the subscribers' telephone stations and in the exchange. (Page 609.)

THE Paper read by Capt. A. GARDINER before the Leeds Local Section of the Institution of Electrical Engineers on Wednesday of last week described a new proposed system of cab-signalling for railways designed to supersede entirely the usual semaphore and lamp. A working model of the apparatus was shown, and a lengthy discussion followed, in which a number of well-known railway men took part. (Page 612.)

IN a Paper read before the American Institute of Electrical Engineers at their annual summer meeting this year, three examples of a type of construction for power stations, as yet unrepresented in England, were described. The main feature of this new type is that the station is built with two floors. On the ground floor the boiler plant is situated, and the turbo-generator sets are on the floor above. With this mode of construction a very low figure for the floor space per kilowatt is obtained, and the arrangement of the steam piping is particularly easy. A special form of steel girder construction is necessary to take the weight of the generating plant, but no troubles have been experienced from vibration. A useful table, giving the approximate floor space required for different types of prime-movers, is included in the Paper. (Page 611.)

Digitized by Google

In an appendix (which we reproduce) to a Paper on high-speed tool steel, recently read in America, curves are given which show the motor horse-power required by lathes, boring mills, planers, forging and bolt-heading machines, and fans of various capacities. Formulæ, for estimating the horse-power of the motor required in special cases, are also stated, and many examples of actual cases are included. These latter show the necessity for taking account not only of the normal capacity of the machine tool itself, but also of the work that it will be set to do. For instance, a type of lathe usually furnished with a 20 h.p. motor is mentioned. For average shop work a 10 h.p. motor would have been ample, but this same machine required in one case a 60 h.p. motor. (Page 615.)

On Tuesday the case for the promoters of the London and District Electricity Supply Bill was completed before Mr. Luke White's Committee of the House of Commons. In a report upon the Bill the Board of Trade recommend the reconsideration on the part of the Committee of several clauses, notably the purchase clause and the clause relating to the acquisition of existing undertakings by the Company. In the House of Commons on Monday, the London Electric Supply Bill and the London (Westminster and Kensington) Electric Supply Bill were read a second time after a short discussion, during which an instruction to the Committee dealing with the Bills was passed authorising the insertion of the name of the London County Council as the purchasing authority. (Page 617.)

The Highways Committee of the London County Council recommend that an application should be made for Parliamentary powers to use the trackless trolley system in the Blackwall and Rotherhithe tunnels for connecting up the northern and southern tramways systems. The Council, however, has postponed the matter pending further details of the system. (Page 619.)

A Consular report for the year 1906-7 gives details of a number of power transmission works in Italy. (Page 620.)

A motor-operated automatic battery regulating switch is described. This is controlled by a voltmeter relay, which causes the motor to be switched on and the number of cells in the circuit increased or decreased according as to whether the supply voltage has decreased or increased. The switch is worked by the motor by means of a rocking frame, which is given an oscillatory motion from a crank worked by the motor through worm gearing. (Page 620.)

We describe a system of electric lift control, known as the "Keighley" system. For control from the cage the cage switch controls a pair of solenoids acting in opposite directions on a plunger which is furnished with a rack. The rack gears into a pinion on the spindle of the main controller. An interpole motor and a compound-wound magnetic brake are employed. (Page 621.)

A new protected wall socket is described. (Page 621.)

Among the specifications published by the Patent Office on Thursday last is one by W. J. Stewart for an apparatus for enabling the rail points and plough guides of a conduit tramway system to be worked from a passing car. The British Thomson-Houston Co. and F. H. Clough have one for a special construction of the rotor field systems of turbo-generators; and a method of artificially cooling commutators by jets of air is protected by the Phœnix Dynamo Manufacturing Co. and R. Pohl. An alternator winding for avoiding large section conductors is described in a specification by Mather & Platt. The Westinghouse Metal Filament Lamp Co. has a specification for a means of suspending metal filaments, and Siemens Bros. Dynamo Works, Ltd., have protected a means of preventing the small section negative carbons used in searchlights from being consumed too rapidly. Among the expiring patents is one by La Société Anonyme pour la Transmission de la Force par l'Electricité for an asynchronous self-exciting alternator. Short abstracts of all the above specifications are given in our Patent Record. (Page 623.)

It is stated that the Premier of Victoria has recommended that the first portion of the Melbourne suburban railway system shall be converted to electric traction in accordance with Mr. C. H. Merz's report. —The accounts of the Kingston Corporation electricity undertaking for the past year show a deficit of £884, compared with a deficit of £7 for the previous year.—Street-lighting experiments with arc lamps and gas are being carried out at Leeds.—In connection with the recent criticisms concerning his report upon the Westinghouse turbines in the Lister Drive power station at Liverpool, Mr. Bromley Holmes, the consulting engineer to the Corporation, threatens legal proceedings.—The London County Council has asked the Prime Minister to receive a deputation on the question of London traffic.—The General Electric Co. has guaranteed an average life of 1,100 hours for Osram lamps which have been ordered by the Fulham Council.—It is announced that the report of Mr. W. M. Mordey upon the G.B. Surface Contact system in the Mile End Road will be placed before the next meeting of the London County Council.—A scheme of tramways is to be promoted next session connecting up several towns in the Manchester district.—The Newcastle tramways accounts show a balance of £19,477 after meeting capital charges.—Arrangements have been made between the Poplar and Stepney Borough Councils for a stand-by supply. (Pages 625-626.)

An electric lighting plant is required at the Essex County Lunatic Asylum; 800 yards of three-core cable is required by the Middleton Corporation; electrical stores by the Bradford Committee, the Dublin United Tramways Committee, and the London General Omnibus Co.; and a common battery switchboard, &c., by the Tasmanian Government. The Local Government Board has sanctioned a loan of £1,000 to the Leyton Council, and it is stated that a loan of $100,000 has been granted to the Penang Municipality for electrical purposes. An important tender in connection with the Adelaide tramways system has been placed with the Australian agents of the A.E.G. Berlin. It is announced that the whole of the first batch of tenders for the supply of wireless telegraph apparatus to the Australian Government have been rejected as not complying with the specification. (Pages 626-628.)

At the annual meeting of the Edison and Swan United Electric Light Co., last week, it was stated that the company's metal filament lamp factory is now turning out lamps of this class in larger quantities than any other factory in the country, and that this is being done without any patents having been acquired.—The accounts of the Norwich Electric Tramways Co. for the year to June 30th show a net profit of £3,830.—At the annual meeting of the Douglas Southern Electric Tramways Co., on Thursday, the report, which recommends a dividend of 5 per cent. upon the preference shares, was adopted. The total balance available was £1,658.—In a report issued by the X Accumulator Co., it is stated that the working capital originally subscribed was insufficient for the company's purposes, and that necessary steps are being taken to wind the company up. (Pages 628-629.)

Although the exhibits at Manchester were of course mainly the products of the manufacturing electrical engineer, there were many sections of the exhibition which related to the apparatus required by the manufacturer for the execution of his work. Prominent among these were machine tools, which, as indicated by a special article in this issue, were thoroughly repre-

Digitized by Google

sentative of the latest work of some of the leading machine-tool makers in this country, and incidentally demonstrated many points in connection with electrical driving. In the earlier days, when electric driving was the exception rather than the rule, it was only natural that standard arrangements of gearing, shafting, &c., were employed, and standard constant-speed motors set to drive them. At the present time, however, the tendency is showing itself more and more widely to treat the motor and the machine tool as parts of one structure, and to design the one to meet the other. In some cases the motor is even built into the frame of the machine, or in other ways forms an integral part of it, so that belting is entirely avoided. The same idea is sometimes carried further, and the controller is also embodied in the machine itself. Another growing tendency—although with some exceptions perhaps this is not so marked as it might be in the particular exhibits under consideration—is the simplification of machines by the abolition of mechanical change-speed gearing by taking advantage of the increased range of speed regulation rendered available in shunt motors by the adoption of interpoles. Small, portable tools, drills, &c., of a class that has only been made possible by the electric motor, were also represented. Another way in which electrical working has shown its utility in machine-shop practice is in the great convenience afforded by such appliances as magnetic chucks, drilling posts, &c. The application of separate motors to the driving of single machines or small groups of machines necessitated more care being taken in proportioning the motor to the work it has to do than the case where one prime-mover covers the power requirements of a number of machines, and in this connection attention may be drawn to a Paper read recently in America by Mr. L. R. POMEROY, which contains some valuable data relating to the power absorbed in various operations in the machine-shop, and is reproduced at some length in another column.

THE case for the promoters of the London and District Electricity Supply Bill is now before Mr. LUKE WHITE'S Committee of the House of Commons, and it presents no new features compared with the position when it left the House of Lords. Despite strenuous efforts on the part of the opposition, those behind the venture express themselves still satisfied with the measure as it stands, although no opinion has yet been expressed upon the Board of Trade report on the Bill, which we give elsewhere. The most important part of this document is that relating to purchase, the period suggested being forty-two years instead of fifty-two years, as stipulated at present in the Bill, and which was agreed to by Lord CROMER'S Committee. This question, however, is left quite open to the Committee to decide. If a scheme of this character is to have a reasonable chance of being put into force within the period named in the Bill, the conditions must be such that the capital can be raised quickly and upon equitable terms. It can, however, easily happen that, if the Committee lend too willing an ear to the arguments that are being advanced for the so-called protection of public interests, the obligations will be too stringent for the promoters if they accept the Bill to be able to raise the capital required. The period of purchase is a case in point. Another is the plea now being urged on behalf of the Borough Councils, that they should be given an absolute veto as to when the power company shall supply in their areas. in other words, the abolition of the Kitson Clause. If the opposition succeed in imposing such onerous terms the Committee would be acting in direct contravention of the opinions expressed both by previous Committees and by members of the Cabinet, to the effect that there is urgent need for a supply of electricity in London on the lines laid down in the Bill. Unfortunately, political forces are still working against the Bill, and if the Bill passes the Committee, there is still the withdrawal of even that moral support of the Government which procured the second reading, to be reckoned with. For the moment, however, a good deal turns upon the closeness with which the Committee adheres to the Board of Trade report, and the evidence of the Board's representatives, which is understood to be coming, will be awaited with interest. It is for this reason that the promoters have not expressed themselves on the report, beyond the statement that clause 77 (power to take transfers of undertakings) which the report almost suggests is an insidious attempt at acquiring a monopoly, is not regarded by the promoters as a vital clause, and they are quite content to have it deleted. The Board of Trade prefer that fresh Parliamentary powers should be sought for each undertaking which the power company wishes to acquire, but this implies, in a way, a want of confidence in the Board itself, as at present, under the Electric Lighting Acts, no undertaking can be transferred without its consent. With regard to the other two Bills, these have now been read a second time, with an instruction that the London County Council shall be the purchasing authority instead of the Borough Councils. What the Borough Councils will have to say to this has not yet been indicated, but it may seem a somewhat irregular procedure to divest them, by means of a clause in a private Bill, of powers granted under a general Act of Parliament. Obviously, some co-ordination is desired, and it is possible that the method proposed is the simplest way out of a difficulty which has arisen on account of the subdivision of London into so many areas, each with its own governing body.

THE possibilities of the trackless trolley system, which have been the subject of reports to several provincial municipalities, have been discussed in connection with somewhat different circumstances by the Highways Committee of the London County Council, who have recommended its adoption in the Blackwall and Rotherhithe tunnels. Previous reports have dealt principally with problems of suburban traffic where only an infrequent service is necessary, and the main point dwelt upon has been the way in which the relative proportions of the capital outlay and the running expenses render the system suitable for work of this class. The case of the London Thames tunnels is different, the traffic is sufficient to warrant the laying of a double line of tramway track, but the ruling consideration has been the fact that, owing to the narrowness of the carriage-way, a double line of non-steerable trams would hopelessly interfere with the ordinary road traffic. The flexibility of the "trackless" vehicle entirely overcomes this difficulty, and should justify its adoption in face of the undoubtedly higher

Digitized by Google

cost of operation for a heavy service of this character. We cannot help thinking that there are other cases of narrow roads with heavy general traffic where the laying of tramways would never have been authorised if some such system had been available. Even now it is not too late to put a stop to the losses occasioned by delays to both tramcar and ordinary traffic in certain stretches of narrow road by the running at connecting-up services of "trackless" vehicles from existing trolley lines.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 5TH.

Royal Society.

4.30 p.m. Meeting at Burlington House. Among the Papers down for reading are the following:—"On the Generation of a Luminous Glow in an Exhausted Receiver Moving near an Electrostatic Field, and the Action of a Magnetic Field on the Glow so Produced," by the Rev. F. J. Jervis-Smith; "The Effect of Pressure upon Arc Spectra, No. 2—Copper," by W. G. Duffield; "On a Method of Computing Inductance and Resistance by the Help of Two-phase Alternating Currents," by A. Campbell.

FRIDAY, NOVEMBER 6TH.

North-east Coast Institution of Engineers and Shipbuilders.

7.30 p.m. Annual meeting at the Literary and Philosophical Society, Westgate Road, Newcastle-upon-Tyne.

Rugby Engineering Society.

8 p.m. Conversazione at the Town Hall, Rugby.

SATURDAY, NOVEMBER 7TH.

The Electrical Football League.

8 p.m. First annual concert at Robertson's Electric Lamp Works, Brook Green, Hammersmith.

TUESDAY, NOVEMBER 10TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. Meeting at the Municipal School of Technology, Whitworth Street. Paper to be read:—"Brushgear," by R. F. Blackmore.

Institution of Electrical Engineers: Glasgow Local Section.

8 p.m. Meeting at 207 Bath Street, when the Chairman, Mr. W. W. Lackie, will deliver his address.

WEDNESDAY, NOVEMBER 11TH.

Institution of Electrical Engineers: Birmingham Local Section.

7.30 p.m. Meeting at the University, Edmund Street. Paper to be read: "The Testing of Alternators," by S. P. Smith.

THURSDAY, NOVEMBER 12TH.

Institution of Electrical Engineers.

8 p.m. Opening meeting of the Session at 25 Great George Street, Westminster, London, when the premiums awarded for the session 1907-8 will be awarded. The President, Mr. W. M. Mordey, will then deliver his Inaugural Address.

Leeds Local Section of the Institution of Electrical Engineers.—Mr. H. E. Yerbury's inaugural address to the Leeds Local Section of the Institution of Electrical Engineers was devoted to a review of some of the leading features of recent electrical engineering progress, and a few speculations as to the future. In reviewing tramway work, he called attention to the way the series motor had become standardised, and pointed out the inferiority of shunt motors, notwithstanding the possibilities of the latter as regards regenerative control. He commented on the trackless trolley system, for which he thought that there was a useful and remunerative field in many districts, as the same overhead equipment could be retained if the population or requirements of a particular district justified the laying down of rails with a frequent service of cars after, say, a few years' running. The field for the single-phase motor for heavy work was also touched upon. With regard to generating plant, the problems of the large continuous-current turbo-generator were as yet not fully solved, and he thought that considerable improvements in steam turbines might be looked forward to in directions which would enable them to be so designed in future that their efficiency would not be impaired by eliminating the very fine clearances which have been the primary cause of considerable trouble in the past. The latter part of the address contained some vague remarks rather outside the range of electrical engineering, and devoted more to the metaphysical than to the physical.

THE SPEECH OF MONS. PAUL BOUCHEROT AT THE DINNER OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE following are extracts from a translation of the speech of Mons. P. Boucherot at the dinner of the Institution of Electrical Engineers, when he responded to the toast of the International Electrotechnical Commission:—I am particularly honoured and fortunate in being called upon to speak on an occasion similar to that on which my revered master, Hospitalier, spoke two years ago. On that occasion, I recall, we had just decided the foundations upon which the Electrotechnical Commission should be built up, but were scarcely able to say anything as to its destiny.

The credit of the success of the movement is mainly due to Colonel Crompton, who was instrumental in calling together the preliminary meeting, and it is largely due to him that there will now be a possibility, in a new direction, of co-ordinating international ideas, of bringing uniformity into the methods of defining these ideas, and also of expressing them in concrete form.

In the pursuit of this work of higher education electricians have always taken a foremost place, although their intervention dates only from the Congress of 1881. In the demain of general education it would not be difficult to trace back the origin of instruction in the history of our race, and, moreover, one could with justice go back as far as the time of Cadmus the Phœnician, who gave the alphabet to the Greeks. This is going back a very long way, but Colonel Crompton will agree with me that that was a great work of co-ordination. Even to-day the question of symbols was discussed, and I should like to be allowed to add that, in my opinion, that is a real matter for standardisation, because it is no doubt due to the fact that the Chinese did not accept the system of Cadmus that they have remained practically stationary during so many centuries.

It has become quite a common thing to speak of progress and its causes; but nevertheless, in my estimation, there is one particular point not sufficiently insisted upon; the evolution of species is so slow that one cannot perceive any evolution in the human brain. For instance, Spencer had one of the greatest brains of the nineteenth century, and yet one could not assert that he was of superior intelligence to Aristotle. True, he lived at a later period, but that is the utmost one can say with any certainty. Until late years archæology was looked upon as comparatively a modern science. The archæological discoveries have, however, brought to light the curious fact that Nabounchid, the last King of Babylon, about 550 B.C., was himself a keen archæologist. The stones he has left behind him bear witness to the fact that, in his researches, he traced back as far as 3,200 years before his own reign, and that he rejoiced, as over a victory, at the discovery of the dedicatory cylinders to the King of the Chaldeans, Naram-sin, who lived about 6,000 years ago. Be it far from me, however, to conclude from this that the ancients had any knowledge of the second law of thermodynamics and the wonderful deductions drawn therefrom by Lord Kelvin. In conclusion, may I remind you that although in the Middle Ages there were many learned men there were no engineers, and the fact that Archimedes, Hero of Alexandria, and perhaps others, were as much engineers as savants does not alter this fact. To change the face of the earth has needed a new social element, to wit, the engineer! Engineers of all countries, be proud of your work, for however small the part played by each individual in this work, he has as much right to be proud of the great engineering achievements as the success of his own country. . . . May the work of the Commission influence the future as did the work of Cadmus influence the past.

Victoria Falls.—In answer to a question by the House of Commons last Thursday, Colonel Seely stated that the title of the Victoria Falls Power Co. to the Victoria Falls and adjoining land, is given in an agreement which provides for the lease of the Falls by the British South Africa Co. to the African Concessions Syndicate, Ltd.

Canada: Proposed Electrification of Canadian Pacific Railway.—It is stated that proposals are under consideration for the operation of about 700 miles of the Canadian Pacific Railway by electricity. The intention is to utilise water power, which is to be found in the vicinity of the line, and some of the directors of Messrs. Siemens Bros. & Co. are mentioned as being identified with the proposition.

The Affairs of the Dolter Electric Traction Co.—In the Chancery Division, on Tuesday, November 3rd, before Mr. Justice Eve, Mr. Vernon moved, in the case of Bock v. the Dolter Electric Traction Co., for judgment in default of defence in a debenture holder's action. Plaintiff is a registered holder of 175 debentures of £100 each, issued on August 2nd, 1907, which had since become due. The company, said counsel, since the issuing of the statement of claim, had gone into liquidation. His Lordship made the usual order.

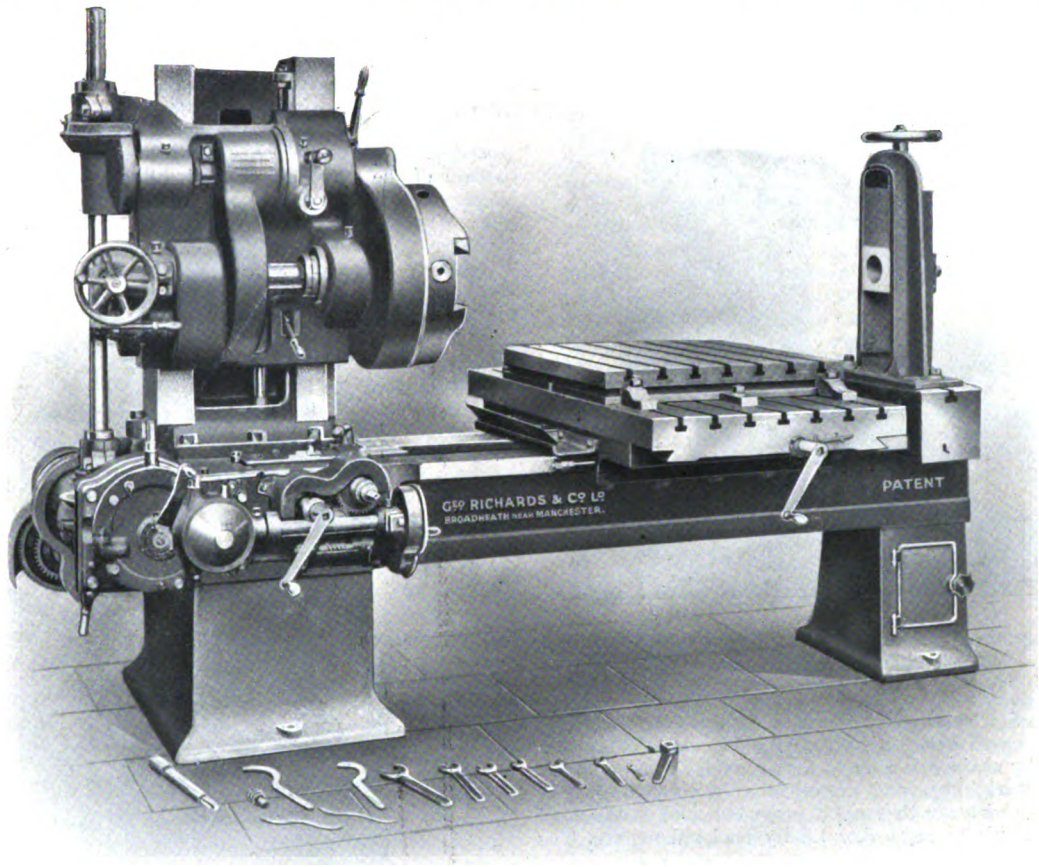
MACHINE TOOLS AT THE MANCHESTER ELECTRICAL EXHIBITION

George Richards & Co., Ltd.,

BROADHEATH, NR. MANCHESTER. (STAND NO. 52.)

The firm's latest pattern of universal facing and boring machine is seen below. All its feeds are automatic, including the cross-feed to the table and the vertical feed to the head. The spindle carrying the facing head is of exceptional strength, ground to fit its bearings, which are of phosphor bronze. The front bearing has very ample wearing surface, and its shape is designed to reduce to a minimum the friction and wear caused by taking heavy facing cuts. A tool slide, made extra long to ensure freedom from jar, is actuated by a screw. It is provided with an opening and substantial clamping bolt for securing a tool of square section, which is firmly held. A facing with a circular recess is also formed on the tool slide and is used for mounting special tool holders and milling cutters, and for securing boring bars. Provision is made for quickly centreing this appliance. The machine is fitted with a square top table revolving easily upon a strong central pin. The table may be revolved through any angle and clamped accurately, and it is particularly easy to clamp it accurately square at each quarter turn.

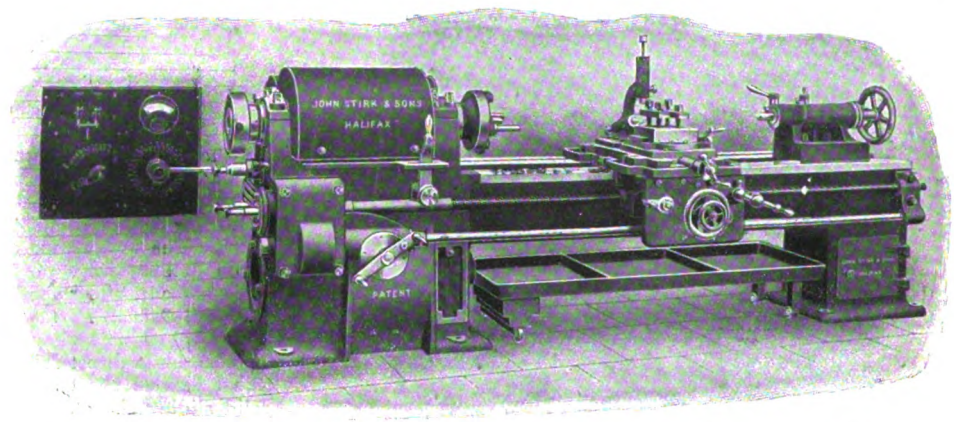


Universal Facing and Boring Machine, with facing head geared direct, with suitable speeds for drilling, and with all feeds automatic. (George Richards & Co., Ltd.)

John Stirk & Sons, Ltd.,

OVENDEN ROAD, HALIFAX. (STAND NOS. 287 & 288.)

Electrically-driven Machine Tools.—The exhibit of this firm included the six-inch slotting machine, illustrated on the next page, which is fitted with their self-contained motor drive. The motor of this machine is wound to give 1½ h.p. at any speed between 500 and 1,500 r.p.m. The frame of the motor, which is of the Lancashire Dynamo and Motor Co.'s make, is, as can be seen from the illustration, part of the body of the slotting machine. A chain transmits the power to the pinion shaft, and a further reduction is accomplished by the usual gearing at the back of the machine. A total purchase of about 18 to 1 is provided.

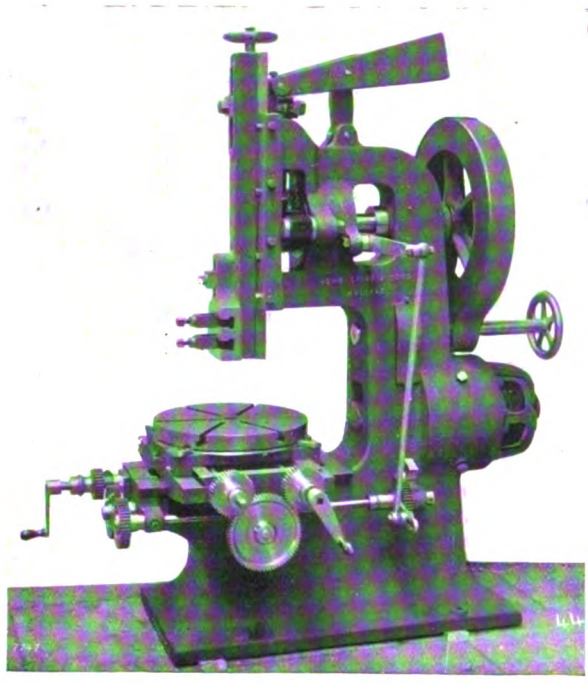


8-Inch High-speed Lathe with all Gear Headstock and Self-contained Motor Drive. (John Stirk & Sons, Ltd.)

and this gives a suitable number of strokes per minute. As with a six-inch machine it is not to be supposed that shorter stroke than two ins. would ever be used, the range of speed provided in the motor is all that is required. The speed regulator is so marked that the operator can see at a glance what is the correct position of the controller arm for the work the machine is engaged upon. This firm also exhibited a large high-speed lathe, and several

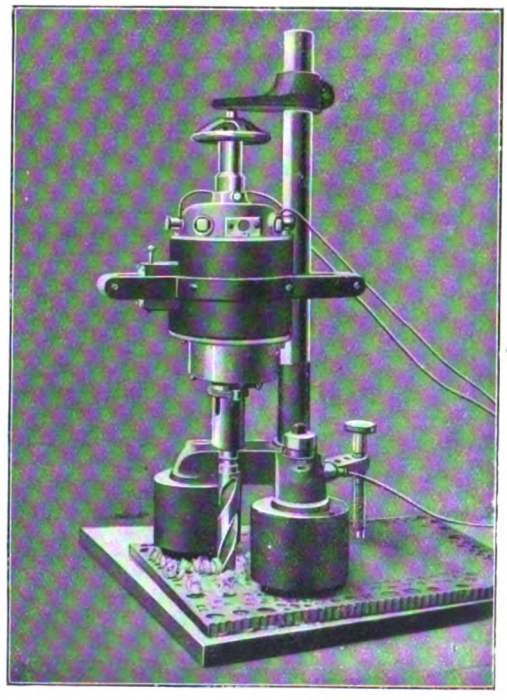
Digitized by Google

photographs of electrically-driven drills, lathes, and boring mills were shown. A fine example of an electrically-driven 8-ins. high-speed lathe is also illustrated. This is a similar lathe to that exhibited, except that it is fitted with the firm's patent motor



6-Inch Slotting Machine with Self-contained Motor Drive.
(John Stirk & Sons, Ltd.)

drive. Combined with the box end is a 7½-h.p. electric motor, running at any speed between 400 and 1,200 r.p.m. The power is transmitted by chain drive up to the spindle. This construction gives great rigidity, and accomplishes a great saving in floor space. The motor is thoroughly protected, and at the same time is as accessible as any other totally enclosed motor. The



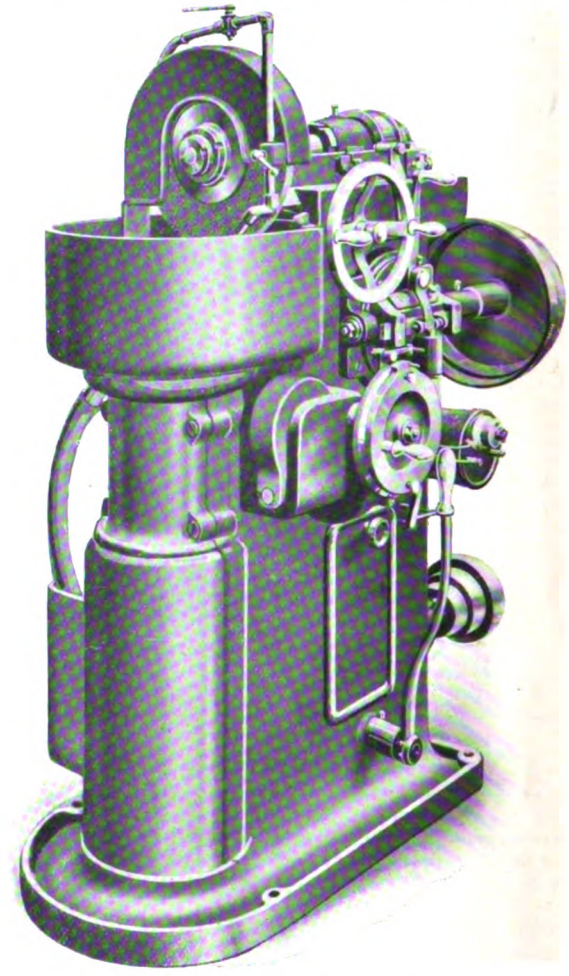
Tripod Magnetic Drill Stand and Electric Drill.
(United States Metallic Packing Co., Ltd.)

headstock gearing is designed to stand the heaviest strains the drive can put upon it. The cutting speeds are 40, 60, 80, and 120 ft. per minute; any one of these having been selected, it can be maintained on any diameter between 2½ ins. and 7½ ins.

United States Metallic Packing Co., Ltd.,

SOHO WORKS, BRADFORD, YORKS. (STAND NO. 94.)

Portable Drills and Magnetic Drill Stands.—The accompanying illustration shows a new design of magnetic drill stand which has recently been developed by this company. It will be noticed that it has three points of contact, which gives a firmness and rigidity unattainable with the usual single magnet form. Two legs of the tripod base are magnet poles, which are surrounded with the exciting coils. The latter are enclosed in strong water-tight brass cases. The third leg carries an adjusting screw, and takes the thrust of the drill-feeding screw on the arm of the drill stand. As shown in the illustration, the drill is set up centrally between the magnet poles, by which means the full pull of the magnet is obtained on the drill. A switch of the quick make and break type is provided on the base of the stand. The drill pillar and base are of steel, and



Grinder with Magnetic Chuck.
(Chas. Churchill & Co.)

are hollow. Our illustration shows a hand electric drill in use on the drill stand. This pattern of drill is made in two sizes, ¼ h.p. and ⅝ h.p. respectively, and is fitted with a series-wound motor, which is completely enclosed and suitable for outside work. The largest size of drill stand, which is suitable for use when drilling holes up to 1¾-in. diameter, takes 1 ampere at 200 volts and weighs 95 lb.

Direct-Driven Portable Electric Drill.—An example of this firm's patent portable electric drill, which, contrary to the usual custom, has a direct drive, was shown working on the stand. The usual flexible shafts, knuckle joints, &c., are superseded by a solid sliding shaft and a universal movement drill-head, which enables the machine to be worked in practically any position whilst reducing the loss of power in transmission to a minimum. The controlling switch is placed on the drill-head, which gives the operator instantaneous control. A flexible cable connects the switch to the motor. One of the new tripod drill stands was shown in use in connection with the direct-drive portable drill described above. Thus, instead of using the small drill, as shown in our illustration, a larger motor can be used with the aid of the shaft drive to run a drill supported on the tripod stand.

Digitized by Google

Metallic Packing.—A representative exhibit of the various patterns of metallic packing manufactured by the company, including examples of block packing for use with medium and low pressures, and duplex packing for use with high pressures, was shown. A form of double cone packing, especially suitable for Corliss valve spindles, was also exhibited.

Chas. Churchill & Co., Ltd.,

OXFORD STREET, MANCHESTER. (STAND NO. 292.)

Machine Tools.—A large number of machine tools, among which were various patterns of high speed drills, Lodge & Shipley patent-head lathes, Grant rivet spinning machines, and grinding machines, were exhibited by this firm. Among the grinding machines was one which has been especially designed for grinding piston rings for automobile and gas engines, discs, saws, dies, and annular surfaces, either flat, convex, or concave. The body of this machine, which we illustrate opposite, carries a long sleeve in which runs a vertical spindle carrying a magnetic chuck. This sleeve has a micrometer vertical adjustment and power feed with automatic stop, thus allowing a large number of pieces to be ground to absolutely correct thickness, with little or no change of adjustment when using a wheel of suitable grade. The feed operates at each end of the stroke, and can be varied from 0·0001 to 0·00075 inch. The magnetic chuck is specially made to allow for wet grinding; it has six changes of speed for varying diameters of work, and can be instantly stopped without stopping the machine. The consumption of the chuck winding is from 60 to 80 watts, and it can be connected directly to the 110 or 220-volt lighting circuit if this be direct current. A fine radial finish is obtained with this machine. After a piece of work has been finished on this grinder, it retains a certain amount of magnetism according to the hardness of the steel. To get rid of this a special demagnetiser is required. This is simply a low-frequency alternating-current electromagnet, contained in a box. The laminated core and the windings are inside the box, as is also the alternating-current generator. Current for exciting the field magnets must be taken from the lighting circuit, and terminals for this purpose are provided at one side of the box. The excitation windings consume about 75 watts. In cases where no direct-current is available another form is made. This contains a generator in the body of the demagnetiser provided with both slip-rings and a commutator, and thus, besides being a self-contained demagnetiser, current can be taken from the direct-current side for supplying the magnetic chucks of the machines. All traces of magnetism are removed from any piece of work by merely passing the article over the pole faces. Demagnetising is most important in the case of cutters, as if left magnetised, they would gather a covering of chips and dust. Magnetic chucks for fixing to lathes were also shown by this firm. They are totally enclosed and watertight; the current is conveyed to the winding by contact rings on the back. The current consumption is about 40 watts. A variety of portable electric drills and grinders were also exhibited. The machines on this stand were driven by motors manufactured by Electromotors, Ltd.

William Asquith, Ltd.,

HALIFAX. (STAND NOS. 168 & 169.)

Radial Drilling Machines.—Four large drilling, boring, and tapping machines were exhibited by this firm. The most interesting of these was a 6 ft. central thrust radial drill for high speed work, with a double arm. An important feature of this machine, which is quite new, is the construction of the arm. The portion of the arm in which the spindle slide works is of the box girder section, and the spindle works midway between the two long walls of the arm, ensuring a central thrust, and entirely eliminating side twisting strains. The lifting stresses are distributed over a large area on the underside of the arm. The thrust pressure on the spindle is taken by a ball thrust bearing. This 6 ft. machine and all larger are fitted with a fine radius motion, which allows of the arm being easily and accurately adjusted from the workman's position by the slide, and which can be thrown out of gear when it is required to swing the arm rapidly round. By the use of a simple tie rod the machine can be quickly converted into a rigid vertical boring machine. Double gear is provided on the spindle slide, and the spindle is fitted with a clutch motion. These enable the spindles to be started, stopped, or reversed without using belt motion, and further when tapping, the reverse speed can be made quicker than the tapping speed. A variable self-acting feed motion is provided, and a large number of cutting speeds can be obtained. Change of speed can be effected whilst the machine is running. The other machines which were shown had the usual single arm, which carries the spindle on one side.

Bateman's Machine Tool Co., Ltd.,

PLANER WORKS, NEAR HUNSLET, LEEDS. (STAND NOS. 90 & 91.)

High Speed Planing Machine.—A fine example of the line of high-speed planers manufactured by this firm was exhibited. This size of planer has a stroke of 10 feet, and a range of 3 feet either way. The machine is driven by a Siemens' three-phase motor supported on the top of the frame, and has three cutting speeds of 20, 40, and 60 feet per min., with a constant return speed of 176 feet per min. The chief feature of the machine is the patent flywheel drive, by means of which the reversals are made promptly and acceleration is rapid. An automatic friction clutch is fitted between the fly-wheel and the fast pulley on either side; one flywheel operates the cut and the other the return. The belts are wider than the fixed pulleys, and overlap on to the fly-wheel pulleys, so that they take up much of the stored-up energy of the flywheel. In the ordinary rack-driven machines the rack is bolted direct to the table, but in this machine the rack has a short longitudinal motion in a groove on the underside of the table. Spindles are secured to a cross-head at one side of this sliding rack, and these spindles carry adjustable springs. The latter absorb all the shock of reversal, and so enable the machine to be run at a very high speed, without either shock or strain on the toothed gearing and driving belts, owing to the elastic action of the springs.

Consolidated Pneumatic Tool Co., Ltd.,

PALACE CHAMBERS, BRIDGE STREET, WESTMINSTER. (STAND NO. 225.)

Portable Tools.—This company exhibited at the stand of Messrs. Steinthal & Boydell, their Manchester agents, a large assortment of electrically-driven portable tools, including a magnetic drilling post with a circular magnet giving a very firm hold. There was a complete range of electric drills, both with single and double armatures. A portable blower for cleaning purposes is a piece of apparatus that has elicited many inquiries owing to its numerous applications. A neat, self-contained motor-grinder, and a lathe grinder for fixing on the lathes to true up the lathe centres were also exhibited.

Alfred Herbert, Ltd.,

COVENTRY. (STAND NO. 87.)

Sensitive Drilling Machine.—A 3-spindle sensitive drilling machine was shown at work to demonstrate its extreme speed which enables the best results to be obtained from high-speed drills of small diameter. A maximum spindle speed of 2,050 r.p.m. is obtained, at which a ¼ in. hole may be drilled to a depth of 1 in. in cast iron in 1 1·5 seconds. This high speed is rendered possible by the use of ball bearings throughout. "Single track" ball bearings are used. It is claimed that the bearings need only be lubricated once a year.

Hexagon Turret Lathe.—The 1908 pattern of this lathe, which embodies some improvements in detail, was shown. The roller-steady turning tool enables very rapid work to be turned out. The lathe exhibited will admit bars up to 2¼ in. diameter, and has a working stroke to the turret of 30 in. in length.

Automatic Turning Machine.—This was at work finishing small pulley castings, and an ingenious chuck was used for gripping these, obviating the necessity of adjusting an internal chuck. On the machine being started, all the operations of centreing, drilling, turning, facing, forming, &c., proceed automatically, until the piece is finished, when the machine stops. The "self-selecting" feed motion gives seven feeds for each cam, the changes of feed being made automatically by the machine. With this feed motion all the feeding cams are alike, and there is a change-feed dog for each cam having seven holes. Into any one of these holes a pin can be placed, the pin setting the feed to the required rate. To change the feed for any tool, the pin corresponding to it is simply placed in the hole relating to the feed which is required. The quick or idle motions are obtained by a constant-speed pulley on the countershaft, and the feeding motions by gearing from the headstock. The whole range of seven feeds can be raised or lowered in rate by change gears to suit the different classes of work. This feed motion renders the machine adaptable for a great variety of work, especially where quantities are not very great, and where changes in the setting of the machine are frequently required.

Digitized by Google

Luke & Spencer, Ltd.,

BROADHEATH, NEAR MANCHESTER. (STAND NOS. 43 & 44.)

Tool Grinder.—A new patent tool grinder with some interesting features was exhibited by this firm. The wheel is of sapphire corundum, and the patent fountain tool rest fitted to the machine ensures a continuous flow of water on to the edge of the tool. The water is pumped into the tool rest itself, from which it is emitted in the form of a number of small jets which converge towards the centre of the wheel face. The inner jets impinge on the tool, and the outer jets play on to the wheel just above the tool; thus, the point of the tool is covered with water, above and below. The wheel is fitted with the firm's patent adjustable guard.

Saw Grinder.—This tool, which was shown working, is a grinder for circular wood-cutting saws, and can be adapted for grinding band saws, by attaching two extension bars with pulleys, which are supplied with the machine. A large number of other grinding tools were exhibited by this firm; these included an automatic surfacing machine, a motor-driven double emery-band polishing machine, and a commutator grinding apparatus.

Mayer & Schmidt,

OFFENBACH A MAIN, GERMANY. (STAND NOS. 8 & 55.)

Automatic Twist Drill Grinding Machine.—This was perhaps the most interesting exhibit on this firm's stand, as the machine grinds twist drills to the proper angle entirely automatically. The drill is held in a chuck and brought up to the emery wheel, given the necessary rotary and angular movement, and then turned so as to bring the opposite side of the drill to the wheel. This complex motion is obtained by a cam mechanism. Both the clearance and the cutting angle can be altered whilst the machine is running. The machine is fitted with a rotary pump to supply the water for the wheel, and a special attachment for pointing the drills.

Emery Grinder and Disc Grinding Machine.—The first of these machines is for rough grinding work, and the chief feature of interest is the method of removing the dust. The table rests are hollow, and a small fan driven from the machine sucks the dust down into the body of the machine. Here the dust is filtered from the air before it passes into the room. The accumulated dust must, of course, be removed from the filter in the body of the machine periodically. The disc grinding machine, which is suitable for rapidly grinding flat surfaces, such as commutator bars, brush holders, switch-blades, &c., is fitted with a similar dust exhauster.

Automatic Cutter Grinding Machine.—This machine is for sharpening straight, spiral, conical, or face milling cutters up to 8 in. in diameter, and 24 in. in length. The grinding wheel is provided with an automatic feed. The cutters are fixed on a mandrel between centres, and automatically ground with the greatest accuracy.

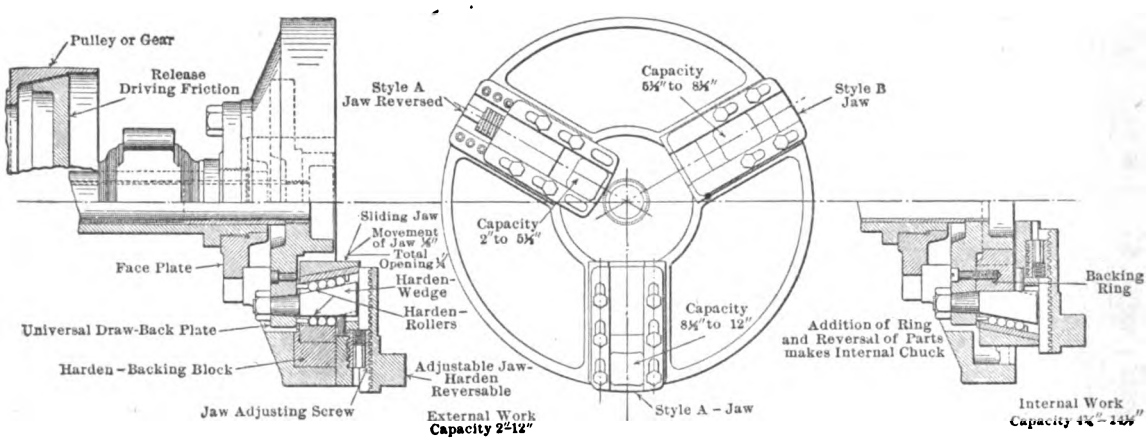
H. W. Ward & Co.,

BIRMINGHAM. (STAND NO. 156.)

Four Spindle Automatic Machine.—The feature of this machine is that all the tools operate simultaneously. The piece of work is brought round to each tool in succession, but four pieces are worked on at once. The tool support only moves longitudinally to feed the tools up to the work. The speed of the screwing spindle of the tool head can be varied by means of a cone of gears; this enables the speed of the tap or die to be increased when tapping or screwing a fine thread. The hole in the spindles will pass a 1 in. bar and the length turned is 4½ in.

Automatic Bar Chuck.—A new high-speed automatic bar chuck was also shown by this firm. The working parts of this chuck are all enclosed and are operated by means of a lever keyed on to a short shaft carrying a pinion. The pinion gears into a toothed segment of the inner sleeve of the chuck, and when this is rotated, a lateral movement is effected, by means of two spiral grooves in the sleeve, in which two stationary white metal keys engage.

G. Harland Bowden & Co., 196 DEANSGATE, MANCHESTER. (STAND NO. 92.)—*Planing Machine.*—The exhibit on this stand was to illustrate some methods of electric driving of which the firm make a speciality. The principal exhibit was a 23 b.h.p. slow speed motor arranged for driving a reversing planer, and this was shown working with automatic switchgear to secure reversal at the end of each stroke. A magnetic brake attached to the motor comes into operation directly the tappet switch is locked over into the reverse position by an arm attached to the moving planer table. As the motor slows down, the current is automatically reversed; this disengages the brake and starts the motor in the opposite direction. The total time taken in the reversal of the whole of the gearing and table from full speed in one direction to full speed in the other direction is about five seconds. The motor is fitted with interpoles and designed to give a heavy starting torque. Another motor was shown coupled direct to a special triplex reducing gear, by means of which the motor speed of 1,500 r.p.m. is reduced to 75 r.p.m. The efficiency of this reducing gear is stated to be from 94 to 96 per cent.; the high and low speed shafts are axially in line, which results in a very compact drive. This motor also was operated by automatic starting gear. Among the other exhibits were a standard three-panel switchboard and various patterns of starting gear.



Details of Garvin Automatic Chuck. (C. W. Burton, Griffiths & Co.)

C. W. Burton, Griffiths & Co., LUDGATE SQUARE, LONDON, E.C. (STAND NO. 27.)—The most interesting thing shown at this stand was a new automatic chuck. On a treadle at the base of the lathe being depressed, the lathe is stopped, and at the same time the chuck is opened automatically. When the treadle is raised again, the piece is gripped, and the machine starts. The chuck is arranged to grip eccentric or angular work, and to hold the work by the outside or inside as required. The drawing above shows its construction. The jaws are operated by hardened and ground wedges with rollers. The wedges are attached to a common disc, which is drawn back by a very powerful spring in a box overhung beyond the end bearing, and not seen in the drawing. On each sliding jaw an adjustable gripping jaw is mounted, which has a fine screw adjustment, and can be clamped in any position, and bound by six bolts. Among the other machines exhibited was a universal milling machine, driven by a single pulley. The spindle is driven by gearing inside the body of the machine, so arranged that 18 speeds can be obtained without stopping or interfering with the machine. The feed changes are twelve in number, and these can be changed without altering the spindle speed.

Cunliffe & Croom, Ltd., BROUGHTON IRON WORKS, MANCHESTER. (STAND NO. 296.)—Among the machines shown by this firm was an upright drilling machine with sliding head and 30 inch swing. A positive gear feed, giving three rates of feed ranging from 0·005 in. to 0·015 in. per revolution of the spindle is furnished with this machine, and a hand worm-wheel feed and quick

Digitized by Google

hand-wheel return are also provided. Eight spindle speeds, ranging from 23 to 400 revs. per min. can be obtained. Another interesting machine was a 51 in. vertical turning and boring mill with a motor drive. The speed changes in this machine are obtained by means of differential gear operated by a lever. By this means, eight speeds are possible without the use of a variable speed motor. The two heads are quite independent of one another, and will swivel for angular work to an angle of thirty degrees. Eight changes of feed are obtainable at each of the eight speeds. Other machines, including a 6 ft. by 2½ ft. planer, disc grinders, and milling machines, were exhibited.

H. Luke, Ltd., 12 & 14 Brazennose Street, Manchester. (Stand No. 212.)—A boring machine, of considerable use in wiring work, was exhibited. This consists of a long steel tube, to the extremity of which a bit is fixed at right angles. A chain which passes over the toothed wheels to which the bit is geared permits of the bit being worked in positions otherwise difficult of access. Joists in flooring can be easily pierced for wiring purposes with the aid of this machine.

B. & S. Massey, Openshaw, Manchester (Stand No. 282).—*Power Hammer.*—A 3-cwt. electro-pneumatic power hammer, which was at work, attracted considerable crowds. The hammer is worked by a 7-h.p. Lancashire Dynamo & Motor Co. motor running at 850 r.p.m. This drives a pump through a single reduction spur gear with a raw-hide pinion, by means of the ordinary crank and connecting rod, and air is thus supplied directly to the cylinder of the hammer. There is thus direct pressure, both for the working stroke and the lifting stroke, and the amount of air, and thus the severity of the stroke can be regulated either by a foot pedal or by hand. It is also possible to hold on the hammer under pressure for bending, &c. In addition to this the firm exhibited a self-contained 3-cwt. friction drop stamp, driven by an electric motor, which can be regulated with extreme ease.

Oliver Machinery Co., Ltd., 201-203 Deansgate, Manchester. (Stand No. 283.)—The chief exhibit of this firm was a disc wood grinder for pattern shops. Canting rests, and a fan exhaust for the dust are fitted to this machine. The glasspaper is clamped to the steel discs by metal rings. A pattern of band saw, which was exhibited, is fitted with a spring tension device instead of the usual weight in the body of the machine. Automatic saw filers were also exhibited. The chief feature of these machines is that the file is given the same motion as it would have were a man doing the work. The machine for filing band saws was fitted with side and top brushes for cleaning the saw.

Frank Pearn & Co., Ltd., West Gorton, Manchester. (Stand Nos. 178 & 228.)—*Surfacing, Boring, and Milling Machine.*—The principal exhibit on this firm's stand was a large surfacing, boring, and milling machine. Attention should be drawn to the method of driving the spindle of this machine; the pulley, which is mounted on the spindle between the bearings, is belt driven, thus eliminating the usual bevel gearing. For heavy duty with consequently slower speed, ordinary spur back gearing is brought into requisition. The speed, feed, &c., are controlled by levers conveniently placed at the front of the machine.

John W. Perkin, Lord Street Works, Leeds. (Stand No. 234.)—This firm exhibited a representative selection of their machine tools, which include screw-cutting lathes, high-speed sensitive drilling machines, hack saws, and twist-drill grinders. A self-acting shaping machine, in which the return stroke is quicker than the working stroke, was also shown.

Pollock & Macnab, Ltd., Bredbury, near Manchester. (Stand No. 110.)—This firm exhibited lathes with single pulley drive, and with heads having self-contained gears which enable the speeds to be obtained without a countershaft. A similar device has also been used by the firm in connection with their drilling machines. Among the lathes of this type shown was a capstan lathe for chuck work up to 18 in. diameter, and capable of taking bars up to 2½ in. diameter. The sixteen spindle speeds are obtainable by moving four handles on the head. One of these has a position for putting the pulley out of gear, and all are so interlocked that it is impossible to damage the gear by endeavouring to put on two speeds at once. The machine has eight feeds forward and eight reverse, and the changes are made simply by moving a pointer to the position indicated on the part of the feed-box. These and other ingenious devices in the design of this machine and the turret lathe which was shown attracted much favourable attention at the exhibition.

C. Redman & Sons, Pioneer Iron Works, Halifax. (Stand Nos. 170 & 171.) Two large machines were exhibited by this firm. One of these was a large planing machine capable of taking a cut of ⅜ in. by $\frac{1}{2}$ in., and having a range of 6 ft. by 2½ ft. This machine is provided with a patent four-speed countershaft, giving four rates of cutting with a constant speed return. The other machine shown was a lathe with 10 in. centres and 12 ft. gap bed, specially suitable for roughing out shafts from the solid forging. A new pattern of easily adjustable feed is fitted to this lathe, and six rates of feed are obtained. The lathe was driven through belt gearing by a 30 h.p. motor.

J. Rhodes & Sons, Ltd., Grove Ironworks, Wakefield. (Stand No. 30.)—*Power Presses and Shears.*—Three examples of the power presses for use in the manufacture of sheet metal stampings and manufactured by this firm, were exhibited. The chief feature of these machines is the patent safety clutch which prevents the press from working more than once after the treadle is depressed. Before a second stroke can be obtained the treadle must be released and again depressed. This safety clutch renders the machines as safe to work as hand presses. One of the machines had a cam-actuated die-slide which automatically brings the bottom die to and from the punch. All the machines can be worked in the upright or an inclined position. The high speed shears exhibited by the firm were also fitted with the above safety clutch and although the treadle may remain depressed, another descent of the blade cannot occur.

Thomas Robinson & Sons, Ltd., Rochdale. (Stand Nos. 23 & 45.)—*Wood-working Tools.*—Perhaps the most interesting tool exhibited by this firm was a two-spindle saw bench, suitable for all kinds of accurate sawing, such as is required in pattern-making, cabinet-making, fine joinery, &c. The table is divided into two sections, the back section being fitted with an adjustable bevelling fence, and the front section with angle fences for cross-cutting and mitreing. The table can be quickly canted to any angle up to 45 degrees, and can be locked so as to be perfectly rigid in any position. The machine has two saw spindles, one to carry a saw for cutting with the grain, and the other one for cutting across the grain. Either of these saws can be quickly brought above the table for work; as the one rises, the other descends below the surface of the table and at the same time falls out of contact with the driving belt. The change-over can be accomplished when the machine is running. The machine shown was belt-driven by a motor of the Lancashire Dynamo & Motor Co.'s make. A large vertical hollow chisel mortising machine designed for heavy mortising, recessing, and tenoning, as used in railway carriage and wagon shops, was also exhibited. The sliding headstop, on which the mortising ram reciprocates, rests on roller bearings in planed ways, and these enable it to be easily moved by a cutrack and pinion. The stroke of the chisel ram is variable, and is controlled by a hand-lever. The auger, or bit, which revolves inside the square hollow chisel, is driven over turn pulleys from the back of the machine. Among the other exhibits were a 36 in. band sawing machine, a continuous roller-feed saw bench, and a tenoning machine.

Union Standard Machine Co., 165 Queen Victoria Street, London, E.C. (Stand Nos. 193 & 208.)—The principal exhibit of this firm was a number of patterns of portable wrought iron work benches. These consist of tripods on which either a bench vice, or a pipe vice, or both are fixed, together with a tray for small tools. The workman stands on a step attached to the base of the tripod, and thus uses his own weight to steady the bench. A large number of small punching and shearing machines, and other small tools were exhibited by this firm.

G. Birch & Co., Islington Tool Works, Salford. (Stand No. 15.)—*Grinding Machines, Slotting Machines, &c.*—A description of the exhibits on this stand appeared in the supplement of our issue of October 15th (p. 29).

Henry Wallwork & Co., Ltd., Roger Street, Manchester. (Stand No. 42.)—*Gear-Cutting Machines.*—A description of this firm's exhibits appeared in the supplement to our issue of October 22nd (p. 37).

The Electron.—The October number of this magazine, conducted by the employees of Messrs. Siemens Brothers' Dynamo Works, Ltd., Stafford, contains an article by Mr. C. H. N. Chamen on "High Voltage Transmission and Distribution." The series of biographical notices of prominent members of the Siemens family is continued, and a portrait of the late Carl H. von Siemens is given. The frivolous portion of the contents is represented by a delightful conversation between the well-known Mr. Dooley and another, by an author who modestly signs himself "Z." Other articles deal with the new Patent Act and Reminiscences of an Englishman's First Visit to Germany.

REVIEWS OF BOOKS

Cranes. By Anton Böttcher. Translated by A. Tolhausen. 492 pp. 556 illustrations. 10¾ in. by 7½ in. (London: Archibald Constable and Co.) 42s.

This monumental work deals with the entire practice of crane building with an exhaustiveness which does great credit to the industry both of the author and the translator. Mr. Böttcher's portion of the book deals with cranes and appliances of German design only, and a large portion of the information he gives is the outcome of his connection with the conversion of the Stettiner-Vulcan workshops to electric driving. Mr. Tolhausen is responsible for the translation of Mr. Böttcher's work from the original German, and for a large amount of supplemental information of a general nature upon English and American practice, in addition to an introductory chapter which contains some pithy remarks anent the inroads made recently by German manufacturers upon a field of enterprise for many years looked upon by English engineers as peculiarly their own.

Perhaps nothing is more clearly illustrative of the comparatively recent growth of the German crane industry than the complexity of type and design exhibited, and whether German practice will eventually settle down to the use of a few well-marked types proved through experience to be the most satisfactory, is a question which only time can answer. There can be no doubt as to the vast amount of calculation and consideration expended over every detail, although this would appear to have complicated and lightened the structures in a manner hardly in accordance with English ideas. Possibly competition with German designers may influence English practice to some extent in their direction, and there is an equal possibility that experience may lead the Germans some way towards English ideas of solidity and simplicity of structure.

Mr. Böttcher's book offers a vast fund of information upon all aspects of continental design, and includes exhaustive tables of calculations. His chapter upon chain-driving and the figures given therein should prove extremely interesting to English engineers, and lead them to understand the predilection shown by their German competitors for this method of transmission.

The method of arranging the different sections is much to be commended; the opening section embodies the first principles of mechanics involved in the design of cranes and other lifting machinery, with illustrative diagrams and figures, and is immediately followed by a profusely illustrated chapter upon general designs of cranes. This principle is followed throughout the book, the formulæ applying to each class of mechanism are fully explained and set out, being followed by photos and descriptions of foreign cranes actually at work, with the designers' calculations fully detailed. These should prove extremely interesting to English engineers, and it is, perhaps, regrettable that the English and American examples added by Mr. Tolhausen do not embody the same amount of information for purposes of comparison. At the end of the book are supplementary tables of profiles and moments of inertia.

The book is well translated and conveniently arranged, and the illustrations are of good class. The single volume, is however, rather bulky, and might with advantage be split into two volumes of more convenient size. One thing, however, may be said, and that is, that the book is of great interest throughout, and the attractive method of arrangement never permits interest to flag.

Power Railway Signalling. By H. Rayner Wilson. 339 pp. 12 in. by 9½ in. 623 illustrations. (London: "The Railway Engineer.") Price, 18s.

Mr. Wilson's book will take rank with his work on "Mechanical Railway Signalling" as an up-to-date book of reference, indispensable to the railway signalling engineer. Portions of it are also of interest to railway men generally, and to others who like to know the technicalities and the trend of development in departments outside their own special work. Such portions are those which discuss the pros and cons of "lock and block" systems, with "track circuiting" as an alternative; the apology for the American use of the "train order" system; the discussion of automatic signals, and of interlocking power plants. These discussions show a breadth of mind and impartiality which are rare and refreshing in the writings of men like our author, who are generally and necessarily biassed by their own experiences, and are rarely able to conceal their bias. This is not to say that the author has no opinions of his own, far from it; but he can see how far differing conditions and circumstances compel or justify variation in methods and state the case with much lucidity and fairness. The non-specialist reader will also find some interesting and probably surprising figures as to the extent to which automatic signals, power operation, and track circuiting are already used in this country, but he will also perceive that the number of adaptations and combinations of systems is sufficient to prove that there is no such general consensus of opinion as to foreshadow the early general adoption of any particular one.

The chief interest of the book must be for the specialist, and lies in the description of the apparatus used and its various combinations to meet the many requirements of railway working. The inclusion of the ordinary block signalling instruments may seem a little outside the range of the title, but it is the logical and proper introduction to the subject, leading up to the modern "all-power" operation of points and signals. The conscientious reviewer finds himself in a difficulty in criticising a work like this, which is mainly concerned with detailed descriptions of highly specialised machinery, and it cannot be claimed by this one that every description has been read and checked. But from selected samples it can be affirmed that the descriptions are clear and intelligible, with a slight tendency to over much conciseness, which is rather a virtue to the specialist reader, and assisted by diagrams and figures generally excellent, but in many cases lettered in too minute a type for quite easy reading. The electrical engineer will not find electrical details very fully dealt with, and we particularly note the absence of quantitative discussion of the insulation and conducting qualities of ballast and rails, and the relation of battery power and relay windings, in reference to track circuiting. Nor is there much said about the cost and expenditure of the various forms of power, of which the use is described. These omissions, however, detract little from the value of the work to those for whom it is specially intended. The printing, illustrations, and general get-up are excellent, but we personally find the shape and size somewhat awkward.

Laboratory and Factory Tests in Electrical Engineering. By George Sever and Fitzhugh Townsend. 269 pp. 98 illustrations. 6 in. by 9¼ in. (London: Archibald Constable & Co.) 10s. 6d.

This octavo volume has 269 pages and 98 figures all of a diagrammatic character, and is creditably pro-

Digitized by Google

duced. We read its title and noted the ground covered by the book with agreeable anticipation, because a work handling the subject ably would be of great use to students and to test-room assistants. It is, however, in some ways disappointing. One point at least we can commend which is in a measure the keynote of the book, and in all testing for whatsoever purpose its importance can scarcely be overrated. "Before commencing any experiment or test," the authors tell us on p. 1, "its description should be carefully studied in order to obtain a clear understanding of its object and the method of procedure"; nor do they allow this extremely desirable, if little recognised, phase of testing to drop out of sight at any point of their treatment of the subject. We were also glad to remark that all descriptions are easy and free from obscurity, and as far as ready accessibility is concerned the information is well presented. It is rather in matters of detail that we are disposed to differ. To put our accusation in a word, the book is not practical; its sins of omission are especially extensive, and it is difficult to avoid the impression that the authors' recent experience of testing is confined to the small machines and apparatus found in a college workshop. For example, a large amount of space is devoted to discussing the determination of characteristic curves of various types of machines, many of which are of no practical value; whereas the testing of large machines by the various varieties of the so-called Hopkinson method are not even alluded to. Again, what test-room could be called approximately complete without water-tanks or tubs for testing dynamos, and water-brake pulleys for testing motors. The only Prony brakes described, if applied for more than a few minutes to any motor of more than 10 h.p., would certainly burn up, and from the absence of any description and instructions in their management we must suppose that the most important modern development in direct-current machinery, namely, the commutation pole, is beyond the authors' ken. We do not share the authors' view that the most accurate measurement of the efficiency of a dynamo or motor is to be got by running it on light load, and we own to feeling a prejudice against a book on testing which leaves untouched the subject of how to devise a convenient and practical temperature test for a motor whose duty is intermittent. We know it may be urged that these are matters for a more advanced work, and that a student properly grounded in first principles may evolve his methods for himself. He may; but why not save him time and many a mistake by giving him a book in which the experience of practical men is properly explained?

On the other hand, we like the simplified description of the Heyland diagram for induction motors, and with the exception of one or two slips, as, for instance, on p. 116, where we find the curious inversion "$\text{Flux} = \frac{\text{Reluctance}}{\text{Magneto Motive Force}}$" the alternating-current matter is usefully presented. We do not believe, however, that the authors can have handled all the instruments described in the third and last part of the book, where the practical points about a Kelvin galvanometer, a d'Arsonval, a Secohmmeter, and a Kelvin ampere balance have been excluded in favour of a good deal of less appropriate and somewhat mathematiculistic theory.

THE CONDENSER IN TELEPHONY

By G. M. B. Shepherd

THE recent I.E.E. Paper by Mr. G. F. Mansbridge has drawn attention to the magnitude of the present demand for low-priced condensers of the foil and paper pattern, as exemplified by the statement that the factory output for the year 1907 amounted to 5 farads, or about 7,000 times the capacity of this earth, regarded as a sphere in space! Since the bulk of the condensers involved in the above huge total was in all probability absorbed by the telephone industry, it may be of general interest to give a short description of their use and applications in that branch of electrical engineering.

The functions of the telephone condenser may be classified roughly as follows:—

(1) As a convenient switchboard and instrument adjunct for differentiating between variable and continuous current.

(2) To improve transmission by the well-known quality of capacity for annulling inductance, and extending the range of current changes in speaking circuits.

(3) To absorb fluctuations in power leads, which would otherwise cause disturbances.

(4) For various purposes, such as the control of sparking at break contacts, the construction of artificial lines, and, perhaps, as a matter of scientific interest (for, except in the very early days, no commercial instrument seems to have been attempted) as a telephone receiver.

The standard unit in most modern exchange systems on the central energy principle is the 2-microfarad condenser; a variation from this figure of 10 per cent. either way when measured both by discharge deflection, and alternate current at 800 periods per sec. being allowed in the specification of the National Telephone Company. The company is at the present time making extensive use of two patterns of 2 m.f. condensers; a flat type, measuring over all 8 in. by $4\frac{11}{16}$ in. by $\frac{11}{16}$ in., and latterly a square form, $4\frac{13}{32}$ in. by $1\frac{3}{4}$ in. by $1\frac{5}{8}$ in. Both are metal-cased and conform to the same requirements in the matter of capacity, deviation, and breakdown voltage, though a somewhat lower dielectric resistance is permitted in the square pattern by reason of its smaller cubical content. Other things being equal, the advantage, of course, lies with the less bulky condenser, because of the larger number which can be accommodated in the limited space of a telephone switchboard or apparatus room. Fig. 1 is a drawing of one of the typical iron racks which are employed in common battery exchanges for mounting condensers and other apparatus. In this figure each shelf holds 350 condensers of the flat pattern, and the exchange to which the frame belongs (London Wall) makes use of a total of something like 3,300 for all purposes.

Turning now to the function and use of the 2 m.f. condenser. Probably one of the most important instances which can be quoted is that afforded by the common battery instrument of the Western Electric Company, in which the condenser forms an integral part. The principle of this instrument will no doubt be quite familiar to most people concerned with telephony, and a brief description of the action of the transmitter should therefore suffice. Referring to Fig. 2*a*, consider the microphone M to be in a state of rest with current flowing round the circuit from the + to − poles of the exchange battery. Between the points V_2 and V_1, there will be a certain P.D., and condenser will be charged as indicated by the + and − signs. If now the microphone resistance falls owing to the influence of sound waves impinging on the diaphragm, there is a drop in the P.D. $V_2 - V_1$, and consequently a

Digitized by Google

discharge from the condenser round the local winding of the induction coil. This coil is so connected that the discharge induces a secondary E.M.F. in the line coil in the same sense as the main line current, and therefore augments it. When the microphone resistance rises again, the condenser recharges, and this time there is induced an opposing E.M.F. in the line winding which tends still further to reduce the main current. The condenser therefore widens the range of the transmitter action, and adds largely to its efficiency, a very necessary provision in a system wherein the actuating battery is removed to a distant point. If absent or faulty, there is a considerable depreciation both in volume and quality of transmission. Another important function of the condenser in this instrument is to open the bell circuit so far as continuous currents are concerned, which would otherwise lead to waste of energy and signalling difficulties. The receiver is also practically removed to a local circuit, and not exposed to possible demagnetisation from the main battery current.

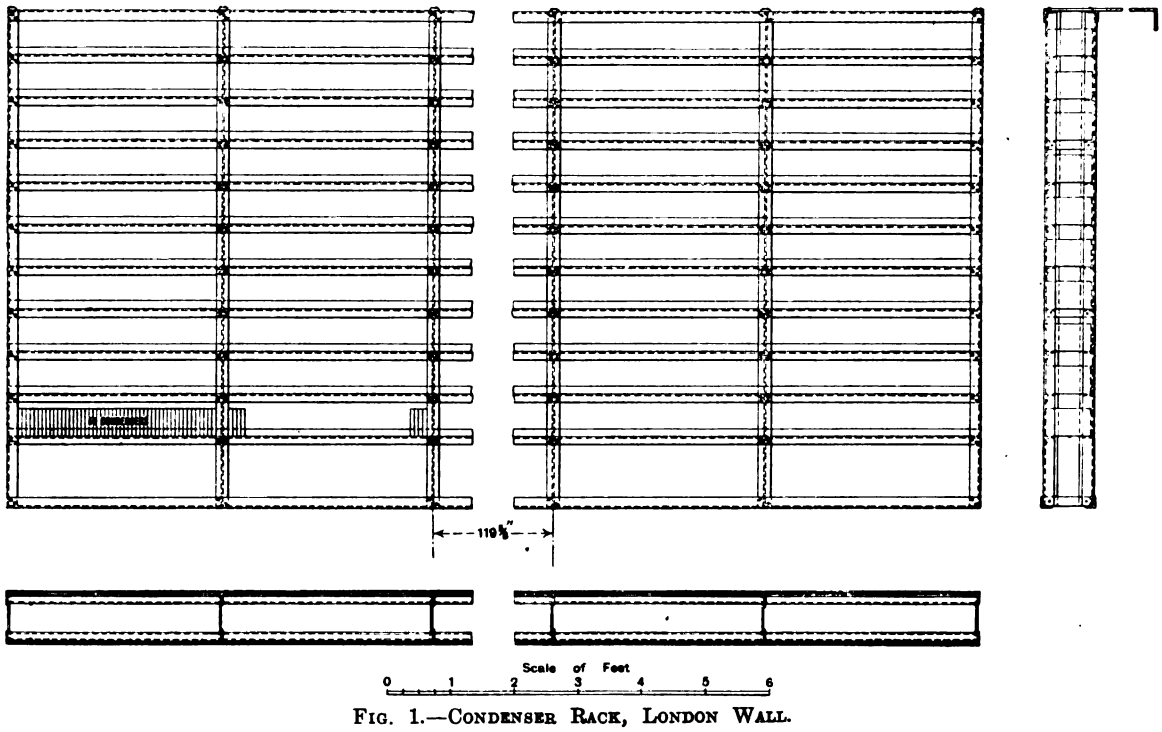

FIG. 1.—CONDENSER RACK, LONDON WALL.

Many telephone users whose exchanges have been converted from local to common battery working, will have noticed the black sandwich-box arrangement which has been fitted in or near their instruments some time prior to the change over, and possibly wondered what it meant. This is the 2 m.f. condenser that must be included in the bell circuit to enable automatic calling and clearing to take effect directly the new exchange equipment comes into operation, and thus to carry on until such time as it may be convenient to instal the complete C.B. type of telephone.

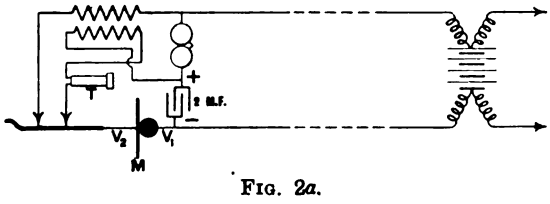

FIG. 2a.

Before leaving the subscriber's instrument, it is worth mentioning that the presence of the 2 m.f. condenser should not sensibly affect the efficiency of the 1,000 ohm magneto bell, although trouble has been experienced with certain older pattern bells actuated by 16-cycle ringing. This is easily rectified by raising the frequency to 20 or 22 cycles per second, when the ringing is, if anything, better with the condenser than without it, owing to the cancellation of inductance. This latter property is used to advantage in some of the selective calling systems introduced in the United States, but not much in favour in this country, as, for instance, the Leich party line, the signalling element of which is shown diagrammatically in Fig. 2b. There are four stations, two of which are responsive to 20 cycle, and the other two to 60 cycle ringing current; the voltages being equal in either case. The bell circuits are tuned by adjusting capacity and inductance so that each station receives maximum current at the particular frequency for which it is designed to work, but so small a current at the other frequency as to be inoperative. The method of doing this will be obvious on inspection of the diagram.

A few typical instances of the utility of condensers in switching circuits will now be dealt with. The majority of these come under heading No. (1) referred to above.

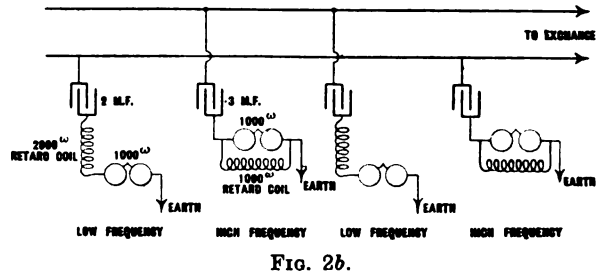

FIG. 2b.

Fig. 3a embodies the essential parts of the subscriber's cord circuit of the most commonly used form of "Stone" or impedance coil C.B. system. The currents required for the transmitters of the two parties in connection pass independently from the battery through retard coils, or relays for supervisory signals, to the two sides of the circuit, which is completed between the feeding points by 2 m.f. condensers. This arrangement ensures that each station receives a working current proportionate to its own circuit resistance,

Digitized by Google

and obviates any trouble due to disparity between the lines connected. The condensers provide a comparatively clear path for undulatory voice currents, and at the same time divide the circuit into two mutually independent sections.

Another typical case is that outlined in Fig. 3*b*. This is a temporary junction circuit between a common battery exchange and an older magneto exchange not yet converted to C.B. The condensers are inserted in both lines to separate the two systems, and so prevent

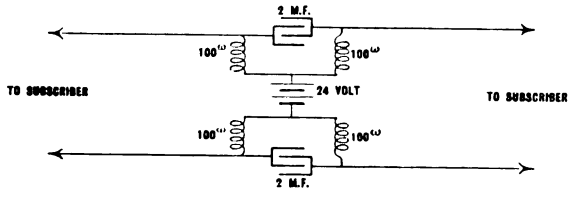

FIG. 3*a*.

complications arising from the central battery current affecting magneto apparatus. This being a ring through circuit, 4 m.f. is required in either leg, to avoid undue cutting down of the ringing, though from the point of view of transmission 2 m.f. condensers would be practically as efficient. It is, of course, a well-known fact in telephony that a very low capacity in series circuit will permit speech currents to pass; indeed, conversation is possible through two or three leaves of foil and paper, and probably only an expert could detect the presence of $\frac{1}{2}$ microfarad.

The standard subscriber's operator's equipment shown in Fig. 4 involves the use of two 2 m.f. condensers which fulfil rather different functions. The condenser in the transmitter circuit designated by *C*, is bridged across the microphone and primary of induction coil in order to provide an easy path for the varying microphone currents, which would otherwise be restricted to the circuit via 165 ohm impedance coil and battery, while that marked C_2 in series with the receiver, besides acting as a barrier to steady current when the listening key is put over, has for its special object the busy test. On tracing the connections it will be seen that normally this condenser is maintained at the potential difference of the central battery. If now the operator touches the bush contact of an engaged line with the tip of the calling plug, the condenser is discharged, and a click in the receiver notifies the condition of the line tested.

Condensers are used on all branch circuits used for electrophone distribution for the purpose of equalising the load on the common music line, and to lessen the

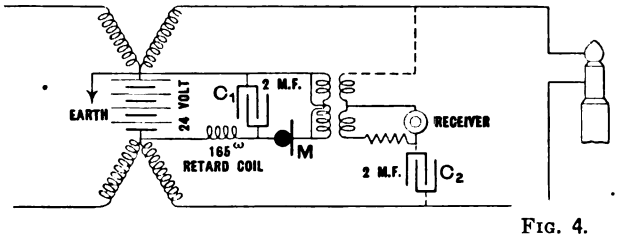

FIG. 4.

chances of breakdown, owing to a fault developing on one of the branches, and there are numerous other applications on common battery, and mixed common and local battery systems, wherein condensers are used as discriminators between steady and fluctuating currents, to enumerate all of which would be an impossible task. The foregoing should, however, give some idea of the contingencies met with in modern switchboard practice.

A very common use to which a condenser is put is that of a shunt to a relay or similar apparatus placed in the line circuit for supervisory work, which would introduce an objectionable amount of impedance to voice currents. As a general rule this device is all right and answers requirements, but it is interesting to note that cases have come to light in which the capacity shunt proved a doubtful advantage. As is

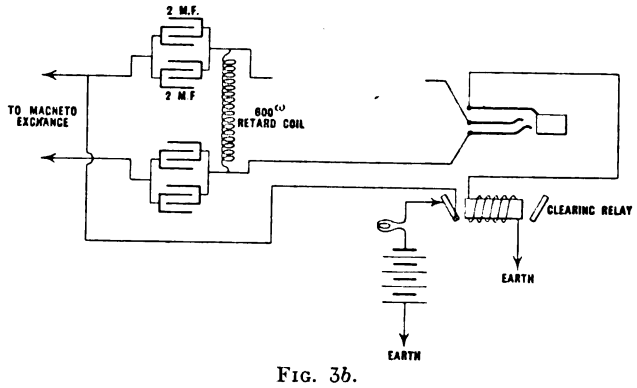

FIG. 3*b*.

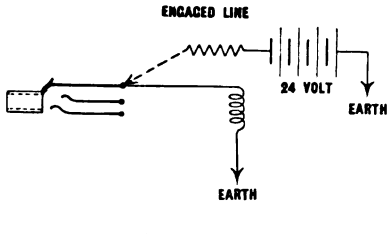
well known, a pure capacity and a pure inductance in parallel will, at resonating frequency, behave like a perfect insulation to the external circuit, and although pure inductances are things which can hardly even be approximated to in the apparatus ordinarily employed in telephony, it is nevertheless possible for the combination in question, say, a relay and 2 m.f. condenser, to offer an impedance to currents of average speech frequency of perhaps several times that of the relay alone. It is well to bear this fact in mind in the design of circuits.

Referring now to the third heading, viz., the absorption of disturbances in power leads. It is usual to supply the power necessary for small private branch exchanges, over one or more pairs of line wires from the battery of a main exchange in the vicinity. Such a common lead would, from its nature, be very liable to give rise to cross talk between local sub-station circuits in use simultaneously, and this tendency is counteracted more or less completely by placing a fairly large capacity across the private exchange current 'bus-bars. A large condenser of 10 m.f. is made up especially for this purpose. Occasionally, too, it is found that the charging machine at the central office, particularly if not of the design adapted to telephonic work, introduces a serious amount of commutator disturbance when running on the accumulators feeding the switchboards. This noise can be considerably reduced, if not removed, by connecting a capacity of, say, 20 m.f. across the dynamo brushes in addition to



the choking coil, which is almost always placed between machine and battery.

In this same category one might include lines used for simultaneous telegraphy and telephony. So far as the writer is aware, not much is done in this direction in Great Britain, but a form of composite circuit used by the American Telegraph & Telephone Company is depicted in Fig. 5.*

This is a method of superposing two complete Morse telegraph systems upon a single loop telephone circuit.

* See also *American Telephone Journal*, June 24, 1905.

Digitized by Google

The principles involved are broadly those developed by Cailbro and Van Rysselberghe. The sudden rise and fall of the sounder currents are checked and rounded off by the 6 m.f. condensers and double coil retards, R_1, R_2, &c., the latter acting differentially to slow impulses, but presenting considerable choking effect to the high frequency telephone currents. Further, any telegraph impulses which pass the 4 m.f. condensers are shunted to earth via the 30-ohm retard coils. On the other hand, speech currents are practically confined to the speaking circuit through the 2 m.f. condensers and spring jacks by reason of the strong choking of the 30-ohm and 50-ohm retardation coils. It is said that this composite circuit, when in good order, is quite satisfactory when all three components are working together, there being no appreciable mutual interference.

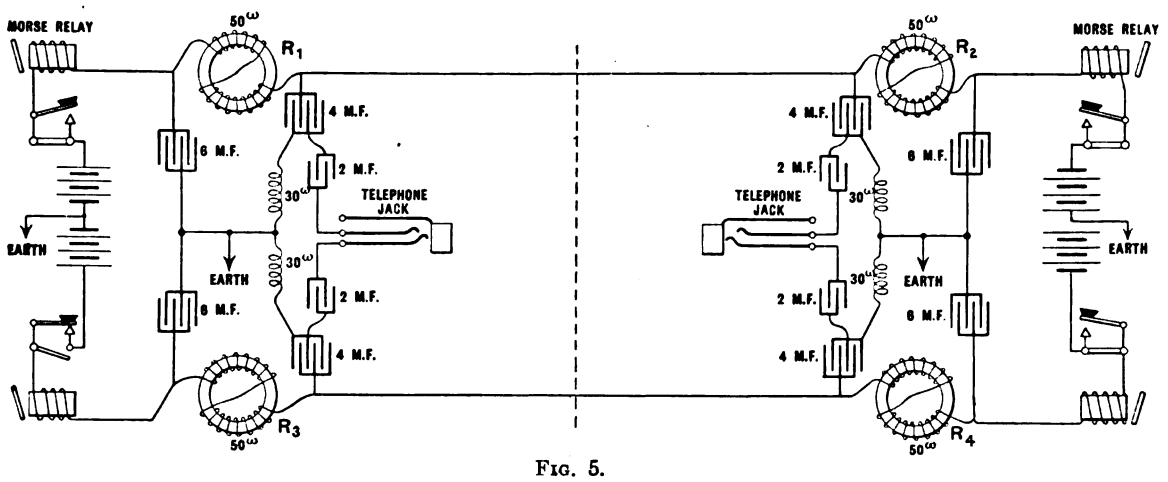


FIG. 5.

As regards miscellaneous applications, the prevention of sparking at vibrating contacts scarcely needs comment. Most exchanges possess some apparatus of the buzzer type with which one or more standard condensers are thus associated. Artificial cables, representing in particular 40 to 50 miles of 20 lb. standard dry-core cable covering the commercial limit of speech, are now becoming an indispensable item in test department equipment. It has been found that these cables can very well be constructed by arranging non-inductively wound resistance spools equal in resistance to one or even two miles of the real 20 lb. cable conductor, in series, with paper condensers of the ordinary type in bridge, having capacities approximating to one or two miles measured wire to wire, say, 0·054 m.f. or 0·108 m.f. as the case may be. Such a piece of apparatus having suitable section terminals and connectors can be built up for a very reasonable figure, and is of great value in all investigations relating to transmission.

As a conclusion to this brief account of the duties assigned to the telephone condenser, a word or two respecting the condenser receiver may be of interest. This is by no means a novelty, for early investigators succeeded in transmitting and receiving speech by utilising the electrostatic principle of varying the capacity of a system of flexible plates forming, or attached to, an acoustic diaphragm. The results obtained, however, though excellent as regards quality, were far too deficient in power to be of use commercially. This deficiency can be remedied by strongly polarising the coatings from a source of constant potential at several hundred volts, and it is surprising what an energetic and clear speaking receiver a loosely built foil condenser makes, if actuated in this manner. It seems not altogether improbable that important developments will take place in this direction in the future.

A NEW SYSTEM OF RAILWAY SIGNALLING

AN interesting Paper embodying some suggestions for removing certain defects of the railway signalling systems already in use was read before the Leeds Local Section of the Institution of Electrical Engineers by Capt. A. Gardiner, on Wednesday of last week. The author pointed out how in various cases a tendency was being shown to avoid reliance entirely on the driver's interpretation of external visual signals. As examples of this he mentioned the "train stop" of the London Underground Railways and the cab signalling system used on a branch of the Great Western Railway to replace distant signals (see ELECTRICAL ENGINEERING, Vol. I., page 431). It is pointed out, however, that a mixed system of signalling, with the "distant" in the cab and the "home" on the track, contains, moreover, a new element of danger, for the "distant" is not a final signal. Even though the "home" be off when the "distant" is passed, the signalman has the option of throwing it to "danger" before its post is reached by the train, and may thus possibly avert an accident. This danger appears to have been recognised by the North-Eastern Railway, and in their system they seek for something more than the single indication, and instal a series of signalling points, each of which confirms, or may cancel, the indication previously given (see ELECTRICAL ENGINEERING, Vol. II., p. 955).

A disadvantage of this system, however, is the use of a "gravity" safety position, as the signal is operated by a magnet that is "dead" for the safety position, and requires to be excited in order to show danger.

Another respect in which our present system of external signals breaks down is as regards reductions of speed. With signals on the cab, not only is it possible to give a "reduce speed" indication that cannot be confounded with any of the other indications, but it becomes possible also to make that signal act directly on the motive power of the engine, and so enforce compliance; and further, by providing for the automatic removal as well as the automatic exhibition of the signal, it becomes possible to obtain a record from which the actual speed over the restricted section can be indisputably established.

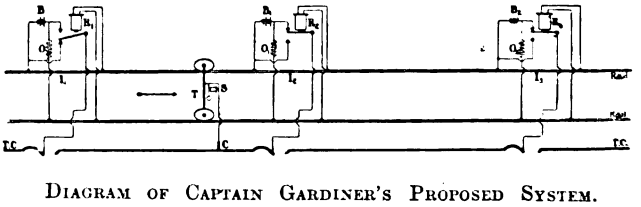

DIAGRAM OF CAPTAIN GARDINER'S PROPOSED SYSTEM.

The method proposed by the author involves the eventual entire abolition of the semaphore and its lamp. Parallel to the running rails is laid a metallic "track conductor" (T.C.).

The track is split up into track circuit sections of the desired

Digitized by Google

length (insulated joints I_1 I_2), and the rails within the limits of these sections are bonded together on each side by one of the usual track circuit wire bonds. At one end of each section is a track relay (R_1 R_2), and at the other a track battery (B B_1) or other source of power for the track relay. The relay and the source of power are each connected to the rails in such a way that when no train is on the section the relay is excited and its armature drawn up; when a train enters the section the relay is short circuited by its wheels and axles and the armature falls away. The armature of the relay carries certain contacts which are closed when the armature is attracted, and for the purpose of this signal it carries also other contacts which will be closed when the armature falls away. A resistance (O_1 O_2) is inserted between the track battery and the track to prevent the battery itself being short circuited by the trains; and a parallel circuit is then taken from the battery positive through the contacts of the near track relay to the track conductor. The track conductor in each section is thus, when the relay controlled by the section ahead is energised, charged with the potential of the track battery above the negative track rail; but is dead when that relay is shunted. Consequently when any track circuit section is occupied, the track conductor of the track circuit section in rear is dead. As far as the first and principal indication to be given on the engine is concerned therefore, viz., "clear" and "stop," all that is required is some means of collecting current from the track conductor, and an electromagnet that will when energised show a "clear" signal, and when de-energised show a "stop" signal by the action of gravity. The action will then be as follows:—If the section (B_2 R_2) ahead of a train is clear, its relay R_2 will be energised. The battery B_1 will have part of its current shunted through the fixed resistance (O_1) and the wheels and axles of the train (T), while part of the current will pass *viâ* the track conductor and the collecting devices on the engine, and *viâ* the coils of the signal magnet (5) to the negative rail. The train will thus receive the "clear" signal. Should, on the other hand, the section ahead be occupied (as is the section B_1 R_1) the relay (R_1) being de-energised, the track conductor will be dead, and a following train will receive the "stop" signal. The lower contact of the relay is arranged to connect the track conductor directly to the negative rail of the section so that in the de-energised position of the relay it will be impossible for there to be sufficient difference of potential between them to retain the signal armature in the "clear" position.

To control the motion of the train, the armature of the signal magnet is supplied with contacts placed in a local circuit on the engine, which includes electromagnetic valves on the main steam pipe and the train brake pipe; the former to shut off steam, the latter to admit air to a vacuum equipment, or release the air from a Westinghouse one whenever the circuit is opened by the fall of the signal armature. The local circuit on the engine would also, if desired, include a whistle, bell, or buzzer, designed to operate when the signal falls, so as still further to attract the attention of the driver.

The recorder consists of a chart revolved by clock-work under a pen which is controlled by an electromagnet placed in a circuit of the local battery on the engine, and arranged so as to mark the chart when the signal magnet is in the released or "stop" position.

A train following the train "T," and approaching from the left, will be perfectly safe up to the insulated joint I_1; should it pass I_1, its collector and its signal magnet will be in parallel with the collector "C" and signal magnet "S" of train "T." To prevent this it is proposed to make use of a ramp to open the signal circuit of the following train. The track conductor is ramped in the neighbourhood of, and to the facing side of, each insulated joint. The cab signal has an additional "danger" magnet which controls three contacts, one for its own local circuit, one in series with the collector and the signal magnet, and one to operate an audible signal. Further, when de-energised it causes a shutter marked "danger" to drop by gravity in front of the signal window. The danger magnet is normally excited by the local battery on the engine, the circuit being through its coils and its own contacts in series.

One collector on each side of the engine is so arranged as to be normally insulated from this circuit, but when the collector is raised by means of a ramp it breaks the local circuit and substitutes for it another circuit from the ramp through the collector and the coils of the danger magnet to earth. If, however, the substituted circuit is dead, the armature of the danger magnet falls away on the opening of the local circuit, and in doing so breaks that circuit a second time at its own contacts. The local battery is consequently unable to resume control of the magnet after the engine has quitted the ramp. But the circuit of the signal magnet is also taken through the contacts of the danger magnet; and consequently the fact of the track conductor being alive beyond I does not result in a "clear" signal. The train would thus traverse the section I_1 I_2 (which is either occupied in some way or else unsignalled in consequence of a breakdown of its equipment, and which is therefore in either case an extremely dangerous zone) with the "danger" signal before the driver. This would be registered on the recorder, and the length of the section being known, the speed at which he traversed it would be indisputably established. If the delay had been due to the relay (R_1) being out of order, the track conductor in the section I_1 I_2 will have been alive.

Before leaving that section the engine must traverse its danger ramp, which is, however, this time a live one. The auxiliary circuit to earth which is made temporarily by one of the collecting shoes while on a ramp will now energise the danger magnet and close its contacts, enabling the local battery to resume control as the engine leaves the ramp and closing the circuit of the signal magnet. This is the normal action when quitting each "clear" section, the driver then requiring no notice whatever.

The above indications deal with the track between stations. We may now consider the approach to a station. The train may run in or through on the straight, or it may have to be turned off on to a siding or branch. In the latter case the driver should approach with reduced speed since it is not safe for him to take points for a turn-out at the same speed as for the straight. To give the warning to reduce speed, an independent ramp is placed (if the track conductor is outside) between the rails of the track. An additional magnet is supplied to the engine equipment and an additional contact device for the "reduce speed" ramp. The magnet works on the same principle as the "danger" magnet, but it is proposed that it should merely shut off steam and not affect the brake; this is, however, entirely a matter of what may be desired. The "reduce speed" magnet has a suitably worded shutter which appears by the action of gravity at a separate window placed as close as possible under that at which the "stop," "clear," and "danger" signals are shown. When the magnet is excited the "reduce speed" shutter is drawn up and the window is blank. The ramp circuit is dependent upon the points, and when these are set for the straight and all is clear, the "reduce speed" shutter will not drop; when set for a turn-out the driver will receive his warning, and with the aid of the recorder it will be possible to determine what action he took upon it.

It is, however, possibly further necessary to advise the driver of the actual route set for his train. With certain limits this can readily be done by means of bars on the track which will be normally dead, but one or other of which will be charged with current according to the setting of the points. The engine will carry a set of contact springs or other device and an indicator which will show the number of the ramp which is charged with current. The indication will not be a primary signal, and the absence of any indication can be treated as a "dead end" signal.

As regards the safety of such a system of signals as here advocated, the essential signal of the equipment is that which gives the indication "clear" and "stop." The "stop" signal is entirely a normal mechanical signal, and has to be held off continuously by a current received from the track conductor under the control of the track relay. Consequently even if the conductor be carried away altogether, the only result can be to stop the train.

As regards cost, a primary signalling equipment consisting of "clear," "stop," "danger," and "reduce speed" indicators, with the necessary contacts, &c., could probably be fitted, at a rough estimate, for about £20 per engine, which at 0·4 of an engine per mile, the figure for the Eastern Bengal State Railway, works out to £8 a mile. Fully equipped with train control as proposed in this Paper the cost would, of course, exceed this figure, but it is believed that the track work between stations with half-mile sections (instead of 1 mile as with the semaphore), need not exceed from about £140 to £160 per mile, and the engine equipments to from £40 to £50.

DISCUSSION.

Following the reading of the Paper, Captain Gardiner illustrated the working of his system by means of a complete model railway track and the actual apparatus used in a locomotive cab.

The discussion was entirely confined to experts on the subject, there being present a considerable number of representatives from the leading railway companies in the country, who had armed themselves with sheaves of written criticisms. While generally eulogising Captain Gardiner on the ingenuity and completeness of his system, there was naturally considerable technical criticism of the details which form such a radical

Digitized by Google

departure from present-day methods. The general opinion was distinctly against the complete abolition of the semaphore, preference being given to retaining the "home" signal, but the "distant" semaphore, which is expensive to maintain, and liable to get out of order, might with advantage be replaced by a track signal with cab indication. The entire adoption of automatic track signalling would tend to make the driver a mere automaton, and the numerous electrical contacts and mechanical adjustments on the track would be difficult to maintain in efficient working order.

"DOUBLE DECK" STEAM TURBINE POWER PLANTS

IN a Paper read by Mr. J. R. Bibbins before the American Institute of Electrical Engineers at their annual summer meeting this year, a new design for electric generating stations was dealt with. There are now in service three important examples of this new type—the "double-deck" station. This type of station embodies striking originality in its departure from long-established practice, and is particularly suitable for power sites of restricted area.

At the outset it will be well briefly to review the most characteristic features of the station known as the West Point Station, before proceeding with a discussion of the double-decked type in general. The chief feature of this station is that the generating machinery is above the boilers on the second floor of the station; and the weight of the generating apparatus is supported entirely by the steel building skeleton. A section drawing of this station is given in the figure below.

The following other features are of interest:—(1) Barometric condenser hung from floor girders directly under turbine exhaust nozzle. Designed for moderate vacuum; no air pumps; adjustable cones; centrifugal type circulating pump. (2) Steam piping simple and direct with few bends, draining back from turbine throttle; no superheat; separators in each supply line to turbines. (3) All important steam header and supply lines controlled by pedestal extension valves from turbine floor; non-return valves in delivery from each boiler to prevent back-flow. (4) Header serves largely as equaliser, hence small in size (8 in.); sectioned by valves; operates practically on the unit system. (5) Designed for 200 lb. pressure, high steam velocities; largest steam pipe in plant 8 in., hung from girders. (6) All auxiliaries steam-driven for feed heating; open type heater; feed taken from condenser hot well. (7) Two-storey side addition accommodating transformers; switchgear and protective apparatus above; heaters and auxiliaries below; also serves as transmission tower. (8) Operating switchboard located in division wall, leaving a clear rectangular operating room, and separate switch room. (9) Generators air-cooled by positive blast piped from outside to reach cooler air and to avoid the possibility of steam from boiler room reaching insulation. (10) Turbine bedplate levelled on plate girders throughout its length with cast lead pad 1 in. thick. (11) Reserve exciter unit, steam-driven, exhaust to heater. (12) Transformers mounted on trucks to facilitate replacement by reserve unit provided. (13) Flue connections direct to stack; no bends. (14) Self-supporting, brick lined, steel stack.

The station was designed to serve interurban railway lines through alternating current sub-stations, and its position is reasonably near the ultimate centre of the system. It is but a short distance from some coal mines owned by the company, and the site chosen, at the foot of a hill, permits the use of the waters of two passing streams for condensing purposes. With this site, coal-handling machinery was avoided and barometric condensers used.

The Author explains his reasons for advocating this design as follows:—As compactness is perhaps the controlling feature, it is interesting to note that the problem now lies not with the generating, but with the boiler plant. Familiar Corliss engine practice of a decade ago, involving parallel engine and boiler rooms of about equal size, has been superseded by a ratio of one to three, or more, in turbine plants, especially if the boilers be double-decked, as in the large New York plants. It might, then, seem unwise to return to a station arrangement of equal area, as in the two-storey building; but it will be found that other advantages accruing in the direction of cost and simplicity render this arrangement most effective, especially as the extra space in the turbine floor is usually occupied by direct-current converting apparatus serving near-by sections of line. For several years there has been a continual reduction in the bulk and cost of the turbine unit. To what extent, can best be appreciated by comparison with Corliss practice.

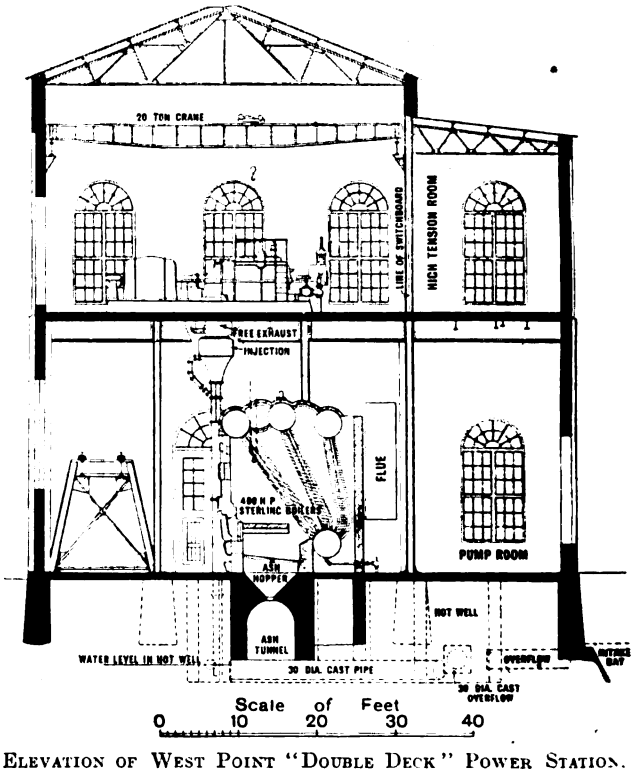
Type of prime mover.	Over-all floor space, square feet per electrical horse-power.
Horizontal Corliss, 500 to 1,500 e.h.p.	0·7 to 1
Vertical Corliss, 1,000 to 3,500 e.h.p.	0·35 to 0·4
Horizontal vertical compound Corliss, 7,000 e.h.p.	0·46
Vertical 3-cyl. Corliss 5,000 e.h.p.	0·2
Single-flow turbine, 1,000 to 5,000 e.h.p.	0·17 to 0·75
Double-flow turbine, 15,000 e.h.p.	0·05

Thus, in large sizes, the turbine has reduced floor areas to about 20 per cent. of that required by the modern vertical Corliss engine, and to about 10 per cent. of the horizontal vertical type. A detailed comparison between single-flow and double-flow types follows:—

Unit size. kw.	Type.	Floor space required in sq. ft. per kw.	per e.h.p.
1,000	Single-flow	0·200	0·149
1,500	,,	0·165	0·123
2,000	,,	0·141	0·105
3,000	,,	0·101	0·075
5,000	Double-flow	0·092	0·068
10,000	,,	0·063	0·047

Similarly in weight per kilowatt capacity. Data are not at hand for comparison with complete reciprocating units, but without generators, large vertical Corliss engines, including fly-wheel, weigh from 320 to 500 lb. per kilowatt, the weight increasing with the size, whereas the large turbine unit complete weighs but a fraction, 15 to 20 per cent. of the above, and, moreover, the weight decreases with the size. Considering in addition that the horizontal turbine permits the installation of auxiliaries beneath, this extreme compactness practically eliminates it in the study of reduced floor area. The West Point station covers a floor area of two square feet per kilowatt. Considering the small size, this represents a high degree of compactness, relatively better than in some large turbine stations. The Ft. Wayne double-deck station covers 1·42 square feet per kilowatt, ground floor plan, the second New York Edison Waterside 0·818, and the Boston Edison 2·64; and these latter have twenty to twenty-five times the capacity.

The Paper continues:—In spite of the relatively high speed, the construction of turbine machinery has been brought to such a state of perfection that structural foundations are permissible



ELEVATION OF WEST POINT "DOUBLE DECK" POWER STATION.

in certain types, which at once open up an extensive field for originality in the arrangement of units and auxiliaries. For example, 1,000-kw. units in a power house at Piedmont, W. Va., are supported entirely upon 8-in. cast iron pipe columns with units spaced 10-ft. centres, and all auxiliaries beneath. In a power house in Philadelphia, reinforced concrete posts tied into the concrete floor structure carry the entire weight of the generating plant. As the height of these columns is 20 feet or

Digitized by Google

more, it is but a step further to employ standard column sections and elevate the machines to a height sufficient to place the boilers beneath. This has been done in the three stations already referred to. At Fort Wayne the turbine floor stands 28·5 ft., and at West Point 33 ft. above the boiler room on ground floor, by no means an excessive height. Here seems to be one of the most advantageous features of the horizontal type turbine—foundation loadings sufficiently distributed to permit of a light foundation structure involving preferably, but two principal points of support. It might, of course, be possible to provide a supporting column under each of the three bearings; but with the possibility of unequal settling at the footings and temperature changes resulting from the proximity to boiler settings, it is evidently a much simpler solution of the problem to employ two points of support. At West Point only 12-in. box columns are required. Of course, it is impossible entirely to concentrate the weight of the unit on these columns. A certain proportion must be carried by the building walls. It is therefore desirable to employ a steel skeleton building, carrying the machine crane and roof truss loadings independently of the brick wall. This evidently simplifies to a large degree the problem of maintaining proper turbine alignment. Although strictly necessary only for the turbine supporting structure, the steel work may be extended upward to relieve the wall loading, with little, if any, increase in cost over that of heavier building wall otherwise necessary. At West Point, the longitudinal members between the turbines are tied together into a continuous floor structure from wall to wall, with the sole object of reinforcement, resulting in an exceedingly rigid structure integral with the building skeleton, which has proved to be entirely devoid of any vibration. This applies also to the steel supporting columns, which show no evidences of vibration.

The West Point station is an excellent example of the possibilities of a compact condensing plant. The barometric condensers are attached directly to the turbine exhaust. Here the condensers are arranged in line with the boiler fronts, but with a passage of over 6 ft. between boiler settings, it is quite evident that the condenser may be placed wherever most convenient, irrespective of the position of the batteries, and with a discharge tunnel conveniently located.

In the double-deck station it is important to draw ventilating air from the outside to avoid not only the heat above the boilers, but also the possibility of escaping steam reaching the generator insulation. Some little difficulty here arises in avoiding structural work, but hardly to any greater degree than in the ordinary station. At West Point one vertical and one horizontal offset to the ventilating ducts suffice to clear both columns and girders. At Fort Wayne a rectangular steel duct extends from one end of the building to the other in front of the boilers, drawing air from either end, according to the prevailing winds. Each generator then draws from this air header through comparatively short and direct connections. An auxiliary steam-driven blower in the adjoining area way has also been installed to assist in delivering more air to the generators during very hot weather and peak loads. With this provision against excessive temperature rises in the generators, even under the worst conditions of atmosphere and load, there follows the maximum security against interruptions and the possibility of tiding over emergencies.

The avoidance of long runs and bends in steam piping is, of course, fully as important, if not more so, than in exhaust piping, and with boilers beneath turbines a most simple and desirable arrangement is possible. In the Fort Wayne station the steam has but 30 to 35 ft. to travel between any turbine throttle and the boilers supplying this particular machine, and with only two long-sweep bends intervening. Moreover, piping may be most readily drained—a point of value, even with superheat. At Fort Wayne, there is a continuous slope to the boilers. At West Point, where no superheaters are used, the header is drained by steam traps, separators being provided in each turbine line as an additional precaution. Under normal working conditions, therefore, the plant operates almost entirely on the unit system, with the interconnected header properly sectioned to isolate trouble in emergencies. In both stations each turbine line connects to the header close to the feeders from the boilers supplying it, so that the header operates simply as an equaliser between the various points of demand.

There is an excellent building arrangement at West Point to provide for switch room and auxiliaries. An addition to the rear of the main building accommodates the electrical apparatus above, and the feed pumps, circulating pumps, and heater below. This addition provides a rectangular engine and boiler room of minimum proportions, with centralised auxiliary and electrical control plants, permitting the installation of the switchboard in a most convenient position between the building columns, with all the high-tension apparatus in the rear, including high-tension bus-bars, circuit-breakers, and protective apparatus with transmission line outlets near the roof. In the 33 ft. between floors, there is space for a mezzanine floor or gallery for some of the small auxiliaries, but this has not been made use of at West Point.

THE POWER REQUIREMENTS OF MACHINE TOOLS FOR RAILWAY SHOPS

AN abstract of an appendix to a Paper on "High-Speed Tool Steel" read by Mr. L. R. Pomeroy before the Central Railway Club of Buffalo, U.S.A., is given in a recent issue of the *Railway Gazette*. This abstract, which deals with the horse-power required to drive the various machine tools in railway shops, is of considerable interest, and is reproduced in full below.

Generally speaking, for railroad repair shops, the generator capacity approximately equals 15 kw. per locomotive pit, or space in erecting shop occupied by one locomotive. This comprehends requirements for tools, cranes, heating, blower and exhaust fans, and thus provides for all power required except lighting. The tools alone require about 9 to 10 kw. per pit; heating, blower and exhaust fans 5 kw. per pit, while 3 kw. per pit will suffice for the ordinary shop and adjacent yard lighting.

The following curves, Figs. 1 to 8, are submitted to cover the general horse-power requirements of machine tools ordinarily found in railroad repair shops. Occasionally certain tools are selected with the purpose of performing extra heavy service, to utilise the full capacity of the new rapid cutting tool steel, as is now done in manufacturing shops; in such cases the power to drive must be figured on the basis of service required of the machine. As these cases are few and exceptional the curves meet the majority of conditions, but the exceptions can be taken care of by the following formula :—

Horse-power to drive equals $F \times D \times S \times 12 \times N \times C$., where

F = Feed in inches.
D = Depth of cut in inches.
S = Feet per minute.
N = Number of tools cutting.
C = A constant depending on the class of material, with the following values :

For cast iron	0·35 to 0·5
Soft steel or wrought iron	0·45 to 0·7
Loc. driving-wheel tires	0·70 to 1·00
Crucible steel driving-wheel tires	1·00 to 1·10.

This formula is based on Prof. Flather's dynamometer tests, which compare favourably with actual motor tests, and is, therefore, submitted with confidence. For example : The aggregate horse-power of 45 tests, with various tools, by test was 247·7, while the calculated aggregate horse-power by formula equalled 247·2. The extensive tests made by Dr. Nicolson, of the Manchester Technical School, confirm the foregoing, and form a very interesting contribution to the subject. A careful analysis of the results of these experiments shows the average horse-power required at the motor, per pound of metal removed per minute to be as follows :—

Medium or soft steel or wrought iron	2·4 h.p.
Hard steel	2·65 h.p.
Cast iron, soft or medium	1·00 h.p.
Cast iron, hard	1·36 h.p.

Using the symbols of the previous formula, the horse-power becomes : $F \times D \times S \times 12 \times N \times W \times$ constants above, where W equals the weight of a cubic inch of metal removed and is as follows : For cast iron 0·258; wrought iron 0·278; for steel 0·284.

The following examples illustrate the more or less heavy cuts to which reference has been made; the larger powers given

Digitized by Google

are exceptional, while the average requirements are far below these, and all are submitted as actual cases which have come under the writer's observation :—

(*a*)—100 in. driving wheel lathe—(material steel d.w. tires).
$\frac{5}{16}$ in. feed ($\frac{5}{16}$ in. cut) at 18·5 ft.p.m. (two tools cutting).
$\frac{5}{16}$ in. × $\frac{5}{16}$ in. × 18·5 ft. × 12 × 2 × C. = 40 h.p.
Same lathe $\frac{3}{16}$ in. feed ($\frac{1}{4}$ in. cut) at 16 ft.p.m. (two tools cutting).
$\frac{3}{16}$ in. × $\frac{1}{4}$ in. × 16 ft. × 12 × 2 × C. = 16 h.p.

(*b*)—Old 76 in. driving wheel lathe (material d.w. tires).
$\frac{1}{16}$ in. × $\frac{1}{4}$ in. × 16 ft. × 12 × 2 × C. = 5 h.p.

Average feed 0·4625 in. × depth 0·423 at 12·2 ft. p.m. (two tools cutting).

The foregoing figures are the averages of 37 tests and represent 40 h.p. The maximum horse-power developed was about 65. The machine is equipped with a 40 h.p., d.c. motor with a 2 to 1 speed variation.

The lathe in question is a "special," extra heavy, and about double the capacity and cost of the standard driving wheel lathe of equivalent size. On average work the same investment in two lathes will turn out more work in a year than this special machine.

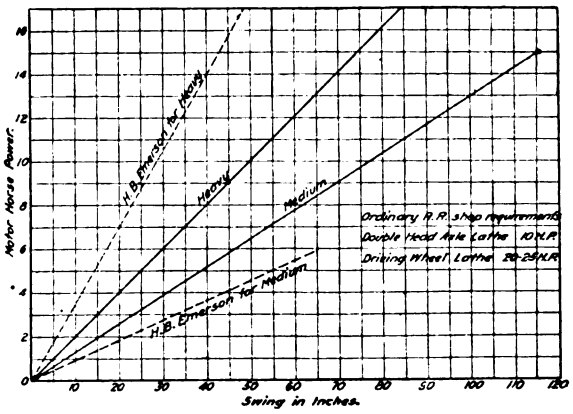


Fig. 1.—*Lathe Motors.*

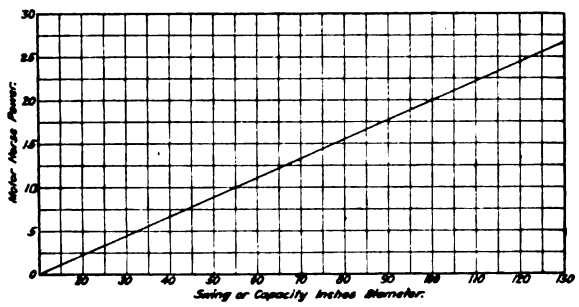

Fig. 5.—*Boring Mills.*

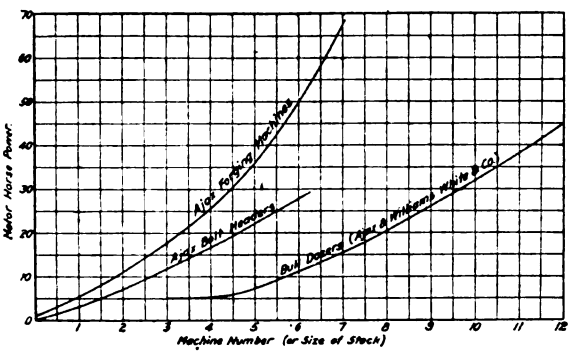

Fig. 7.—*Forging and Bolt Heading Machines.*

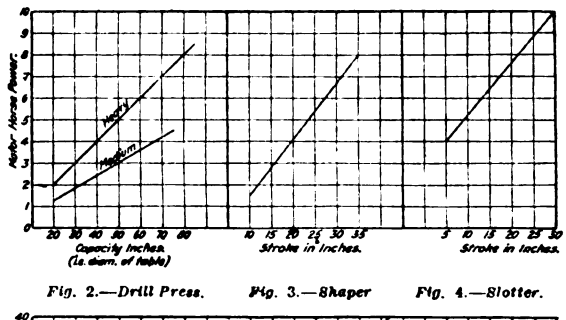

Fig. 2.—*Drill Press.* Fig. 3.—*Shaper* Fig. 4.—*Slotter.*

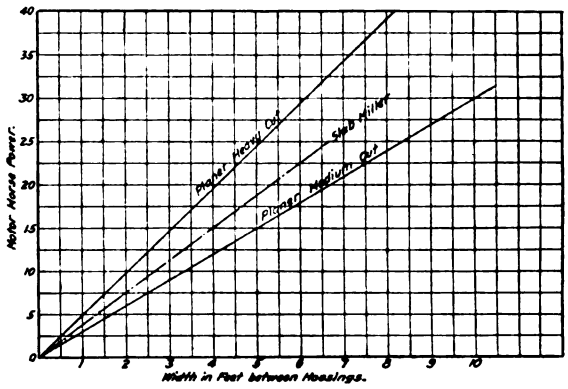

Fig. 6.—*Planers.*

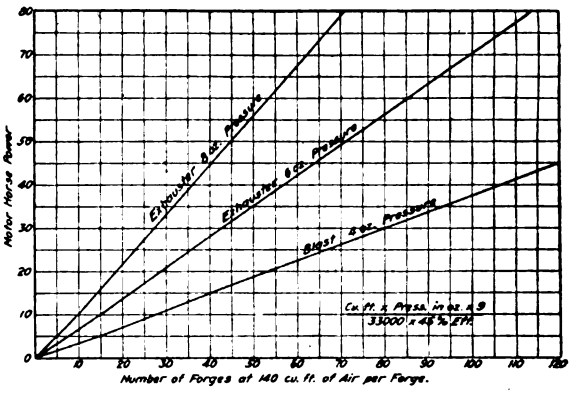

Fig. 8.—*Fans.*

FIGS. 1–8.—HORSE-POWER OF MOTORS REQUIRED BY VARIOUS MACHINE TOOLS.

(*c*)—Steel tired wheel lathe (engine truck wheels).
$\frac{1}{4}$ in. × $\frac{5}{16}$ in. × 16 ft. × 12 × 2 × C. = 17 h.p.

(*d*)—Planer (material cast iron).
$\frac{5}{32}$ in. × $\frac{3}{8}$ in. × 16 ft. × 12 × 0·35 (one tool cutting) = 4·5 h.p. (two tools cutting) = 9 h.p.

(*e*)—Planer (wrought iron engine frame).
$\frac{5}{32}$ in. × $\frac{1}{2}$ in. × 16 ft. × 12 × 2 × 0·5 (two tools cutting) = 15 h.p.

(*f*)—76 in. boring mill (on cast steel d.w. centres).
$\frac{1}{8}$ in. × $\frac{3}{4}$ in. × 30 ft. × 12 × 3 × 45 (two tools cutting) = 45 h.p.
Same machine boring driving wheel tire.
$\frac{1}{8}$ in. × $\frac{5}{16}$ in. × 28 ft. × 12 × 2 × 1 (two tools cutting) = 15 h.p.

(*g*)—84 in. boring mill (on 62 in. cast iron wheel centres).
$\frac{1}{8}$ in. × $\frac{1}{16}$ in. × 30 ft. × 12 × 3 × 0·35 (three tools cutting = 4·7 h.p.
Same mill boring 44 in. steel tire.
$\frac{1}{4}$ in. × $\frac{3}{32}$ in. × 26 ft. × 12 × 2 × 1 (two tools cutting) = 14·5 h.p.

(h)—A special test on an extra heavy driving wheel lathe, giving results representing unusual conditions, where the operator was given a heavy bonus to develop the ultimate capacity of the machine, is as follows :

For rapid estimates, where the foregoing data is not available, the horse-power required can be obtained by the following formulæ :—

$$(a) \quad \text{Single belt} \quad \text{h.p.} = \frac{d \text{ in.} \times f \times R}{12 \times 400},$$

where d = diameter of smaller pulley in inches; f = face of pulley in inches, and R = revolutions per minute.

$$(b) \quad \text{Double belt} \quad \text{h.p.} = \frac{d \text{ in.} \times f \times R}{12 \times 400 \times 0{\cdot}7}$$

This formula is very conservative, and provides for about as much overload capacity for belts as is ordinarily assumed for motors; it includes a liberal allowance for the influence of centrifugal force and diminishing arc of contact of the pulley figured, driven from a larger one. It is especially useful in figuring the power required for wood-working machines, and was arrived at largely from experience with such machines.

The tool builders do not always discriminate between the requirements of manufacturing plants and railroad repair shops, and for this reason motors are often recommended that are

Digitized by Google

larger than necessary. For example: the finished product of the axle department of a large concern becomes the raw material for railroad shops. In the former case, the forging is turned out from the hammer without much regard to finished dimensions, as it is much cheaper to rough out to size on special rapid reduction lathes than to attempt to reduce the size under the hammer.

For such machinery high power is required, but for the same lathes in railroad shops, where the work performed is finishing on journals and wheel seats, mainly finishing cuts, a smaller and cheaper motor can be selected. As an example of extreme requirements, the case of a Bement-Niles lathe furnished to a large axle works may be cited. The capacity of this machine is two cuts, each $\frac{3}{8}$ in. by $\frac{1}{8}$ in. at 60 ft. per minute, and at this rate of cutting it requires a 60-h.p. motor. Another machine, built for the same work, but used largely in axle shops and in many railroad shops, is capable of taking two cuts of $\frac{3}{4}$ in. by 1/12 in. at 24 ft. per minute with only 18 h.p., but is usually furnished with a 20 h.p. motor. While this power motor is quite suitable for the full capacity of the machine, a 10 h.p. motor will usually cover the requirements of the same tool on average railroad shop work.

LONDON ELECTRIC POWER BILLS

Proceedings before House of Commons Committee

THE case for the promoters of the London and District Electricity Supply Bill is still being heard by Mr. Luke White's Committee in the House of Commons. In our last issue we dealt with the evidence and cross-examination of Mr. Parshall, joint engineer to the scheme. Mr. Parshall was followed by Mr. Robert Hammond, whose evidence and cross-examination occupied a portion of Wednesday, the whole of Thursday, and a portion of Friday.

On Thursday, a deputation of London and other Liberal members waited upon the Prime Minister in order to call his attention to the resolution passed by the London Liberal Federation last week, to the effect that that body viewed "with profound alarm" the London and District Electricity Supply Bill, and regretted that the Government should have given facilities to it. Among the members of the deputation, which, says *The Times*, was introduced by Mr. Lough (West Islington), were the Rev. G. Hooper, Mr. G. Lambert, Mr. Pickersgill (South Melton, Devon), Mr. T. Davies (Fulham), and Mr. A. J. Mundella. Mr. Asquith was accompanied by Mr. Churchill, Sir Hudson Kearley, Mr. McKinnon Wood, and Mr. J. A. Pease. It is stated that Mr. Churchill pointed out that the Government were not pledged to the principle of this Bill, and that their action hitherto had been guided by the desire that the Bill should be referred to a committee so that it might have fair play. The Board of Trade had no desire to take one side or the other during the later stages of the Bill. In reply to Mr. Pickersgill, Mr. Asquith is understood to have stated that the Government whips would not tell in any divisions that might be taken in the House during the final stages of the Bill, after it has passed the Committee. On Friday last the Board of Trade issued a report recommending reconsideration of certain clauses of the Bill. We give this report in full on p. 618.

London and District Electricity Supply Bill

Mr. ROBERT HAMMOND, who has been responsible for the large mass of statistical information which has been prepared in connection with the Bill, explained the various tables much in the same way, and practically in the same words, that he did before the House of Lords Committee. These statistics, it should be pointed out, were compiled from the accounts for the year ended December 31st, 1906, in the case of the companies, and March 31st, 1907, in the case of the local authorities. The general effect of them is that, in comparison with the maximum prices in the Bill, the quantity of energy which, as shown in these accounts, cost £1,387,989 to produce on the part of all the authorised distributors in the area, could be given by the power company for £747,917, thus showing an annual saving of £640,072. This is on the assumption, of course, that all the existing plant would be scrapped, which, in the words of Mr. Hammond, is not regarded by the promoters as practical politics. It is contended, however, that it would be unsound to perpetuate the present uneconomical state of things by adding to the generating plant in the various generating stations, and that all future supplies could be more economically drawn from a central generating works such as that proposed under the Bill. Following out this line of reasoning, Mr. Hammond has prepared tables showing the advantages to the present authorised distributors if, instead of extending their works, they in future took a bulk supply from the power company. In the case of local authorities an aggregate saving of £112,569 per annum is shown under these conditions, and in the case of the companies £112,027, making a total of £224,596. This, briefly, is the case for the Bill, and Mr. Hammond was put into the witness-box for the purpose of formally proving his figures and then to undergo cross-examination upon them.

Mr. Hammond is always an entertaining witness, and his cross-examination at times was of an enlivening character, owing to the fighting attitude which he assumes in his answers in preference to confining himself to stereotyped answers of "Yes" or "No." In fact, this propensity of Mr. Hammond's on one or two occasions called forth a gentle remonstrance from the Chairman. At the same time, he did not come under the ban of the Chairman for irrelevant answers quite so often as did the opposing counsel for putting irrelevant questions or putting matters of argument to the witness which he was left in a quandary as to whether an answer was expected of him or not. For instance, Mr. Vesey Knox, for a number of authorities outside London, asked if Mr. Hammond had made any calculation as to the probable purchase price in 1931. "No," said Mr. Hammond. "Do you know," continued counsel, "that, taking your estimated balance sheet, and taking 17½, which is the usual multiplier for 30 years' purchase on the 4 per cent. basis, that the purchase price will be £6,382,000?" "No," replied Mr. Hammond. In the same way, Mr. Meyer, for the Battersea Borough Council, asked if witness was aware that the whole saving shown by his tables, in the case of local authorities, would amount to less than a farthing rate." Again the reply was "No." Many other questions of a similar character were put, to which the obvious answer was "No," and when, apparently tired of the continual "No," Mr. Hammond varied the monotony by innocently answering "It is marvellous how these things work out," there was a good deal of laughter. Mr. Morten, for West Ham Corporation, adopted the well-worn argument that the Corporation was supplying at cheaper rates than the power company was proposing, and therefore what benefit could be conferred upon that district; but Mr. Hammond had a ready answer which was appreciated by those who remember the recent Local Government Board proceedings. "Some people," he said, "say you are charging too low prices." Mr. Morten, by the way, was repeatedly pulled up by the Chairman for pursuing the point that if every district in London was as well supplied as West Ham, the power scheme could never come into existence, and therefore the Bill should not be passed. The Chairman said that the committee quite understood, and the witnesses had already agreed to that extent, that if no one took power the company could not supply it. Mr. Morten did not appreciate the interruption, and replied that he would prefer to put his point to the witness if he were allowed time. Some questions more to the point were put by Mr. Vesey Knox on behalf of Southwark. Here the Borough Council, which is supplying on the direct-current system, is in competition with the London Electric Supply Corporation, which supplies alternating current. Under the schedule of prices in the Bill, alternating-current supply is cheaper than direct-current supply; therefore, argued Mr. Vesey Knox, it would be possible for the power company to enter into an agreement with the London Electric Supply Corporation to give a supply of cheap alternating current, and thus competition with the Council could be made more effective. Of course, the argument leaves out of account the fact that the power company would be able to supply both parties, whilst Mr. Hammond's reply on the question of competition was that as the Newington Vestry many years ago permitted the supply company to obtain an order for their district, that was a mistake, the consequences of which the present Council must suffer for. Mr. Vesey Knox also wished Mr. Hammond to bind his proposed company to give a supply to Southwark for a certain amount, but when the Chairman asked if the Council would bind itself to take the supply, counsel replied that that was another question, and the matter immediately dropped. Some amusement was caused when Mr. Meyer, for the Battersea

Digitized by Google

Council, expressed his conviction that he would convert Mr. Hammond from believing that his figures, so far as Battersea was concerned, were right. The Chairman, somewhat incredulously, invited him to try. At the same time, it must be admitted that counsel met with a degree of success not common with the other opposing counsel as a general rule, for he showed that the accounts of the Battersea Council for the year ended March 31st, 1907, included interest and sinking-fund charges until the following September, viz., eighteen months, and Mr. Hammond had dealt with the accounts as for twelve months. As, however, the accounts themselves did not indicate this fact, no blame attaches to the promoters.

During Mr. Hammond's evidence the promoters, by permission, interpolated the evidence of Mr. Oliver Bury, the general manager of the Great Northern Railway Co., who repeated his evidence in the other House as to the company's desire to convert their suburban lines to electric traction, but that they had been deterred owing to the necessity for erecting their own power station, the cost of which represented about 35 per cent. of the total cost of the scheme. Very careful estimates, he said, had been made, and if a supply of power was available from an outside source, this would hasten the decision of the directors very considerably. Mr. Bury also retorted upon counsel during cross-examination that although, when giving evidence in the House of Lords, he had invited any of the existing companies to take the matter up with him, when he would be prepared to go into it carefully, not one of them had approached him.

After Mr. Hammond's re-examination was concluded on Friday, Mr. J. H. Rider, the Chief Electrical Engineer to the London County Council, was called in support of the scheme. When the Bill was in the last House the London County Council objected to Mr. Rider giving evidence and on this occasion the promoters secured his attendance by the aid of the Speaker's order. Mr. Rider was generally in favour of the scheme, which, he said, was practically identical with that of the London County Council.

Financial evidence was then taken. As has already been mentioned the capital of the company is £4,500,000, with one-third borrowing powers, making a total of £6,000,000. Clause 79 stipulates that "Unless the company shall within twelve months from the passing of this Act obtain a certificate from the Board of Trade that not less than six hundred thousand pounds of the share capital of the company by this Act authorised has been *bona fide* subscribed, and that not less than two hundred and forty thousand pounds of such share capital has been paid up, and unless within two years from the passing of this Act the company shall have substantially commenced their works for the purpose of carrying out their powers under this Act, the Board of Trade, after considering any representations which the London County Council may desire (and are hereby authorised) to make, may order that the powers of the company under this Act shall cease as a whole or any part of the area of supply, and on any such order being made those powers shall cease accordingly."

The promoters named in the Bill are Sir Hugh Bell, Bart., Mr. R. W. Blackwell, Mr. R. S. Guinness, Mr. R. Miller, Mr. G. D. Rowe, Mr. Owen H. Smith, Mr. William D. Ward, Mr. Vincent W. Yorke, and Mr. John Young, and in the last House Sir Hugh Bell and Mr. Owen Smith gave evidence with regard to finance. The effect of their evidence was that Sir Hugh Bell made himself personally responsible for the raising of the £600,000 mentioned in clause 79, and Mr. Owen Smith stated that the other gentlemen mentioned were all prepared to take a substantial interest in the undertaking. Both witnesses, however, made the reservation that the subscription of money would depend upon the form in which the Bill passed, and Sir Hugh Bell, who was called on Friday, repeated this evidence with the addition that he was still satisfied with the Bill, although there had been several modifications in the House of Lords. Mr. Vesey Knox, who appears for a number of authorities outside the London area, asked for a list of names of the other persons associated with those mentioned in the Bill, but Sir Hugh Bell declined, on the ground that the information already given was considered sufficient by the promoters. An appeal to the Committee by counsel met with no success, the Chairman stating that the Committee were unanimously of the opinion that Sir Hugh Bell need not give the information required. The rest of the cross-examination was directed to inducing Sir Hugh Bell to admit that the Bill was not now so satisfactory to the promoters as it had been in its original form, but this completely failed, Sir Hugh emphatically asserting that he was prepared to stand by the whole of his evidence given in support of the Bill in the House of Lords.

BOARD OF TRADE REPORT ON THE BILL.

During the course of Friday the report which the Board of Trade has issued upon the Bill was handed in to the Committee. We give it in full below :—

Clause 53 (Conditions affecting supply). This clause provides for the supply of energy by the promoters, in certain events, to persons requiring a supply of power in the areas of authorised distributors in competition with those distributors. The clause contains provisions such as are usual in Electric Power Acts for protecting authorised distributors from unreasonable competition, together with an additional provision that in considering whether the consent of an authorised distributor is unreasonably withheld the Board of Trade shall "regard all the circumstances of the case including the capital expenditure incurred in connection with the undertaking of such distributor and all charges in respect thereof and the financial position of such distributor." The Board suggest that in the special circumstances of Greater London, it is a matter for consideration by the Committee whether further protection against competition could not properly be given to those distributors who can show that they are exercising their powers with due regard to the interests of the public in respect of the supply of energy for power purposes.

Clause 67 (Liability of undertaking to compulsory purchase). The Board of Trade call attention to the fact that the period of 52 years after which the undertaking will be liable to purchase without payment of compensation in respect of goodwill, &c., exceeds that prescribed by the Electric Lighting Act, 1888, viz. :—42 years. They suggest for the Committee's consideration whether there is any sufficient reason for the more extended period. With regard to the terms of purchase at an earlier date, it appears to the Board that under the clause the purchasing authority might be involved in a liability to pay as compensation in respect of the loss sustained by the company by reason of earlier purchase an uncertain amount in respect of prospective profits, and that on giving notice to purchase the purchasing authority would have no means of gauging, even approximately, what that amount might be. The Board recognise that if the purchase takes place before the expiration of 42 years, terms must be provided for compensating the company for loss sustained by them by reason of the earlier purchase but they consider that those terms, while being of such a character as not unduly to hamper the company in raising the capital necessary for the undertaking, should, at the same time, be such as would enable the purchasing authority to calculate what the compensation would be and as would not involve them in paying an extravagant sum. For instance, the Committee might consider whether the sum payable as compensation for the unexpired period of the 42 years might not be calculated on some such basis as the following :—the average profits properly earned during a certain period immediately preceding the purchase (say five or seven years) to be ascertained and the present value of annual profits at this rate for the unexpired period to be the sum payable in compensation. No doubt other methods of calculating the amount of compensation will be placed before the Committee. The instruction of the House on the 19th October provides that purchasing powers shall be conferred on the London County Council. The Board suggest that provision should be made by the clause not only for compulsory purchase at certain dates, but also for enabling the London County Council to purchase the undertaking at any time on terms to be agreed by them with the company. The Board also suggest for the consideration of the Committee that it would be desirable to empower the London County Council to discharge the sum payable in respect of the purchase of the undertaking, whether by compulsion or by agreement, by the issue of stock or annuities.

Clause 69 (Inspectors, &c.). The Board suggest that on the purchase of the undertaking by the London County Council, the provisions of this clause in so far as they relate to the appointment of Electric Inspectors by the London County Council should cease to operate. It may be a matter for consideration also, whether on the London County Council acquiring the undertaking to be authorised by this Bill, they should not cease to exercise the various administrative duties in regard to the appointment of Electric Inspectors, approval of works, and other matters which are imposed upon them by the Acts and Orders which have been or may be granted relating to the supply of electricity in the Administrative County of London.

Clause 77 (Transfer of Undertakings of Local Authorities and others to Company). The Board do not consider it desirable that the company should be empowered to acquire the undertakings of other bodies without further recourse to Parliament. The Bill does not confer on the company a monopoly in the supply of energy, but the acquisition by them of undertakings under the provisions of this clause might result in the creation of a *quasi* monopoly. In areas where there are two bodies supplying in competition the company might acquire the undertaking of the one body and with the advantages conferred on them by their Act be in a position to subject the other body to an unfair and ruinous competition. Moreover, after a transfer under the clause it would be impossible to say as regards power supply, whether the company were acting as undertakers under the present Act or under the Provisional Order authorising the undertaking transferred to the company, and if such undertaking were that of another company, great confusion may arise when the time arrives under the Provisional Order for the purchase of the transferred undertaking by a Local Authority. It will be difficult if not impossible to determine whether a particular work was authorised by the Act or by the Order and therefore whether it is purchasable under the Order or not. Any transferred works which would be purchasable under the existing purchase clause would if transferred to the company and used by them for supplying other parts of their area cease to be subject to the existing purchase clause. Of course the

Digitized by Google

Board of Trade would never sanction a transfer under the clause without giving objectors the fullest opportunity of being heard, and if the opposition were serious the Board would probably refuse their consent. The Board, however, do not consider that they should have placed upon them the responsibility of deciding such important and controversial questions as might be likely to arise under the clause. They have usually objected to similar clauses in Bills and Provisional Orders, and they are of opinion that the clause ought to be struck out of the Bill. [This would involve a consequential amendment in the first proviso to Clause 55 (Conditions affecting supply).]

Clause 79 (Cesser of powers). The Board suggest that the word "or" should be substituted for the word "and" in the sixth line of the clause, otherwise it might be doubtful whether **the power of the Board to make an Order** under the clause would arise until after the expiration of the second period mentioned in the clause.

On Monday, November 2nd, evidence of a general character was given. Mr. J. F. S. Gooday, General Manager of the Great Eastern Railway Co., and Mr. A. L. Stride, of the London, Tilbury & Southend Railway Co., spoke as to the desirability of a cheap supply; and Mr. Vincent Raven, Chief Assistant Mechanical Engineer of the North-Eastern Railway Co., referred to the effect which electrification had had upon their lines in the Newcastle district. Mr. W. Woodhouse, Engineer of the Yorkshire Electric Power Co., followed, after which evidence was taken from representatives of a number of firms in the area of supply, who supported the scheme in view of the possibility of getting a cheaper supply of electricity than is now possible.

The case for the promoters was concluded on Tuesday, after Mr. Owen H. Smith had concurred in the financial evidence given by Sir Hugh Bell. There were also some further general witnesses.

It has been arranged that the opposition shall take the following order:—Borough Councils, Middlesex County Council, City of London Corporation, Companies.

London Electric Supply Bill and London (Westminster and Kensington) Electric Supply Bill

In the House of Commons last Monday the President of the Board of Trade moved that it be an instruction to the Committee considering these Bills to insert a provision constituting the London County Council the purchasing authority. After a short discussion the instruction was agreed to.

An instruction was then moved by Mr. T. Davies (Fulham) to the effect that the companies shall not be entitled, in the event of purchase of the undertaking, to any additional compensation by reason of the existence of agreements for mutual assistance or association, or for any loss occasioned by severance.

Mr. Churchill stated that he would not recommend the House to adopt this instruction, as the terms of purchase of electric lighting did not raise the question of profits, dividends, prospective advantages, or goodwill.

The amendment was then withdrawn.

A proposal of Mr. Hay (Shoreditch) that powers should be inserted in this Bill conferring linking-up powers upon the local authorities of London was altered to read that the Committee has power to deal with this. It thus did not take the form of an instruction, and was agreed to.

The second reading of the London Electric Supply Bill having been carried, the President of the Board of Trade moved an instruction to the committee that purchase powers on the part of the London County Council should be inserted in the London (Westminster & Kensington) Electric Supply Bill.

This was agreed to.

Mr. T. Lough then moved that a clause should be inserted in the Bill binding the companies not to offer opposition to any future proposals on the part of Borough Councils for mutual assistance, &c.

This was agreed to, and the Bill read a second time.

A similar motion in regard to the London Electric Supply Bill is now on the paper.

Strengthening of Corroded Tramway Poles with Reinforced Concrete.—A recent issue of the *Electric Railway Journal* contains an account of a method adopted by a tramway company in America for strengthening corroded tubular tramway poles by filling them with reinforced concrete. The cap at the top of the pole is first removed, and a suitable cage of twisted steel bars is dropped in. The lower ends of these rods are set in a concrete-iron base, but at the top a hooked cap temporarily confines the upper ends of the rods to allow the cage to pass through the narrower upper section of the pole. Upon the withdrawal of this cap from above the rods flare out towards the sides of the pole. A grouting is then forced in through a hose inserted at the top of the pole, from a tank in connection with a portable motor-driven air compressor, taking current from the trolley wire. These operations have been carried out in the case of a large number of poles by the New York Pole Company who originated the system.

THE TRACKLESS TROLLEY SYSTEM IN LONDON

IN a report by the Highways Committee of the London County Council reference is made to linking up the northern and southern tramway systems *via* the Blackwall and Rotherhithe tunnels.

In 1904 a scheme was promoted for the construction of tramways from Trafalgar Road, Greenwich, *via* Blackwall Lane and Blackwall Tunnel to East India Dock Road. Parliament, however, only sanctioned the tramways along Blackwall Lane, the portion of the scheme affecting the tunnel being struck out. At the time the matter was discussed, considerable stress was laid on the difficulty of taking two lines of fixed traffic through the tunnel owing to the large amount of general traffic, and the probable congestion that would result if tramways were made. Since this date the tramways north and south of the river at Blackwall have been electrified, while the new tunnel at Rotherhithe, which connects with the Council's tramways at either end, has been opened. The Highways Committee now think it right to again consider arrangements for linking up the northern and southern systems. The Committee's attention has been called to the trackless trolley system of electric traction which has been installed in certain places on the Continent. An exhaustive inquiry into the working of this system has been carried out by the Manchester Corporation Tramways Committee and, as the result, the Corporation proposes to seek Parliamentary authority to equip certain routes on this system in the suburbs of Manchester where tramway construction would not be justified on the ground of expense. The question of promoting legislation on this subject is also before the Liverpool Corporation.

The advantages of the system briefly stated are the avoidance of track expenses, and, in some cases, of the necessity for street widenings, and the greater adaptability of the vehicles used to the general traffic conditions. At the same time the disadvantage of carrying accumulators which obtains in the case of electric omnibuses is obviated. The Committee state that it would, in any case, be impossible to construct conduit tramways through the tunnels as there would not be sufficient depth for the necessary excavation, and the previous proposals for the construction of lines in Blackwall Tunnel have provided for the use of overhead traction. As the electric tramways on both sides of the river have been reconstructed for conduit traction, it would in any case be difficult to provide any other than a shuttle service of cars in the tunnel, and the size and mode of construction of the cars need not, therefore, conform to the Council's standard rolling stock. From the information obtainable, it appears that the estimated expenditure on capital account would be £7,925 in the case of Blackwall Tunnel, and £9,335 in the case of Rotherhithe Tunnel. The estimated financial results of the proposed services, taking into account the traffic which will be induced on the Council's existing tramways, are thought likely to be favourable, and the Committee are strongly of opinion that Parliamentary authority should be sought in the session of 1909, to enable the Council to provide and work a service of cars on this system through both the tunnels, and to carry out any incidental works.

In a report upon the matter the Finance Committee state that the question whether, having regard to the amount of information at present available as to the working of systems of trackless trolley cars, the Council would be well advised to inaugurate such a system, is one for the consideration of the Council upon the report of the Highways Committee. From a financial point of view they do not offer any observations upon the proposal to obtain Parliamentary powers. It will, however, be obvious that before the Council actually inaugurates such a system, in the event of the necessary powers being obtained, it will be desirable that further information should be obtained, both as to the practical working of the system, and as to the estimated financial results.

At the meeting of the County Council on Tuesday an amendment was passed, postponing action in the matter until further information is available.

Institution of Civil Engineers.—The only Paper of electrical interest which has received a medal during the past session is Mr. W. Barclay Parson's Paper on the "New York Rapid-Transit Subway," for which the author has been awarded a Telford Gold Medal.

Royal Society.—The following is a list of the Fellows recommended by the President and Council of the Royal Society for election into the Council for the year 1908-9:—President—Sir Archibald Geikie, K.C.B., D.C.L., Sc.D., LL.D. Treasurer—Alfred Bray Kempe, M.A., D.C.L. Secretaries—Professor Joseph Larmor, D.Sc., D.C.L., LL.D., and Professor John Rose Bradford, M.D., D.Sc. Foreign Secretary—Sir William Crookes, D.Sc. Other Members of Council—Sir George Howard Darwin, K.C.B., Professor James Cossar Ewart, M.D., Sir David Gill, K.C.B., John Scott Haldane, M.D., Charles Thomas Heycock, M.A., Professor Horace Lamb, D.Sc., Professor Hector Munro Macdonald, M.A., Frederick Walker Mott, M.D., the Hon. Charles Algernon Parsons, C.B., Professor William Henry Perkin, Ph.D., Professor Edward Bagnall Poulton, D.Sc., Lieutenant-Colonel David Prain, C.I.E., Sir Arthur William Rücker, D.Sc., the Right Hon. Sir James Stirling, LL.D., Professor Frederick Thomas Trouton, Sc.D., and William Whitaker, B.A.

ELECTRIC POWER TRANSMISSION WORKS IN ITALY

IN a report upon the trade and commerce of Venice for the year 1906-07, Mr. Consul de Zuccato makes many references to electrical works in the Venetian provinces. He states that since his last report the development of hydro-electric plants for the supply and transmission of power for lighting, industrial, and traction purposes has continued on a vast scale and in all directions. There appears to be evidence that hydro-electric power is destined in future to produce extraordinary results, and it may in the long run cause a great diminution in coal imports, although so far nothing of the kind has occurred.

Water Power Scheme at Verona.—Under the auspices of the Verona Bank a company is said to have been constituted for the distribution of electric power for illuminating and industrial purposes in the provinces of Verona and Vicenza, in connection with the Milani Canal.

Water Power Plant at Ponte della Serra.—Works are proceeding for constructing a water power plant near Feltre, on the River Cismon, which rises in the Tyrol Mountains and flows into the Brenta in the Valsugana Valley. Through the efforts of Engineer Fortis, of Milan, the Edison and Adriatic companies have provided the funds for this plant, which is being built about 200 metres distant from Ponte della Serra. It is said that the energy to be derived therefrom will be from 6,000 to 9,000 horse-power, to be distributed in the provinces of Padua and Vicenza. The construction of the workshops began in 1906, while the works for the perforation of the rocks commenced in February, 1907. The river was deviated and readmitted into its course through a right angled gallery about 100 metres long, and a bar is to be raised on caissons filled with concrete which will produce a fall about 35 metres (115 feet) high. There will be a large water reserve basin, which will extend as far as the Austro-Hungarian frontier near the Ponte delle Muline. Two plants will subsequently be built lower down the river.

Cellina Works.—On January 1st, 1908, the Italian Company for the utilisation and distribution of electrical power in Venetia, invited an increase of capital and issued 32,000 new shares of 175 lire (£7) each, giving the preference in subscribing for half of the amount to the old shareholders. The total capital of the company, which was formerly 4,200,000 lire (£168,000) has now been brought to £9,800,000 lire (£392,000).

Garda Electric Railway.—A well-attended meeting of the principal notabilities of the provinces of Verona, Mantua, Roveredo, and Trent has recently been held at Torri del Benaco to discuss the purchase of the waterfall called "Vajo delle Pissotte," in the Baldo Valley, or another fall offered by the Commune of Roveredo, to produce the energy required for the projected Garda electric railway. There were loud protestations, as it was stated that a preliminary arrangement had already been made with an Anglo-Italian company for the building and working of this line, when the War Ministry in Rome objected to its construction, on military grounds. The line would run from Verona to Lazise on the lake, and then go on to Benaco and Riva on the Austrian frontier, through a gallery to be bored under Mount Altissimo. From Lazise a small branch would turn towards Peschiera to form a junction with the Venice-Milan line and with the one in construction, Peschiera-Mantua. The line is to be double track of normal gauge. This line, which would place the whole Trent district in direct communication with Verona, Brescia and Milan, would, it is estimated, cost about 13,000,000 lire (£520,000), of which about 2,000,000 lire (£80,000) would be contributed by the provinces and the communes concerned, and the remainder would be provided by the subsidy of 6,000 lire (£240) per kilom., for which the committee have asked the Italian and Austro-Hungarian Governments. The committee are in hopes soon to obtain the concession from the Italian Government, on the ground of public utility, as they state there would be a great development of trade and industry and a large tourist traffic on the Veronese shore of the lake.

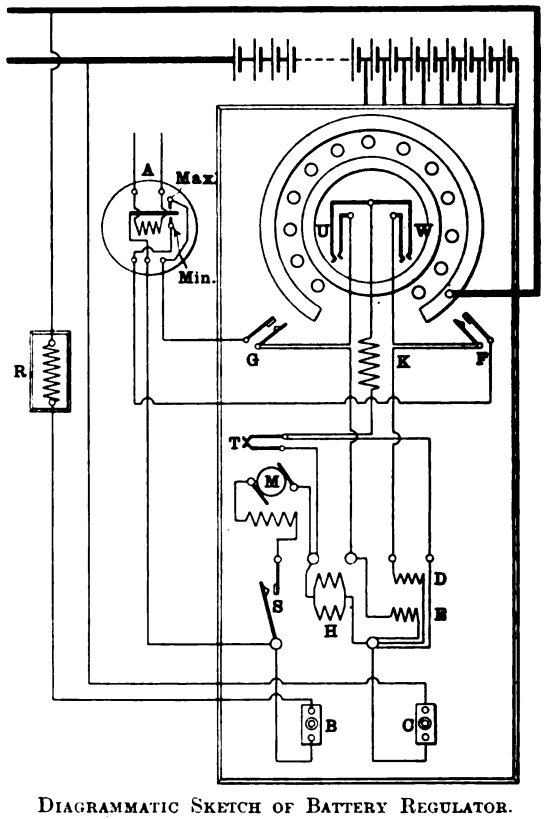
Verona Tramway.—The horse tram in the town of Verona has been transformed into an electric one. This service is carried on by an Italo-Belgian company. The electrical equipment has been supplied by the firm Siemens, of Brussels, and the cars by the Thomson-Houston Co.

Electric Tramway, Padua Vigodarzere.—An electric tramway, which is subsequently to be extended, was opened to the public on April 16th, 1908, between Padua and Vigodarzere, stopping for the present at the bridge of Vigodarzere on the road leading to Torre.

National Telephone Company's Employees.—At a meeting of the National Society of Telephone Employees at the Holborn Town Hall, last week, to protest against the dismissal of workmen by the National Telephone Co. in view of the acquisition of the company's business by the Post Office in 1911, Mr. B. S. Straus stated that the Postmaster-General had come to an arrangement with the company by which the discharges would be stopped.

MOTOR-OPERATED AUTOMATIC BATTERY REGULATING SWITCH

AMONG the exhibits of the Union Electric Co. at the Manchester Exhibition was a 22-way battery regulating switch, with a lever arm for regulating on the charging side, and an automatically-operated lever for the discharge side. The latter lever is also provided with a hand-wheel for hand regulation if required. The operating gear, a diagrammatic sketch of which is given below, consists of a frame to which is imparted an oscillatory or rocking motion by a small motor driving a crank through worm gearing. The rocking frame carries a pawl or detent, which engages with a toothed wheel fixed to the discharge lever shaft. The action of this detent is governed by a solenoid K, and the circuit is completed in this coil by spring contacts U and W alternately. In addition to these, limit contacts G and F are fitted to automatically break the motor circuit when the discharge regulator arm reaches either the maximum or minimum limits. These are protective devices only, and have no other function in the apparatus. The device works as follows:—In the event of the pressure falling in the supply circuit in which the magnetising coil of the contact voltmeter A is connected, contact is made on the lower or minimum terminal of the



DIAGRAMMATIC SKETCH OF BATTERY REGULATOR.

voltmeter. There is then a circuit from fuse B to the centre terminal of the voltmeter, through the minimum contact, through the limit contact F, through the relay coil D and fuse C to the main supply. As the contact relay is energised, the motor circuit is completed through relay S, which is controlled by the electromagnet H. The solenoid controlling the pawl or detent is energised through contacts U and W, the movement of the rocking frame alternately closing and opening the circuits through these contacts, alternately engaging and disengaging the detent with the toothed wheel on the discharge lever, and transmitting the motion of the rocking frame to the latter. By this action a sufficient number of cells are brought into circuit to bring the pressure to its normal value.

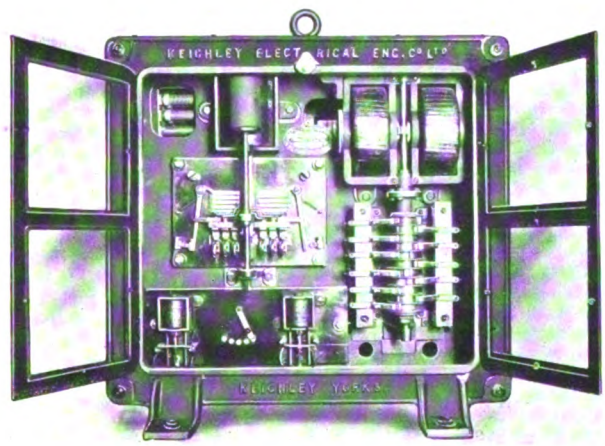
The same operation is carried out in the event of the pressure rising above normal, owing to the load on the battery being reduced, or the battery pressure increasing during charging. In this case the voltmeter makes contact on the maximum or upper terminal. The circuit will then be from fuse B to the centre contact of the voltmeter, thence to the maximum contact through the limit contact G, through relay coil E, through fuse C to the main supply. The motor circuit is completed in exactly the same manner as in the first case, the motor rotating in the same direction, but the movement of the discharge lever is reversed owing to the pawl or detent engaging with the toothed wheel on the reverse stroke of the rocking frame.

Digitized by Google

At the normal pressure, the circuit through the motor remains open by the action of the spring contact T, which shunts the coils of the relay magnet H, thereby breaking relay contact S. The contact voltmeter may be regulated to operate within ± 3 per cent. of normal pressure by adjusting a sliding weight upon the horizontal arm of the lever, and increasing or decreasing the distance between the maximum and minimum contact discs. These discs and the moving element are provided with platinum contacts, and by turning them slightly a new point of contact is always available. Further, they may be removed for cleaning without interfering with the setting of the instrument. In order to prevent hunting or undue oscillation of the horizontal lever, a damping device is fitted, consisting of a small metal cylinder filled with oil, and a light baffle plate rigidly attached to the contact arm.

THE KEIGHLEY SYSTEM OF ELECTRIC LIFT CONTROL

AN interesting lift control gear manufactured by the Keighley Electrical Engineering Co., Ltd., was shown at the Manchester Exhibition by Messrs. John Collier & Co., who hold the sole rights of sale for the Lancashire district. The apparatus exhibited was that which is used for operating a high speed passenger lift, for which an interpole motor rated at $7\frac{1}{2}$ b.h.p. for intermittent use is employed. The normal speed of the motor on the maximum field excitation is 400 r.p.m., corresponding to a travel of the cage at the rate of 100 feet per minute, and the maximum speed 800 r.p.m., equal to a cage



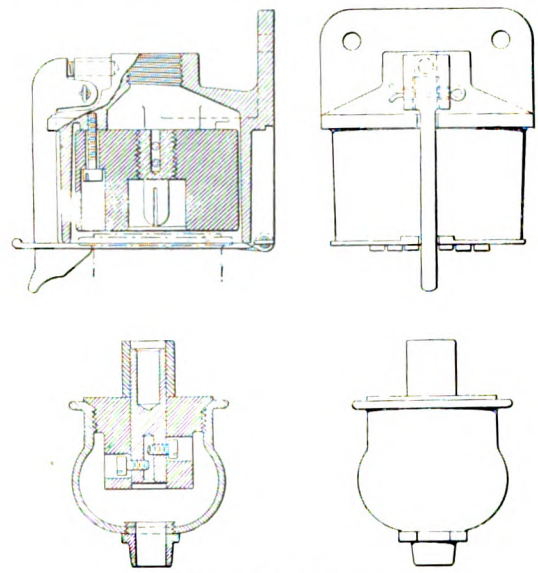
LIFT CONTROLLER FOR CAGE SWITCH CONTROL.

travel of 200 feet per minute. The brake blocks are pulled on to the brake pulley by powerful duplicate springs, and are released by means of ironclad electromagnets, the windings of which are in series with the compound field winding of the motor.

The system of control (Hindle's patent) may be adapted for either hand rope, cage switch, or push-button control; the controller illustrated above is for cage switch control. The direction of travel is determined by means of a controller of the tramway type, actuated by a double solenoid, the magnetic core of which is furnished with a rack, gearing into a pinion on the controller spindle, and rotating the latter in either direction as desired through an angle of about 90 degrees. The main circuit is actually closed, after the operation of the reverser, by a multiple contact starting switch, also operated by a solenoid, which pulls the starter rapidly on to the first contact, the remaining portion of the travel being retarded by an air dashpot. After the armature resistance is cut out (during which operation the field excitation of the motor is a maximum), the starter introduces a resistance in the motor shunt, increasing the speed to the desired amount. The starter itself is provided with six carbon brushes so connected that there are three parallel paths available between the two series of hard-drawn copper contacts to which the starting resistance is connected. The master switch in the cage is connected to the controller proper by a five-core flexible armoured cable, and is provided with three points or positions on each side of the "off" or central position. In starting, this switch may be turned over to the full-on position instantly, and the various operations described, the rotation of the reverser, the cutting out of armature resistance, and the reduction of the motor field, follow in their proper sequence; when approaching a floor, however, the cage switch may be returned from the third to the second position, which has the effect of again building up the motor field, and reducing the speed to one half the maximum. Returning the cage switch to the first position permits the starting switch to return to zero, first re-inserting the armature resistance in circuit, and then opening the circuit at the carbon contacts before mentioned, which at the moment of rupture, are arranged to give a multiple series break, the arc being divided into six distinct portions of negligible amount. At this point in the operation of stopping, with current cut off, and the cage switch in the first position, the reversing controller is still on, and the motor may continue to run very slowly merely by its own momentum, the connections being such that it excites its own field coils and brake magnets. The return of the cage switch to the off position, induces a similar action on the part of the reverser, throwing a duplicate resistance across the armature terminals, which has the effect of absorbing the momentum of the armature itself, and also of absorbing the remaining shunt excitation of the motor and brake coils. The brake blocks are not applied until the motion has practically ceased.

A PROTECTED WALL SOCKET

THE accompanying illustration represents a new pattern of wall socket and plug for use in exposed situations, which Messrs. A. Reyrolle & Co. have recently put upon the market. It will be noticed that the plug is inserted from below, which in itself makes the apparatus more or less rain-proof, but a hinged flap is also provided, which prevents the entry of dust and dirt into



Scale: One-third full size.

IMPROVED FORM OF REYROLLE WALL SOCKET AND PLUG.

the socket, when the plug is withdrawn. The spring catch which keeps this in place when closed also holds the plug by a projecting flange when inserted, avoiding liability to jerking out when the cable is accidentally pulled. The insulating parts of both socket and plug consist of solid blocks of a special material, with no thin places liable to breakage. The construction of the plug is all the more robust owing to the contact arrangement being the reverse of that usually employed, as the pins are placed in a well-protected position inside the socket instead of on the plug. The details of design are well thought out, down to the provision of two screws instead of one for the attachment of each lead in the flexible cable.

Proposed Tax on Gas and Electricity in Germany.—In connection with the proposed taxes in Germany, a Berlin political paper mentions the fact that a tax on gas and electricity for lighting and power purposes has been imposed in Italy for over ten years. The German technical papers, however, correct this statement, pointing out that, according to the Italian law of August, 1895, a tax was imposed on gas and electricity for domestic lighting and heating only. Public street lighting, electric driving, and all other applications of electricity other than domestic lighting and heating, are exempt from the tax. The tax is fixed at about 0·6d. per unit of electricity and about 0·2d. per cubic metre of gas, but the total revenue is said to amount to less than £400,000 per annum. The effect of this tax has been to prevent the introduction of electric heating and cooking apparatus in Italy, and no doubt to retard the progress of electric lighting. As we mentioned on page 495 of our issue of October 1st, it is expected that energy for both lighting and power will be taxed in Germany.

CATALOGUES AND PAMPHLETS RECEIVED

ARC LAMP LOWERING GEAR.—A new brochure issued by the London Electric Firm, of Croydon, contains a series of over forty views of installations where their patent arc lamp lowering gear is in use, and serves to emphasise the universality of this apparatus.

CONTINUOUS-CURRENT DYNAMOS AND MOTORS.—We have received from the Wilson-Wolf Engineering Co., Ltd., of Thornton Road, Bradford, a new illustrated price-list of their continuous-current machines. These include semi- and totally-enclosed and open type motors of various outputs, from a fraction of a horse-power up to 20 h.p., and dynamos up to 12 kw. Complete information about each machine, including dimensions and cost of accessories and spare parts, is given. Particulars of the firm's motor starters and also of a special line of low-voltage dynamos for electrolytic work are included. Motor generators and vertical spindle motors are also manufactured by this firm. A special line of small continuous-current motors for driving sewing machines, emery wheels, &c., and a line of fan motors with combined thrust and journal ball-bearing at the commutator end, are also listed.

ELECTRIC HEATERS.—Appropriately to the approach of colder weather, a handsome new illustrated catalogue of electric heating apparatus has been issued by Simplex Conduits, Ltd. The numerous patterns dealt with include both luminous radiators and heaters working on the convection principle, the radiators covering a wide range of prices. The type illustrated herewith, shows a cheap form of heater introduced for the first time at the exceptionally low price of 40s., subject to trade discount; it has an iron case, matt finish ornamented with nickel *repoussé* work. To cheapen matters as much as possible, however, it is un-illuminated; the consumption is 1,000 watts, and it is amply sufficient to heat small rooms or offices.

SIMPLEX CONVECTION HEATER.

ELECTRICAL SUPPLIES.—A collection of lists recently issued by the A.E.G. Electrical Co. of South Africa, Ltd., deal with various specialities of the Allgemeine Elektricitäts Gesellschaft Foreign Department, including electric fans, crane controllers and resistances, quartz mercury vapour lamps, current-limiting switches, and junction boxes for lead-covered cables.

FIRE BRICKS.—A leaflet from the Castle Fire Brick Co., Ltd., of Northop, Flintshire, calls attention to this firm's fire bricks, boiler seating blocks, flue cones, made from Buckley Mountain fire-clay.

ILLUMINATED ROAD SIGNS.—A pamphlet issued by the Foster Arc Lamp & Engineering Co. gives particulars of a series of illuminated road signs, such as the well-known red triangles and white speed-limit signs intended to warn motorists of places where fast driving is dangerous. Electrically lighted signs are included, as well as those adapted for lighting by gas or oil.

INSTRUMENTS AND SWITCHGEAR.—A new catalogue, consisting of forty or more leaflets filed in a binder, has been issued by Messrs. Nalder Bros. & Thompson, Ltd., and deals with a large variety of instruments and switches. The apparatus is classified in sections, and a leaflet describing any new development can easily be inserted in the section to which it belongs. Each leaflet contains, besides a wood-cut illustrating the apparatus, a brief technical description, dimensions, and prices, and all leaflets are of a uniform (quarto) size. In the section on switches the new patterns of overload and reverse-current circuit-breakers described in one of our recent Manchester Exhibition supplements, are given, and sections dealing with leakage indicators, recording instruments, testing sets, the "Ohmer," or combined ohmmeter and generator, and three-phase wattmeters for unbalanced loads are also included. Among the recent additions are leaflets describing a new pen for recording instruments, and an automatic switch for protecting earth-current recorders by short-circuiting the recorder when the current exceeds a predetermined maximum.

STORAGE BATTERIES.—A small list is to hand from Messrs. Pritchetts and Gold, Ltd., which is in reality some advance sheets of a larger and fuller catalogue of the firm's well-known storage batteries, which will be issued later. It will be found of use as giving, in a convenient form, the capacities, weights, and dimensions of the standard H and C type cells in glass boxes. The positive plates of these cells are of the Planté formed type.

SWITCHGEAR, FANS, &c.—Two lists issued during the past week by Messrs. Johnson & Phillips deal respectively with electric fans and standard switchboard panels.

TANTALUM LAMPS.—Messrs. Siemens Brothers' Dynamo Works, Ltd., have issued a neat little booklet, measuring 3½ in. by 6 in., containing illustrations and particulars of tantalum lamps and photographs showing their brilliant effect in a variety of different kinds of installations. Particulars are also given of special holophone shades and adapters suitable for these lamps.

TRANSFORMERS.—A carefully arranged and well-printed booklet on the characteristics, manufacture, and use of the "Berry" transformer has been issued by the British Electric Transformer Co., Ltd., of Hayes, Middlesex. There are about fifty excellent half-tone reproductions of photographs illustrating the "Berry" type of transformer in various stages of construction, and showing the system adopted for building up the iron core on a spindle. The method of winding and insulating the coils, and the way in which the iron circuit is completed by bridging across the extremities of the radial end pieces are also clearly shown in these illustrations. A diagram demonstrating the progress made by the firm during the last ten years, and another giving efficiency curves are included, together with a vertical section of a "Berry" transformer, and a coloured horizontal section illustrating the arrangement of the coils and the provisions for ventilation. The first part of the text deals with the transformer generally, and the work of the company in developing an efficient and thoroughly sound piece of apparatus. The construction of the "Berry" transformer is then dealt with, and finally a few notes on the "Berry" series gear for reducing light load losses, are given. A full description of this series gear with diagrams and illustrations will be found in ELECTRICAL ENGINEERING, Vol. III., page 197. It is stated that a separate booklet describing this series system is in course of preparation. It may be mentioned that the company is British throughout, as the name implies, all the work being carried out at the shops at Hayes.

WALL PLUGS, ADAPTORS, &c.—Messrs. A. P. Lundberg & Sons have issued revised editions of several of their pamphlets dealing with this class of apparatus, and the addition of a few new patterns renders the number of combinations of switches, plugs, adaptors for lamp holders, &c., even more complete than before. Among the wall-sockets and plugs may be mentioned the combined switches and sockets, and the two-pin adaptor, whereby two or more ordinary plugs can be connected to one socket. The series of lamp-holder adaptors includes apparatus whereby plugs can be connected to lamp-holders, and an ingenious series adaptor for metal filament lamps, whereby two holders close together can be utilised with no alteration to the wiring. This simply consists of a pair of adaptors each with only one contact plate, and the other terminals connected by a flexible wire.

Westminster Supply Corporation's New Power House.—Under the London County Council (Tramways and Improvements) Act of 1900, certain street widenings were authorised which necessitated the removal of the generating station of the Westminster Electric Supply Corporation in Millbank Street. It was agreed that the station should be removed to a site equally convenient in every respect and of equal size. The Millbank Street site was close to the river, which provided condensing water at little cost, and also permitted coal to be brought by barges and the ashes to be taken away by water also. A new site has been offered in Horseferry Road, which, however, is not on the river, so that special arrangements will have to be made for procuring condensing water from the river, and coal will have to be carted. Arbitration proceedings commenced last week with regard to the matter, the company claiming that in the absence of equal facilities, a money payment should be made by the Council. Another matter was a disagreement as to the arrangements for obtaining condensing water. The arbitration is being held before Mr. Symon, K.C., as umpire, with Messrs. Young & Falconer as arbitrators. An adjournment for a few weeks was made on the second day to enable Sir Alexander Kennedy, on behalf of the company, and the Council's Engineer to discuss some of the details in dispute.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 29th, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in brackets indicate communicators of inventions from abroad.

1907 Patents

5,560. **Operation of Rail Points and Plough Guides from a Car.** W. J. STEWART. This specification covers an apparatus whereby the rail points and plough guides of a conduit tramway system may be worked by the driver of the car. It consists of an arm which projects into the slot, and which is connected by lever mechanism with the rail points and the plough guides. A plunger is let down from the car into the slot, when it is desired to move the points; and this plunger engages with the arm, and causes the points to move over. The points are controlled by a spring, which returns them to the normal position when the car has passed. To hold the points in position when the car is passing, a locking mechanism is provided; the latter is released when the car has gone by. Twelve claims, thirteen figures.

19,882. **Rotor Field Construction for Turbo-Alternators.** BRITISH THOMSON-HOUSTON CO. AND F. H. CLOUGH. The holes for the exciting winding are tunnelled at a greater depth below the surface of the rotor than usual, and the iron above the holes is cut away between the poles to lessen magnetic leakage. By this means, the use of teeth of non-magnetic material between the poles is rendered unnecessary. The end connections are surrounded by a retaining ring, the diameter of which does not exceed the internal diameter of the stator. The arms of the spider are arranged to come opposite to the pole centres. Four claims, two figures.

25,902. **Artificial Cooling of Commutators.** PHŒNIX DYNAMO MANUFACTURING CO., LTD., AND R. POHL. Adaptations of the brush-gear of electrical machines, whereby it is used also as an apparatus for cooling the commutator, are described in the specification. Where a holder of the box type is used, the holder is provided with passages through which air is forced, and jets of cool air are thus caused to impinge on the commutator near the brush tips. The passages are largest nearest the lugs, where the current density and heating are greatest. In another method, the air is forced out of holes in the brush spindles. Three claims, three figures.

27,596. **Alternator Winding.** MATHER & PLATT, LTD., A. C. COUBROUGH, AND J. FRITH. To avoid the use of large section conductors, and the loss due to eddy currents in the same, the armature of an alternator is provided with a number of slots per pole per phase equal to, or a multiple or submultiple of the number of poles. The windings are then arranged so that there are several circuits in parallel in each phase. The conductors in each phase occupy every possible slot position in that phase in passing round the machine. By this distribution of the winding, the wave form is improved and the inductance of the armature diminished. One claim, two figures.

1908 Patents

6,245. **Supports for Metal Filaments.** WESTINGHOUSE METAL FILAMENT LAMP CO., LTD. Owing to the high coefficient of expansion of metal filaments, it is necessary to have a flexible support at the end of the loops. Instead of using a spring, it is proposed to hang a short wire loosely on to the filament, and to limit the movement of this wire by passing it through a short glass tube or a wire loop, the other end of the wire being bent to prevent it slipping through the tube or loop. Four claims, two figures.

12,556. **Carbons for Searchlights.** SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens-Schuckertwerke-Ges.*) The reduction of the section of the negative carbon in searchlights is known to increase both the intensity and the steadiness of the light. According to this invention the carbon is protected from being too quickly consumed by providing it with a cover of copper or other metal. The copper sheath is melted off before the arc is reached, and there is no discoloration of the arc. By this arrangement a negative carbon for 150 amperes need only have a section of 0·8 sq. cm. instead of 5·0 sq. cm. The positive carbon is arranged horizontally, and the negative carbon is inclined at an angle of about 60° to the horizontal. Two claims, one figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in brackets indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

22,473, RIZZO. Electric ships' logs.
22,578, MOODIE. Dynamos carried by motor cars, vessels, or like moving bodies.
22,737, GRADOLPH & HAHNE. Transmission of telephonic and undulatory currents.
22,756, PRESTON & KENNARD. Lighting of railway carriages.
22,860, KALISZ. Galvanic cells.
23,158, BERRY. Fuse-controlled apparatus.
23,148, JOHNSON & PHILLIPS, LTD., & TUBBS. Arc lamps.
23,224, FYNN. Single-phase motors.
23,235, COWPER-COLES. Manufacture of metal tubes.
23,774, GRAETZER. Electrical connection devices.
23,914, BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*). Controlling devices.
24,200, GAGLIO & VILLANI. Switch operating devices.
24,294, MASCORD & BLAKE. Electric bells.
25,398, WUNDERLICH & HUGHES. Raising and lowering of arc lamps.
26,251, MONSON. Telephone systems.
27,010, NOBEL'S EXPLOSIVES CO. & DICKIE. Telegraphic code condensers.
27,298, JOHNSON (Firm of *W. C. Heraeus*). Connecting device for electrical instruments.
28,289, BRAY, & BRAY, MARKHAM, & REISS, LTD. Circuit breakers.
28,507, HARRISON. Overload indicators.

1908 Patents

1,546, PHŒNIX DYNAMO MANUFACTURING CO. & POHL. Armature windings for high-speed continuous-current machines.
2,795, SOANS. Party-line telephone systems.
3,266, JOHNSON & PHILLIPS, LTD., & PATERSON. Arc lamps.
5,099, LUNDBERG, LUNDBERG, & LUNDBERG. Switches.
5,387, BLOXAM (*Siemens & Halske Akt.-Ges.*). Manufacture of electric lamps.
7,188, NATHUSIUS, & WESTDEUTSCHE THOMASPHOSPHATWERKE-GES. Electric furnaces.
9,492, SHEPPEE & SHIPPEY. Motors for pumps.
11,136, STECKEL. Electrical induction clutches.
11,603, SIEMENS & HALSKE AKT.-GES. Manufacture of tungsten filaments.
12,175, RORKE & RORKE. Switch.
13,361, VOSS. Automatic electric advertising apparatus.
15,362, EDISON. Metallic films and process of preparing the same for use with storage battery electrodes.
17,419, LITTLE. Arc lamp electrodes.
17,511, SCHMAHL. Conduit junction boxes.
17,512, SCHMAHL & HENDERSON. Conduit junction boxes for outlet fittings, such as switches and wall plugs.
18,372, ALLGEMEINE ELEKTRICITÄTS-GES. Alternating current commutator motors.
19,169, GLÜHLAMPENWERKE ANKER-GES. Process for packing metal filaments.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

1,240, GUILLOT. Suspension of electric conductors.
2,245, CLEIREN. Power transmission.
15,742, SIEMENS & HALSKE AKT.-GES. Time limit relays.
20,466, FESSENDEN. Wireless telegraphy.
21,069, LUNGREN. Insulated projecting lantern.
21,195, RUTHARDT & RUTHARDT. Rotary current breakers.
21,482, MILLER. Electric automatic train-controlling systems.
21,580, AKT.-GES. BROWN, BOVERI, & CIE. Control of electric power systems.
21,586, LUX. Measuring instruments for alternating currents according to Paalzow-Rubens' Bolometric principle.
21,603, ALLGEMEINE ELEKTRICITÄTS-GES. Devices for protecting transformers, cables, &c.
21,659, N. JACOBSEN'S ELEKTRISKE VAERKSTED. Electrical signalling system.

Expiring Patent

The following patent expires during the current week after a life of fourteen years :—

21,827 of November 12th, 1894. **Asynchronous Self-Exciting Alternating-Current Generators.** J. IMRAY (*La Société Anonyme pour la Transmission de la Force par l'Electricité.*) Single-phase and polyphase generators, in which the armature consist of a series of stationary bobbins, and the field of a short-circuited "squirrel cage" rotor. The necessary exciting current, which must be out of phase with the armature current, is obtained by means of connecting condensers across the armature winding, or from a separate alternator.

LOCAL NOTES

ABERDEEN: *Supply to Tramway Co.*—A draft agreement between the Aberdeen Suburban Tramways Co. and the Corporation as to the price for electrical energy supplied by the Corporation, and the duration of the final agreement, to be fixed by a Board of Trade arbitrator, has been approved by the Corporation.

ARGENTINA: *Death from Electric Shock.*—In connection with the deaths of two wiremen of the Telephone Co., in Cordoba, due to a broken wire coming in contact with the high-tension mains of the Electric Light Co., the *Review of the River Plate* remarks that it is about time that the Cordoba authorities took steps to make the Electric Light Co. put their mains and installations in general into proper order, as their present condition is scandalous in the extreme and a constant menace to the public.

AUSTRALIA: *Melbourne Railways Electrification.*—It is stated that the Premier of Victoria has recommended the electrification of 29 miles of the Melbourne Suburban Railway system, which forms the first stage of the scheme outlined in Mr. Merz's report. The estimated cost of the work is about £300,000. We gave some lengthy abstracts, together with illustrations, from the report in our issue for September 24th, p. 451.

BARNSTABLE: *Expert's Report.*—Mr. W. H. Trentham is preparing an independent report upon the electrical undertaking.

BLACKROCK: *Dispute with Tramways Company.*—With reference to our note last week as to the possibility of a legal action between the Urban District Council and the Dublin United Tramways Co. regarding the condition of the tramway track in Blackrock, terms have now been arranged between the parties, and the Tramway Co. will commence the work very shortly.

BRIGHTON: *Electric Omnibuses.*—The Buildings Committee have approved plans of a proposed electric charging station for the Brighton, Hove & Preston United Omnibus Co., Ltd. Electrical energy will be taken from the Corporation.

Tramway Receipts.—The aggregate receipts to date upon the municipal tramways are £30,022, an increase of £570 upon the corresponding period of last year.

CARDIFF: *Tramcar Advertisement Contract.*—In the King's Bench Division last week, an action was taken by the Corporation against Edwards, and another to recover £500, being one quarter's rent at £2,000 per annum for placing advertisements upon the city tramcars. There was no appearance on behalf of the defendants, and Mr. Justice Bucknill gave judgment for the amount claimed and costs.

CHIPPING NORTON: *Electric Lighting.*—The Council has made an application to the Board of Trade for an electric lighting Provisional Order.

DEVONPORT: *Mechanical Stokers.*—Twelve months ago the Corporation fitted an underfeed stoker as an experiment. This proved so successful that four additional machines have been fitted, and were inaugurated last week. The total cost has been about £1,400. In future it will be possible to burn coal at 11s. 6d. to 12s. 6d. per ton, against 14s. to 15s. hitherto.

EDINBURGH: *Cost of Deputations.*—A return of Town Council deputation expenses has been prepared by the City Chamberlain, and amongst them are included the expenses of the delegates to attend the Home Office inquiry with regard to Electricity Regulations, and the annual Convention of the Incorporated Municipal Electrical Association at Nottingham. The total cost of the former was £55 4s. 6d., and the latter £58 6s. 4d.

EGHAM: *Supply to Small Consumers.*—The Guildford Electricity Supply Co. are preparing a scheme for wiring small houses, and supplying lamps and energy at 2s. 6d. per lamp a quarter, the current being available from dusk to daylight.

EPSOM: *Electricity Accounts.*—The Lighting Committee's recommendation that the services of Messrs. Jackson, Pixley & Co., chartered accountants, be obtained at a cost of £26 5s. to draw up a statement of the accounts of the electricity undertaking since its inception on a commercial or trading basis, has been adopted.

GLASGOW: *Tramway Running Powers.*—A letter has been received by the Tramways Committee from the Dumbarton, Burgh & County Tramways Co., asking that the company be allowed to run their cars over a section of the Corporation tramways in the Burgh at Clydebank, between Duntocher Burn and the Forth and Clyde Canal in Dumbarton Road, until the new bridge over the canal is completed. The Tramways Committee have remitted the question to the Sub-Committee on Extensions, with full powers to enter into and complete an agreement.

HEYWOOD: *Tramway Running Powers.*—The Town Clerk has been instructed, on the recommendation of the Finance and General Purposes Committee, to take the necessary steps to obtain a Parliamentary Bill to secure mutual powers in Heywood, Bury, and Rochdale.

HULL: *The Trackless Trolley System.*—The Tramways Committee are to give consideration to the report of the Manchester deputation which inspected the trackless trolley system on the Continent.

ILFORD: *Management of Tramways.*—A resolution was moved at the last meeting of the Council, by Councillor Brand, to the effect that it would be advisable to appoint an expert tramway manager, instead of allowing the Electrical Engineer to occupy the dual position of Electrical Engineer and Tramway Manager. An amendment was passed, however, referring it to the Tramways Committee to consider whether any alteration was desirable in the present management of the tramways.

KINGSTON-ON-THAMES: *Electricity Accounts.*—The fourteenth annual report of the electricity undertaking states that the number of consumers has gone up during the twelve months from 909 to 1,024, while the number of connections has increased from 40,741 8-c.p. lamps to 45,229. After paying working expenses there is a balance of £5,209. Payment of interest and instalments of loans caused the net result of the year's working to be a debit balance of £884, as against a debit balance last year of £7. The chief causes of this increased debit balance are a rise in the price of coal of £550, and a decrease in revenue of £188, due to the general adoption of the flat rate of charge, and the reduction in the price of current for power and heating from 2d. to 1½d. The use also of metallic filament lamps contributed to a temporary reduction in the revenue receipts. The total number of units generated was 652,968, which was the largest for any one twelve months in the history of the undertaking, while the receipts per unit averaged only 4·112d, which is the lowest price in the history of the undertaking.

LEEDS: *Public Lighting.*—A street lighting experiment is now being carried out in Manningham Lane, one length of the thoroughfare being illuminated by arc lamps, under the direction of the electricity department, and another section by incandescent gas lamps.

LIVERPOOL: *The Turbine Contract.*—As we have reported from time to time, there have been many discussions and some insinuations made with regard to the Westinghouse turbines in the Lister Drive Power Station. In our issue for October 8th we gave an abstract of the final report of Mr. Bromley Holmes, the Corporation's Consulting Engineer, upon these turbines, in which he took them over from the contractors as being perfectly satisfactory. In the discussion upon this report, Sir William Bowring referred to it as a "whitewashing report," and as a consequence Mr. Bromley Holmes, having taken this as a reflection upon his professional honour, has had a long correspondence with the Councillor with a view to having the remark publicly withdrawn. The correspondence, which was of a more or less friendly character, failed to bring about this result, however, and in his final letter Mr. Bromley Holmes states that he is advised that the remark in question constitutes a very injurious reflection upon his official conduct as well as upon his professional character. He further states that he will not trouble Sir William Bowring with any additional personal correspondence.

LONDON: *London County Council: London Traffic Commission.*—The Prime Minister has been asked to receive a deputation in relation to the report of the Royal Commission on London Traffic, during November.

"G.B." Surface Contact System.—The Highways Committee have now notified the Council of the receipt of Mr. W. M. Mordey's report upon the G.B. surface contact system in the Mile End Road. They are communicating with the G.B. Surface Contact Co. with regard thereto, and propose to report fully to the Council on November 10th, 1908, on the whole subject.

Side Slot Tramways.—Frequent delays have occurred on the Kingsland Road tramways through the defective working of the experimental portion of side slot tramways laid in that thoroughfare. The difficulty arises through the car ploughs becoming jammed at the points where the centre slot changes to side slot and *vice versa*. These delays, which are sometimes of extended duration, have resulted in serious loss of traffic, and in addition considerable expense is involved in repairing the damaged ploughs and points. It is thought that the difficulty might be overcome if the slot diversions, where the change from centre to side takes place, which are at present made in lengths of 19 ft. 3 in., with a radius curve of 40 ft., were altered to a length of 32 ft. 8 in. with a curve of 200 ft. radius. With this proposed alteration the plough will have more time to travel from the centre of the plough carrier to the side and *vice versa*. The cost of altering the whole of the 12 diversions on this route in this manner is estimated at £1,000. After carefully considering the matter, the Highways Committee are of opinion that it would be advisable that two diversions on the down track at Downham Road, where most of the delays have occurred, should be altered as an experiment with a view to ascertaining the effectiveness of the alterations. The cost involved by this proposal will be about £170.

Fulham: Metal Filament Lamps.—The Borough Electrical Engineer has been experimenting with metal filament lamps for street lighting, and the result has proved that the Osram lamp gives the most satisfaction. The actual life of the lamps cannot

Digitized by Google

yet be given, but they have already given some 1,300 hours' light, as compared with 450 hours given by three other makes. Arrangements have been made with the makers of the Osram lamp to guarantee an average life of 1,100 hours. It is proposed to change the whole of the 32-c.p. carbon filament lamps to 200-volt 75-c.p. Osram lamps. The Electricity Committee have decided, subject to the usual sanction, to carry out the work immediately, and tenders are to be invited for the supply and fixing of the requisite fittings.

Hammersmith: Condition of Tramway Track.—A letter has been received from the Board of Trade to the effect that the London United Tramways, Ltd., have applied to them, under Section 33 of the Tramways Act, 1870, to appoint an engineer or some other fit person to settle the difference which has arisen between the Borough Council and the company as to the condition of the tramway tracks. The Town Clerk has replied, expressing the Council's disagreement with the company's contention that the difference calls for the arbitration of the Board under the section in question

Marylebone: Public Electric Lighting.—The Electric Supply Committee recommend that a sub-committee be appointed to consider a proposal for lighting the streets with electricity. Owing to the large lighting and power supply which Messrs. Selfridge & Co. require at their new premises in Oxford Street, it will be necessary to carry out certain extensions to the distributing system. This work, which will cost about £3,000, is to be put in hand forthwith. The committee consider the present is a good opportunity for adopting electric street lighting generally. The streets, they say, can be lit as cheaply by electricity as by gas, and the report of the Consulting Engineer shows that, leaving out the cost, if any, of the removal of the gas company's property, and the insurance against damage to the lamps by vehicles, the whole of the lighting in those streets in which mains are already laid can be done electrically for £8,650 for the first ten years, as against a charge of £8,818, the cost of the present gas lighting; while after ten years the charge for electric lighting will be only £8,130.

Poplar: Standby Supply.—The Electricity Committee has received an application from Stepney Borough Council for a standby supply of electricity pending completion of their second generating station at Limehouse. No capital expenditure will be incurred by Poplar, as the spare plant at the main station will be sufficient to afford the supply, while the expenses of coupling up the mains is to be borne by Stepney. It has therefore been agreed to provide Stepney with a supply of electricity to the extent of 500 kw. at any time during the period ending September 30th, 1909, at a cost of £100 for the right of taking a supply whether current is taken or not, and a further sum of ¾d. per unit. In the event of a breakdown or insufficiency of plant, Poplar has the right to cut off the supply.

Wandsworth: Public Lighting.—The County of London Electric Supply Co., Ltd., have asked to be allowed to erect in certain positions in the borough some specimen lamps for the purpose of demonstrating the efficiency of electric lighting as compared with gas for street lighting. Permission is to be granted under protective conditions.

MANCHESTER: *Proposed New Tramways.*—The *Manchester Guardian* states that a syndicate is in the course of formation with the object of financing the promotion of a Bill in Parliament during the next session for powers to construct a system of electric tramways to connect the existing tramways to Stalybridge, Hyde, Mossley, and Dukinfield Joint Board with the Glossop and Hadfield tramways, *via* Mottram and Woolley Bridge (Glossop). The total route mileage will be about seven miles, and the use of single-deck cars is contemplated, owing to the heavy gradients in the vicinity of Mottram. The engineers to the scheme are Messrs. J. M. Newton and J. W. Welch, both of Manchester. The offices of the syndicate are at 13 Spring Gardens, Manchester. Our contemporary further states that should the present scheme go forward and be authorised by Parliament, it is intended during a subsequent session to apply for further Parliamentary powers to construct a mono-rail tramway (about three miles long), from Mottram village along the Stockport Road, *via* Hattersley to Gee Cross, Hyde, to connect there with the Oldham and Stockport tramways, and also another mono-rail tramway (about five miles long) from the Plough Inn (near the Dinting railway viaduct), Glossop, along the Glossop-Marple Road, *via* Charlesworth and Compstall to Marple Bridge.

NEWCASTLE: *Tramway Accounts.*—In the report for the year ended March 31st, 1908, Mr. E. Hatton, the Corporation Tramways Manager, states that the gross receipts amounted to £217,080, compared with £215,120 last year, and that the working expenses were £115,378, against £106,081. The balance, after meeting capital charges, &c., is £19,477, which has been added to the general reserve and renewals fund, bringing that fund to £62,323.

OLDHAM: *Tramways and Trolley Omnibuses.*—Among other matters which will be included in a Bill promoted by the Corporation next session are some tramway extensions and powers to run trolley omnibuses. An extension of the area of electric supply will also be included.

SHREWSBURY: *Hiring Fittings, &c.*—In a general powers Bill, which will be introduced in the coming session of Parliament, authority will be asked to supply and hire fittings, apparatus, &c., for electric light and power purposes.

SOUTH SHIELDS: *Supply by Power Co.*—At a meeting of the Council last week the County of Durham Electric Power Co. applied for permission to lay three underground cables for the purpose of supplying the Harton Collieries, upon certain conditions, including a rental of £250 for wayleaves, terminable by twelve months' notice. The necessary sanction is to be given.

STOKE: *Local Government Board Loans.*—The Council recently made application to borrow money for further extensions, but sanction has been withheld by the Local Government Board in respect of a portion of the proposed loan. On the recommendation of the Electricity Committee, a deputation, consisting of the Chairman, Vice-Chairman, the Mayor, Town Clerk, and Electrical Engineer has been formed to wait upon the Local Government Board, and lay before it the Council's views on the matter. Mr. John Ward, M.P., and Mr. Albert Stanley, M.P., have been requested to accompany the deputation.

STOURBRIDGE: *Electric Lighting Order.*—The Shropshire, Worcestershire & Staffordshire Electric Power Co. and the Midland Electric Corporation for power distribution, have made a proposal to the Council, whereby the existing Provisional Order shall be cancelled and a new order applied for by the Stourbridge Council. The companies ask for a clause in the new order repealing the Stourbridge Order of 1899, and also for the variation of certain clauses contained in the deed of transfer from the Stourbridge Council to the Shropshire Power Co., dated December 31st, 1906. The Electric Lighting Committee's recommendation that the proposal should not be expedited in its present form has been adopted.

WORSLEY: *Council v. Power Company.*—The Council have refused permission to the Lancashire Electric Power Co. to supply current to Messrs. C. Lane & Sons' Hope Mills, Walkden. The Council object to the L.E.P. Co. laying their mains piecemeal—as they obtain contracts—in their township.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ESSEX COUNTY LUNATIC ASYLUM.—The Committee of Visitors of the Essex County Lunatic Asylum invite tenders for the supply and erection of the following plant :—1. Two steam dynamos (100 kw.), steam and motor balances, main switchboard, and travelling crane. 2. Steam, exhaust and rain pipes, and valves. 3. Main cables, distribution boards, wiring, and lamps. 4. Motors, motor starters, and cable connections. 5. Telephones, bells, fire alarms, and electrically-driven clocks. Particulars from the Clerk, New Street, Chelmsford, on and before November 7th, fee £5, returnable, and tenders by November 30th. The engineers are Messrs. Hawtayne & Zeden, of 9 Queen Street Place, E.C.

HULL.—A new feeder cable to the value of about £1,500 is required.

LEITH.—Tenders are invited for the supply of steam slack to the electricity department.

LEYTON.—The Local Government Board has sanctioned the borrowing of £1,000, repayable in 60 years, for the purchase of additional land for the generating station.

LONDON: *Islington.*—A letter has been received from the Finance Committee of the London County Council with reference to the Council's application for a loan of £7,205 in respect of the electrical undertaking. The letter points out that a portion of the expenditure for which the loan is required was incurred some years ago, and the Finance Committee of the London County Council state that they propose to recommend the Council to sanction a loan of £5,541 for various purposes, on the understanding that no further sanctions for balancing purposes in respect of capital expenditure to March 31st, 1908, will be applied for. The letter has been referred to the Finance Committee of the Borough Council for consideration.

MIDDLETON.—Tenders are invited for the supply of 880 yards of three-core distributor cable. Particulars from the Borough Electrical Engineer, and tenders by November 11th.

PENANG.—It is stated that the Government has sanctioned a proposal of the Municipal Commissioners to raise $100,000 for the extension of electric lighting undertaking, including generating plant.

ROTHERHAM.—The Thryberg Parish Council are desirous of entering into a contract for the lighting of certain streets, &c., by means of electricity. Proposals should be delivered to the Clerk to the Parish Council, 4 Clifton Bank, Rotherham, by November 9th.

Digitized by Google

Miscellaneous

AUSTRALIA.—A copy of the specification and conditions for the supply of coin attachments for telephones required by the Deputy Postmaster General, Melbourne, is filed at the Commercial Intelligence Branch at the Board of Trade. Tenders will be received up to December 22nd.

A new multiple switchboard is to be erected at Ballarat (V.).

BECKENHAM.—An application is to be made to the Board of Trade for a small loan for the provision of suspension gear for the street arc lamps.

BRADFORD.—The Tramways Committee invite tenders for stores, including electric lamps, for cars, insulating tapes, &c. Particulars from the Tramways Manager (fee, one guinea, returnable), and tenders to the Town Clerk by November 14th.

BRAZIL.—A concession originally granted to Eduardo Pellew Wilson for the installation and working of a telephone system in Bahia has been transferred to Messrs. Guinle & Co. A copy of the contract is filed at the Commercial Intelligence branch of the Board of Trade.

A decree has been issued authorising the Ministry of Industry, Ways, and Public Works to contract with Senhor Luiz Soares de Gouvea for the construction of a railway from Taipu to Caico. The material for this is to be imported from abroad, and includes telegraph apparatus, wiring, and machinery for workshops. A copy of the contract, which has been signed, is filed at the Commercial Intelligence Branch at the Board of Trade.

BRIGHOUSE.—Tenders are invited for a hollow engine-room floor, 54 feet by 30 feet, in ferro-concrete. Particulars from the Borough Engineer, and tenders to the Town Clerk by November 14th.

Tenders are also invited for the erection of the transformer station.

DUBLIN UNITED TRAMWAYS CO.—Tenders are invited by November 30th for general stores, including electrical supplies. Particulars from the Secretary.

LONDON GENERAL OMNIBUS COMPANY.—Tenders are invited for the supply of stores during the year 1909, including electrical appliances. Particulars from the Joint Managers' Department, 8 Grosvenor Road, Westminster, on November 9th and 10th, and tenders to the Directors by November 19th.

LONDON: *Fulham.*—Tenders will shortly be invited for fittings in connection with a change over from carbon filament to metal filament lamps for street lighting.

Hammersmith.—The Electricity Committee have under consideration a report from the Electrical Engineer upon the increasing demand for current for power and lighting purposes, and the necessity for considerable extensions at an early date of the plant and distributing system.

MANCHESTER.—The Tramways Committee invite tenders for structural alterations and additions at the tramway depôt, Hyde Road. Particulars from Mr. J. M. M'Elroy, the General Manager, and tenders by November 17th.

TASMANIA.—Tenders are invited by March 15th, 1909, for the supply of a common battery switchboard, and apparatus for use on subscribers' premises at Launceston, Tasmania. Specifications, special conditions, &c., can be seen at the General Post Office, Hobart, Sydney, Melbourne, Brisbane, Adelaide, and Perth, where tender forms can be obtained.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—School (£12,948), Dingle Lane, Poplar. Builders, J. & C. Bowyer, Ltd., Upper Norwood, S.E.

School (£6,257), Farrance Street, Limehouse. Builder, T. D. Leng, Evelyn Street, Deptford.

School (£3,111). Carter Street, Mile End. Builders, F. & T. Thorne, Isle of Dogs, E.

Poplar Educational Divisional Offices. T. J. Bailey (Education), Architect to L.C.C., Victoria Embankment.

E.C.—Premises for German Y.M.C.A., City Road (£19,000). Architect, G. Waymouth, Raymond House, 32 Theobalds Road, W.C.

S.E.—Additions (140 places), St. John's Church of England School, Russell Place, Greenwich. The Managers.

Enlargement (£650), Blackheath, Lee, Lewisham, and Greenwich School of Art. Secretary of Committee.

Addition to mortuary at Seamen's Hospital, Greenwich. Builders, Holliday & Greenwood, 144A Loughborough Park, Brixton.

Addition to Inlaid Linoleum Works, Blackwall Lane, Greenwich. Builder, Wm. Downs, Hampton Street, Walworth, S.E.

Enlarging "Oliver Goldsmith" School (£5,763), Camberwell Builders, J. & C. Bowyer, Ltd., Upper Norwood.

Enlarging Gloucester Road School (£1,549), Camberwell. Builders, J. & C. Bowyer, Ltd., Upper Norwood.

S.W.—New concert hall, High Street, Tooting (accommodation, 1,440 persons). Architects, Emden, Egan & Co., 2 Lancaster Place, W.C.

Extension of Trevelyan Hall, St. Ann's Lane, Westminster. H. S. Rogers.

Additions, Wellington House Hotel, Buckingham Gate. Architects, Palgrave & Co., 28 Victoria Street.

Re-erection of Crosby Hall, in Cheyne Walk, Chelsea, by University and City Association of London, Ltd.

Billiard hall, High Street, Clapham South, for Temperance Billiard Halls, Ltd.

W.—Alterations, &c., London Pavilion, Piccadilly Circus. Architects, Wylson & Long, 16 King William Street, E.C.

Extension of Paddington Technical Institution. T. J. Bailey (Education), Architect to L.C.C., Victoria Embankment.

Adaptation of premises, High Street, Notting Hill, for branch of London, City and Midland Bank, 5 Threadneedle Street, E.C.

Improving and enlarging Barrow Hall Road School, St. John's Wood (£14,973). Builders, G. E. Wallis & Sons, Ltd., 1 Albemarle Street, W.

PROVINCES.

ABERDEEN.—New dock and reconstruction of wharves in Albert Basin (£85,000). Engineer, Aberdeen Harbour Board.

CHELMSFORD.—New school (800 places), Trinity Road. J. H. Nicholas, secretary, Essex Education Committee.

CHRISTCHURCH (HANTS).—Proposed infirmary. Clerk to the Board of Guardians.

EAST HAM.—Residence at hospital for Medical Officer of Health. A. H. Campbell, surveyor to Town Council.

ECCLES.—Tenders are invited for wiring and fitting for electric lighting of buildings belonging to the Cleansing and Scavenging Committee. Particulars from the Town Clerk, and tenders by November 14th.

EDINBURGH.—Tenders are invited for an electrical installation at the Cattle Market, Gorgie. Particulars from the Borough Electrical Engineer (fee, one guinea, returnable), and tenders by November 14th.

Police station, MacLeod Street (£6,000). J. Sim, surveyor, Town Council.

EPSOM.—Further extensions to Manor Asylum (£15,973). Engineer, W. C. Clifford Smith, Asylums Committee, L.C.C., 6 Waterloo Place, S.W.

GATESHEAD.—Lunatic Asylum, West Dudds Estate, near Stannington. City architect, N. P. Pattinson.

GLASGOW.—School, &c. Hopehill Road, for Directors of Houses of Refuge and Reformatory and Industrial Schools.

Extension to Dead Meat Market for Glasgow Corporation. A. B. McDonald, surveyor to Town Council.

New Pavilion Hospital at Yorkhill, for the Royal Hospital for Sick Children, Glasgow.

HULL.—Art Gallery to the Public Hall. City Architect, Joseph H. Hirst, Town Hall, Hull.

ISLEWORTH.—Church Hall, Spring Grove. Architect, J. E. Franck, 11 Pancras Lane, E.C.

LANCASHIRE.—Buildings on asylum estate at Whittingham for Asylum Board. H. E. Clare, Clerk, Preston.

LEAMINGTON.—New chapel at Midland Home for Incurables. The Secretary.

LEYTON.—Extension of office accommodation at Town Hall (8,600). Surveyor, W. Dawson, Town Hall, Leyton.

LONDONDERRY.—Municipal Buildings (£5,000). W. J. Robinson, Surveyor to City Council.

MONMOUTHSHIRE.—School (£5,137). H. S. Gustard, clerk to the County Education Committee, Newport.

PONTYPRIDD.—School, Maesycoed (£12,091). P. R. A. Willoughby, Surveyor to Urban District Council.

ROTHERHAM.—Cold storage, for Markets Committee. G. Jennings Surveyor to the Council.

High-grade school at South Grove. Architect, D. B. Jenkinson, c/o Rotherham Town Council.

SHEFFIELD.—Cookery centre at Peripathetic Science Department, Townhead Street, for Education Department.

SOUTHAMPTON.—Additions, Portarlington College Place. Architect, A. A. Burnett, 2 High Street.

Adapting premises 48 Payne's Road for police station (£960). J. A. Crowther, Borough Engineer.

SUNDERLAND.—Mortuary at Ryhope. T. Young, Surveyor to the Rural District Council.

TYNEMOUTH.—Proposed swimming bath (£3,000). J. F. Smillie, Surveyor to Town Council.

WATFORD.—Co-operative stores (£11,000). Architect, C. P. Ayres, 6 The Parade, High Street. Builders, Clark Bros., Fearnley Street.

WIGAN.—Additions to cardroom of Trencherfield Mill, off Pottery Road, for W. Wood & Sons, Ltd.

WIMBLEDON.—Empire Theatre of Varieties. Architect, T. V. Woodhouse, 16 Hound Street, West Bridgeford, Nottingham.

Royal Society Medals.—Among the Royal Society medals, the awards for which have just been announced, is one to Prof. Eugen Goldstein, for his discoveries on the Nature of Electric Discharges in Rarefied Gases.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA.—An order for transformer station equipments in connection with the Adelaide tramway system has been placed with the Australian agents of the Allgemeine Elektricitäts Gesellschaft. Fourteen tenders were received from different parts of the world. Transformation will take place from 11,000 volts three-phrase to 600 volts continuous.

The whole of the first batch of tenders for the supply of wireless telegraphy installations to the Federal Government, namely, those to be provided for the northern and western coasts, were, says the *Australian Mining Standard*, rejected as not complying with the specifications. The tenders for the same work at Launceston or Georgetown, King Island, Flinders Island, and Melbourne, or some point on the coast of Victoria, originally called for August 26th, are not due now until December 9th, and much will depend upon the manner in which tenders come in for those posts, whether fresh tenders will be called for the northern installation, or whether the Government will undertake the work on its own account.

The Commonwealth Postmaster-General is, owing to the fact that the tenders recently received for wall telephones and parts were not satisfactory, making inquiries to ascertain whether a departmental factory should be established for their production, and also for telephone wire. The requirements of the Telegraph and Telephone Department amount to 357 tons per annum.

CARLISLE.—The tender of Messrs. Pratchett Bros., of Carlisle, for the erection of elevating, conveying, and storage plant at the Electricity Works has been accepted, subject to the sanction of the Local Government Board, to borrow £1,000, the cost of the works. The works include a coal bunker, foundations, wiring, and motor and counter gear for measuring fuel, &c.

ENNISKILLEN (County Fermanagh).—Three companies have laid tenders before the local authorities for an electric lighting scheme, and the matter is to be finally settled at a meeting, which will be held at an early date.

EPSOM.—Messrs. Pritchetts & Gold have received an order for a new battery of 210 cells.

GLASGOW.—The Town Council have accepted the tender of W. C. Yuille & Co. for mica insulated bolts.

KINGSTON.—The tender of Siemens Bros. & Co., Ltd., has been accepted for the supply of five lengths of cable at £213 3s.

LONDON: *London County Council.*—In connection with the electrification of further tramways consisting of about 18¼ miles of single track, the Highways Committee recommend that an offer by the Frodingham Iron & Steel Co., Ltd., amounting to £13,017, for the supply of slot rails and conductor tee rails be accepted. An offer by Messrs. Bolchow Vaughan & Co., Ltd., at £8,150 for the supply of track rails and fastenings, is also recommended for acceptance.

The following tenders have been received for the erection of the Norwood tramways car-shed :—Charles Wall (recommended), £24,723; Leslie & Co., £25,860; J. Mowlem & Co., £25.897; Rowley Brothers, £26,807; Kerridge & Shaw, £26,824; Holloway Brothers (London), £27,000; Patman & Fotheringham, £27,283; McCormick & Sons, £27,567; J. & C. Bowyer, £27.618; Henry Lovatt, £27.660; E. Lawrance & Sons, £27,694; Foster & Dicksee, £28,588; F. & G. Foster, £30,286.

Bermondsey.—The following tenders have been received for one set of suction and delivery valves, and seats for boiler feed pump at the generating station :—J. P. Hall & Sons, £5 5s.; Dewrance & Co. (accepted), £5 12s.; W. A. Crips & Sons, £5 16s.

Camberwell.—The Guardians have accepted the tender of Leslie Miller, 93 Hatton Garden, E.C., to repair the X-ray apparatus, at £15 8s.

Hammersmith.—The Council has placed an order with the General Electric Co., Ltd., at £117 and £22 for two low-tension switchboards required in connection with the Council's sub-station at the works of the Wolfram (Tungsten) Metal Filament Lamps, Ltd.

Marylebone.—The Council has accepted the tender of C. A. Parsons & Co. for the supply of two sets of carbon brushes and gear at £40 12s. each.

Stepney.—The Council has accepted the following tenders :—For temporary switchgear required to connect up the Poplar supply : Johnson & Phillips, £93 5s. For motor fans and air ducts in connection with Blyth's Wharf extension scheme, the following tenders have been received :—Matthews & Yates, £628 (incomplete), alternative £744; Sturtevant Engineering Co., £731 17s. 6d.; Davidson & Co., £660, alternative (accepted) £690; Babcock & Wilcox, £684, alternative £722; Underfeed Stoker Co., £741.

Stoke Newington.—The tender of Messrs. W. T. Henley's Telegraph Works Company at £1,372 has been accepted for the supply of cables, to connect the new generating station adjoining the refuse destructor with the existing sub-station, which is supplied by the North Metropolitan Electric Power Supply Company. Other tenders were Messrs. W. T. Glover & Co., £1.556; British Insulated & Helsby Cables, £1,413; Callender's Cable & Construction Co., £1,628.

Wandsworth.—An order has been placed with the Brush Electrical Engineering Co. to supply and fix an 18-hour, 2,500-c.p. plain arc lamp, bracket, and lowering gear outside the Tooting Baths for the sum of £23 10s.

UNITED STATES.—The *Times* correspondent at New York states that the Pennsylvania Railroad Co. has awarded the Westinghouse Electric Co. a large contract in connection with the electrical equipment required for the New York and Long Island new terminals, covering the next two years, the *minimum* estimates for which were over £1,000,000.

COMPANIES' MEETINGS AND REPORTS

BRITISH COLUMBIA ELECTRIC RAILWAY.—The report for the year ended June 30th last states that the gross receipts show an increase of $525,218, or 36 per cent., and the net earnings an increase of $208,749, or 30 per cent. over those of the preceding year. The net profit for the year, after deducting renewals and maintenance, employees' bonus, and amount added to capital amortisation fund, amounts to £154,223, which, with the balance brought forward of £3,481, makes £157,704. Interest on debentures and debenture stock to June 30th, 1908; dividends already paid—on 5 per cent. cumulative perpetual preference stock for the year ended June 30th, 1908; on preferred ordinary stock for the year ended June 30th, 1908; and on deferred ordinary stock for six months to December 31st, 1907—together absorb £83,730, leaving available for further distribution and reserves £73,973. The directors recommend a dividend on the deferred ordinary stock, including the recent issue of 100,000 deferred ordinary shares of £1 each, at the rate of 8 per cent. per annum for the six months to June 30th, 1908, making 8 per cent. for the year: to transfer to reserve fund (increasing this fund to £140,000) £49,000, and to carry forward £4,973.

CAPE ELECTRIC TRAMWAYS CO.—The report for the year ended June 30th shows a balance of £8.823 after providing for debenture interest and redemption of debentures. The number of passengers carried during the year in Cape Town was 14,742.155, and in Port Elizabeth 3,561,211. The receipts in Cape Town were £120,910 and £37,048 respectively, the figures for the previous year being £131,594 and £36,696. The report calls attention to the fact that in addition to suffering severely on account of the general trade depreciation, and shrinkage of the population in both towns, the company's business has suffered from the persistent ruinous competition from the Government and the Seapoint Municipality, which affects the Seapoint section of the company's system.

CUBA SUBMARINE TELEGRAPH CO.—At the half-yearly meeting last week, the report and accounts given in our issue for October 22nd were adopted. In moving the adoption of the report, the chairman said that the half year covered by the accounts had not been a very exciting one, there having been no earthquake in the West Indies, or any such circumstances to cause a special increase in traffic. At the same time affairs in Cuba had been very dull, and owing to the poor sugar crop there had been less traffic for the railways, and less traffic in the shape of messages for the company's cables to deal with.

DEUTSCHE GASGLUHLICHT - AKTIENGESELLSCHAFT (AUERGESELLSCHAFT) BERLIN.—The report for the year 1907-8 shows a net profit of about £171,400, as against £61,260 in the previous year. At the general meeting, which will be held on December 1st, 1908, a dividend of 35 per cent. on the total share capital of £330,000 as against 22 per cent. last year on the then total share capital of £195,000, will be recommended. The reserve fund now stands at £260,000, or about 80 per cent. of the share capital. The meeting will also be asked to sanction the issue of further 5 per cent. preference shares to the value of £330,000, in consideration of the continued expansion of the undertaking. These shares will not be issued at once, however. This company, it will be remembered, manufacture, besides incandescent gas mantles, the well-known Osram lamps.

DOUGLAS SOUTHERN ELECTRIC TRAMWAYS CO.—At the annual meeting on Thursday, the report and accounts were adopted. The company's season consisted of 115 days against 125 days last season, the total receipts being £5,012, against £5,613 last year. The number of passengers carried were 206,994, compared with 231,664. After deducting the necessary items, the net profit was £1,479, to which is added £179 balance of last year, giving a total balance available for depreciation of £1,658, against £1,692. A dividend of 5½ per cent. upon the preference shares has been declared, and a balance of £229 carried forward.

EASTERN EXTENSION, AUSTRALASIA & CHINA TELEGRAPH CO.—The report for the half-year ended June 30th, 1908, states that the gross receipts amounted to £290.295,

Digitized by Google

against £304,367 for the corresponding half-year of 1907. The working expenses, including £21,156 for maintenance of cables, absorb £150,889, against £155,930 for the corresponding period of 1907, leaving £139,405. From this is deducted income-tax payable in England, expenses in connection with the International Telegraph Conference in Lisbon, and interest on debenture stock, leaving £120,387. After adding £20,389 brought forward, there is an available balance of £140,777. Two quarterly interim dividends of 1¼ per cent. each have been paid for the half-year, leaving £65,777 to be carried forward. The meeting is on Tuesday.

EASTERN TELEGRAPH CO.—The report for the six months ended June 30th, 1908, shows revenue amounting to £568,442, from which are deducted £208,071 for the ordinary expenses, and £53,098 for expenditure relating to maintenance of cables, depreciation of spare cable, sundry differences in exchange, and income tax payable abroad. Adding £35,794 brought from the preceding account, there is a total available balance of £343,066. After providing for income tax payable in England, interest on mortgage debenture stock, and for two quarterly dividends on the preference stock, which in all absorb £82,301, there remains a balance of £260,765, out of which the directors have placed £7,000 to the reserve fund for maintenance ships, £100,000 to the general reserve fund, and have allocated £100,000 to meet the two interim dividends of 1¼ per cent. each on the ordinary stock, the balance of £53,765 being carried forward to the next account. The meeting is on Wednesday.

EDISON & SWAN UNITED ELECTRIC LIGHT CO.—At the ordinary general meeting on Thursday, the report and accounts, given in our last issue, were adopted. Mr. H. Wolfenden, chairman of the company, presided, and stated that it was natural that the considerably reduced profit, as the result of the year's trading, was a position hardly agreeable to the shareholders, but that there was little cause for dissatisfaction when the result was analysed. Apart from a year of depression in the trade generally, and the electrical trade in particular, there had been the special effect resulting from the increasing use of metal filament lamps, which were being installed on account of their economy in consumption of current where long hour burning was needed. In order to extend the area of electric lighting, to counteract this effect, two factors were needed, in addition to an economical high-efficiency lamp, namely, a cheap form of house installation and a more simple method of charging for electrical energy. A cheaper form of house installation was being used on the Continent, and was available for use in this country, but the rules of the fire insurance companies would not allow of it. Under the circumstances, he suggested that the insurance companies might be approached with a view to a frank reconsideration of their rules in this respect, and this might be brought about through the medium of the Institution of Electrical Engineers and other societies interested in the industry. Methods of charging, he said, he need not discuss at the moment, because electrical engineers were fully alive to the needs in this direction, and were giving it their consideration. With regard to the company, they were retaining their carbon lamp factories, but were adding a new factory for metal filament lamps, which they were now producing in some quantity. He claimed that they were the first English firm to produce metal filament lamps upon a commercial scale, and that they were the largest producers at the present time in England. Furthermore, this has all been done without the purchase of any patents. The report and accounts having been adopted, Sir Joseph Swan, F.R.S., and Mr. H. Wolfenden were re-elected directors.

ELECTRIC SUPPLY CORPORATION.—At the annual meeting on Thursday, the report and accounts which were given in our issue of October 22nd were adopted. The chairman, Major C. Heaton-Ellis, stated that very shortly the company would have to ask for increased borrowing powers.

MONTE VIDEO TELEPHONE CO.—The report for the year to July 31st records a substantial increase in the number of consumers, and in gross revenue, but owing to an increase in the rate of wages, to damage caused by storms and the removal of lines necessitated by the introduction of electric traction, the working expenses have more than absorbed the increased receipts. After providing for such exceptional expenditure and ordinary working expenses in Monte Video and London, there is a net profit of £19,400 against £20,383 for the previous year. After deducting the interim dividend already paid, transferring £6,000 to reserve fund and £5,000 to reserve for renewal of plant, a final dividend of 2½ per cent. on the preference shares, and 3 per cent. on the ordinary shares, making 5 per cent. and 6 per cent. per annum respectively, is recommended, carrying forward £2,796.

At the meeting on Friday, the report and accounts were adopted. Mr. C. Lock, who presided, stated that he hoped there was no truth in the reports in certain newspapers that the Government proposed to nationalise the telephone system.

NEW ST. HELENS & DISTRICT TRAMWAYS CO.—The report for the year to June 30th shows a profit of £1,689, compared with £1,068 for the previous year. After deducting the debit balance from last year there is a balance of £1,477 available. A dividend on the preference shares of 1½ per cent. per annum is recommended, carrying forward £278.

NORWICH ELECTRIC TRAMWAYS CO.—The report of the directors for the year ended June 30th last shows a profit of £6,129; to this sum has to be added £181 interest and transfer fees received, bringing the gross profit for the year up to £6,310. Taking into account the sum brought forward from the previous year, after paying the dividend and providing for the reserve, the amount standing to the credit of profit and loss account is £6,470. Deducting from this amount the sum of £2,640, 4 per cent. interest on the mortgage bonds for the year, there remains a sum of £3,830. The directors recommend that the sum of £500 be placed to "reserve fund" account; that a dividend of 1¼ per cent., less income tax, be paid on the shares of the company for the year ended June 30th, 1908, and that the balance of £30 be carried forward. Comparing the accounts with those for the year ended June 30th, 1907, the revenue has decreased by £1,692, and the expenses have increased by £44, showing a decrease of £1,736 in the profits. The directors call attention, however, to the fact that the profits have been arrived at after charging to revenue the following extraordinary expenses, namely: arbitration law costs, £1,185; repairs carried out under arbitration, £427; repaving Unthank Road, £643, a total of £2,255. There is a further liability in respect of arbitration law costs, estimated at about £1,000, yet to be dealt with. The number of passengers carried was 7,190,361, a decrease of 377,845 on the previous year, and the number of car miles run was 1,049,175, as against 1,081,221. At the meeting on Friday the report and accounts were adopted.

RIO DE JANEIRO LIGHT & POWER CO.—The report for the year ended December 31st, 1907, states that the company was originally organised with a capital stock of $25,000,000 and a first mortgage bond issue of $25,000,000. Further large expenditures being necessary, the Board on March 29th, 1908, authorised the issue of £3,500,000, or 88,060,000 frs., of 50-year 5 per cent. mortgage bonds, dated April 1st, 1908. Notwithstanding the financial crisis, the construction work in Rio has been continued without interruption, largely with funds provided through loans from banking institutions. The company has sold 22,500,000 frs. of the new issue in Paris and in Belgium, and a further £900,000 in England. The proceeds are being used in the payment of the floating debt, the completion of the work in hand, and further construction. The company still has in the treasury about £1,700,000 of this second issue, the proceeds of which will be applied to the electrification of the tramways, the reconstruction of the gas works, the extension of the telephone, light and power systems, and other works of construction.

ROSARIO ELECTRIC CO.—At the general meeting last week, the report and accounts given in our issue for October 15th were adopted.

WESTERN TELEGRAPH CO.—The report for the half-year ended June 30th, states that the revenue amounted to £353,185 and the working expenses to £115,485. After providing £16,000 for debenture stock interest and £5,241 for income-tax, there remains a balance of £222,432, including £5,973 brought forward. A quarterly interim dividend, amounting to £31,190, has been paid, £110,000 transferred to the general reserve fund, £5,000 to the maintenance ships' reserve fund, £10,000 to the marine insurance fund, and £10,000 to the land and buildings depreciation fund. The directors now recommend a final dividend of 3s. per share, making, with the interim dividends, a total dividend of 6 per cent. for the year, also the payment of a bonus of 2s. per share, both free of tax, which together will amount to £51,983, leaving £4,260 to be carried forward.

WESTERN UNION TELEGRAPH CO.—The gross receipts of the year to June 30th, 1908, are less by $4,274,194 than the revenue of the previous year, and, as the expenses have only been reduced by $1,352,981, there is a net loss on the revenue account, compared with the previous year, of $2,921,213. This result is attributed to depression in business and to the strike of operators which commenced early in August, and lasted until November 7th, 1907.

X ACCUMULATOR CO.—The report states that the amount of working capital originally subscribed was insufficient for the company's purposes, and, after giving particulars of the various items of expenditure, the Directors state that they deem it advisable to take the necessary steps to voluntarily liquidate the Company.

ALLGEMEINE ELEKTRICITATS-GESELLSCHAFT, BERLIN.—The report for the year ending June, 1908, shows very satisfactory results. A dividend of 12 per cent., the same as for the previous year will be proposed at the general meeting, which is to be held on December 5th.

Electrical Industry in Belgium.—An American Consular report states that there are several underground tramway lines in Brussels, worked by two different companies, which employ their own staffs for the laying of the lines. Work for laying the underground telephone lines is done on the contract system. Underground lines are gradually replacing the suspended lines. A concession for electrical tramways has just been granted in Namur. Electric light and power plants are extending in the Brussels Consular district. Projects are made to build plants in Anderlecht, Etterbeek, Auvelais, Montaigu, &c. There are 39 plants in Belgium manufacturing electrical machinery, supplies, &c., in which about 5,900 workmen are employed.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f., quoted on Tuesday night, was £64 to £64 10s. per ton (last week £63 to £63 10s.).

ARCOFLAME LAMP.—We are informed by Messrs. J. & H. Grevener that in view of suggestions that their "Arcoflame" lamp is an infringement of the "Bremer-Westinghouse" patents, they are prepared to guarantee all purchasers of "Arcoflame" lamps against any loss which they may incur at the hands of any persons who take proceedings against them on account of their purchasing or dealing in "Arcoflame" lamps.

CHANGE OF ADDRESS.—Messrs. Robertson & Adams, consulting engineers and electricians, have now completely removed from 60 to 52 St. Enoch Square, to where all communications, catalogues, &c., should be sent in future.

DISSOLUTION OF PARTNERSHIP.—The partnership between J. R. Scholes and T. Dawson, carrying on business as electrical and mechanical engineers, under the title of the Union Engineering Co., at Livesey Fold, Darwin, has been dissolved.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—A meeting of the St. Helens Cable Co., Ltd., will be held at the offices of Messrs. Oppenheim, Windle Chambers, St. Helens, Lancs., on December 3rd, at 2.30 p.m., for the purpose of hearing the liquidator's account of the winding up.

MISCELLANEOUS CITY NOTES

CITY OF BUENOS AYRES TRAMWAYS CO.—A dividend of 1s. 3d. per share, less income tax, has been declared for the three months ended September 30th.

MEXICAN LIGHT & POWER CO.—In reference to the breaking off of negotiations for the amalgamation of this company with the Mexico Tramways Co., a committee of influential shareholders has been formed to represent the views of those who desire to see the amalgamation carried through. Steps have been taken to hold a special meeting of the shareholders during November, in order that some agreement may be arrived at on the question of the lease, so that the shareholders may be guided as to their vote at the special meeting on December 3rd, which the directors have convened, to pass resolutions for increasing the capital of the company.

WESTERN TELEGRAPH CO.—The directors have, after transferring £110,000 to the general reserve fund, £5,000 to the maintenance ships' reserve fund, £10,000 to the marine insurance fund, and £10,000 to the land and buildings depreciation fund, decided to recommend a final dividend of 3s. per share, making with previous distributions a total dividend of six per cent. for the year ended June 30th, 1908, and also the payment of a bonus of two shillings per share, both free of income tax. The balance of the account is carried forward.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. M. O'Neill has been appointed electrical engineer to the Balla Shire (V.) Council.

An installation assistant is required at Belfast (see an advertisement).

Mr. A. H. Unwin, manager of the Rosario Electric Light Co., has, says the *Review of the River Plate*, left for London to consult with his directors concerning the acquisition of more machinery to meet the ever-growing demand upon the station.

Electric Traction on the Italian State Railways.—According to *Elektrotechnik und Maschinenbau*, the favourable results obtained on the Valtellina and Milan-Porto-Ceresio railways have induced the Italian Government to introduce electric traction, on the three-phase system, on nine further main-line sections, with a total length of 135 miles. The work is to be carried out within three years. The most important lines are that between Genoa and Bussala, with a total length of about 18 miles, and the 2½ mile line through the Giovi tunnel. These two lines are to be completed by the middle of May, 1909. The rolling-stock will be supplied by the Westinghouse Co., and the overhead equipment by Brown, Boveri & Co. Each train, consisting of 21 double cars, and weighing 420 tons, will be hauled by two 1,600 h.p. three-phase locomotives. Energy will be supplied from a large steam turbine power station in the Genoa docks, which has at present two 5,000-kw. units installed. These machines generate at 13,000 volts, 15 cycles. A third unit will be installed in a short time. The contact line pressure is to be 3,000 volts. Speed variation for the locomotives, each of which will carry two 800 h.p. asychronous three-phase motors, will be obtained by cascade connections. The regenerative capacity of the three-phase system will be taken advantage of to a large degree, as there are several heavy gradients on the lines to be electrified.

COMPANY MORTGAGES

SWITCHGEAR CO.—An amended return re second debenture, dated July 7th, 1908, securing £2,000, has been registered. Original return gave address of holders (Cowans, Ltd.), as 4 Queen Victoria Street, E.C., instead of Victoria Works, Wilfred Street, Salford, Manchester.

The following relate to total amounts outstanding on July 1st, in respect of mortgages, &c., created prior to the date, and required to be registered under Section 12 of the Companies Act, 1907:—

MADEIRA ELECTRIC LIGHTING CO., LTD.—Debentures, dated 1896 and 1897, securing £15,000.

MORLEY ELECTRICAL ENGINEERING CO., LTD. (Stanningley)—Amount, £3,000. (No particulars.)

NEW COMPANIES

AERO FIRE ALARM.—This company was registered on October 26th, with a capital of £25,000 in £1 shares, to acquire the British rights in an invention or inventions known as Aero Fire Alarm, and the business carried on at 66 Cheapside, E.C., as the Aero Automatic Fire Alarm Co., to adopt an agreement with G. L. Smith and W. Rattray, and to carry on the business of fire alarm and appliance manufacturers, electrical engineers, &c. Registered office: 66 Cheapside, E.C.

CAMBAO CARTROAD CO.—This company was registered on October 16th, with a capital of £100,000 in £10 shares, to acquire concessions granted by the Government of Colombia for the reconstruction, maintenance, and improvement of the Cambao Cartroad, and to reconstruct, maintain, improve, and equip the said road or any parts thereof with all buildings, works, telegraphs, telephones, and appliances ancillary thereto, and to adopt an agreement with T. G. Ribon. Minimum cash subscription, 8,000 shares. The number of directors is not to be less than two nor more than five: the first are to be appointed by the subscribers. Qualification, £1,000. Remuneration, £100 each per annum (£200 for the chairman). Registered office, Finsbury Pavement House, E.C.

EASTON LIFT CO.—This company was registered on October 20th, with a capital of £10,000 in £1 shares to carry on in the United Kingdom or elsewhere the business of manufacturers of and dealers in lifts, elevators, cranes, hoists, and lifting machinery of all kinds, hydraulic, electrical, mechanical, and general engineers, electricians, suppliers of electricity, iron-founders, &c. The subscribers are:—R. A. Smith, Palace Chambers, Westminster, consulting engineer; L. Phillips, 22 Pickwick Road, Dulwich, S.E., engineer. Private company. The number of directors is not to be less than two nor more than five: the first are R. A. Smith and L. Phillips. Registered by Bristows, Cooke, and Carpmael, 1 Copthall Buildings, E.C.

NEW PUBLICATIONS

"Outlines of Electrical Engineering." By Harold H. Simmons. (London: Cassell & Co., Ltd.) 21s. net.

The Architects' Directory: Travellers' Edition, 1908. Edited by A. C. Freeman. (London: British Manufactures Publishing Co., Ltd.) 5s.

"Science Abstracts," October, 1908. Section A, Physics. Section B, Electrical Engineering. (London: E. & F. N. Spon.) 1s. 6d. each.

Electric Power in Bolivia.—The British Vice-Consul in Oruro, Bolivia, gives the following information with regard to the use of electric power in tin mines in the district. Mining plant, including drills, crushing mills, and aërial ropeways, is being continuously erected, and there is a considerable demand for electric power. A German firm has an engineer in the district, who is preparing a scheme for utilising the water-power of the rivers on the eastern slope of the Tres Cruces range, some 90 miles distant from Oruro. The immediate demand is estimated at about 3,000 h.p. With regard to lighting, the mines work day and night, and therefore there is a large demand; the town of Oruro is lighted by a private company, the charge being 1/6d. per unit, but most of the private houses are lighted by petroleum.

The Vice-Consul in Sucre reports that a German company obtained a municipal concession in 1906 for the public lighting of that city for 30 years, and that the power station is now being constructed. Owing to the delay in the delivery of the machinery, the time contract has not been fulfilled, and a large portion of the municipal subsidy of £2,000 will be forfeited. The station is being erected, eight miles distant from the city, on the River Cachimayo. The same Consul states, with regard to electric lighting and power in Potosi, that a scheme is now on foot for the erection of a power station on the River Pilcomayo, 22 miles from Potosi, at a cost of £58,000. The available power is estimated at 600 h.p., of which 450 h.p. would be used for power in the tin mines.

SUMMARY

Professor W. E. Ayrton died on Sunday morning last, at the age of 62, after an illness of about three weeks. (Page 634.)

The following books are reviewed in this issue:—"Natural Sources of Power," by R. S. Ball; "Electric Furnaces," by Wilhelm Borchers, translated from the German by Henry G. Solomon; "The Slide Rule," by Charles N. Pickworth; and the twenty-sixth edition of Molesworth's Pocket Book of Engineering Formulæ. (Page 635.)

The Paper on turbo-alternators, read by Dr. M. Kloss at the Manchester Local Section of the Institution of Electrical Engineers last week, emphasised some of the leading differences between slow-speed and high-speed alternators in regard to the necessity for artificial ventilation, the fact that such close inherent voltage regulation was not attainable with turbo-alternators as with slow-speed machines, and the influence of the amount of margin allowed in the specification of the rated load factor on the price of the machine. (Page 637.)

We give an abstract of an article which appeared recently in a German contemporary, emphasising the importance of measuring the no-load losses of a continuous-current machine with the brushes in the neutral position, when this measurement is to be used for estimating the efficiency of the machine at full load. (Page 638.)

A new aluminium works, which is designed for an eventual output of five tons of aluminium per day, has been almost completed by the Aluminium Corporation, Ltd., near Conway, in North Wales. Continuous current for the electric furnaces is derived partly from a 4,000 kw. high-fall water power plant in the works driven by Pelton wheels and utilising the waters of neighbouring lakes, which render a fall of 1,000 ft. available, and partly from motor-generators supplied through a 20,000-volt three-phase transmission line 13 miles in length from the water power generating station of the North Wales Power & Traction Co., near Snowdon. (Page 639.)

Under "Electrometallurgy and Electrochemistry" we give some notes on the origin and development of the Roechling-Rodenhauser combined induction and electrode furnace. The substitution of two 250 h.p. Stassano furnaces for a battery of crucible furnaces in a large German steel works has been attended with considerable success; we give some figures for the costs of production, which have been published by these works, together with some notes on the management of the furnaces. (Page 645.)

Digitized by Google

A NEW form of "magazine" fuse has recently been brought out which enables a circuit to be re-fused four times by merely turning a milled head at the bottom of the case. (Page 646.)

A NEW pattern of portable rheostat especially suitable for use when testing meters on a consumer's premises is described. It consists of several resistance units, any number of which can be placed in parallel across the full pressure. (Page 646.)

Two large slow-speed double flywheel generators have been installed at the Rombacher smelting works in Germany. Each generator consists of two separate armatures mounted on a common spider, and two separate field systems. Particular interest attaches to the method whereby the commutator lugs and the equipotential windings are supported on the frame of the machine. The machines are coupled to 1,200 h.p. gas engines, running at 120 r.p.m. (Page 646.)

THE report of the Special Committee appointed by the Tramways and Light Railways Association to consider the whole question of tramway brakes is a valuable contribution to the literature of the subject. The general requirements of brakes are considered, prevailing practice is dealt with, and after a detailed examination of a number of patterns, their suitability to varying conditions is discussed. A number of recommendations are made. Where service stops are frequent, one power brake and one hand brake are recommended. The importance of proper sanding gear is emphasised, and the medical examination and proper training of drivers are insisted on. (Page 647.)

AN article by J. E. NOEGERATH in an American contemporary gives some particulars of several acyclic generators ranging up to 2,000 kw. in output, which are in actual operation, with some notes on the construction and running of machines of this class. (Page 649.)

A PAPER read before the Birmingham Association of Mechanical Engineers on Saturday last by Mr. C. A. ABLETT dealt with the application of electric driving to brass and copper rolling mills. Saving in space, increased output, freedom from breakdown, and easy extension were amongst the advantages claimed for electric driving. In the discussion which followed it was mentioned that before the end of the year 4,000 h.p. of rolling-mill motors would be connected to the Birmingham Corporation mains. (Page 650.)

MAJOR PRINGLE'S report on the fire which occurred at the beginning of last month in a train at the Swiss Cottage station of the Metropolitan Railway states that the origin of the fire was not electrical, but makes some comments on the structure of the carriages. (Page 650.)

AMONG the specifications published by the Patent Office on Thursday last is one by E. M. PRESTON and A. E. KENNARD for an improvement in the "Stone" system of train-lighting, which renders the gear independent of the direction of travel. A method of protecting the small transformer of a series transformer distribution system is patented by A. F. BERRY, and a specification by JOHNSON & PHILLIPS, LTD., and C. F. TUBBS relates to a flame arc lamp with two or more pairs of carbons burning in series. V. A. FYNN has a specification describing a single-phase traction system, in which a motor-generator on the locomotive supplies asynchronous polyphase motors; and another by O. GRAETZER covers a construction of cable- or wire-connector in which screw terminals are avoided by the use of a spring-grip action. A method of mounting the end connections of the armature windings of high-speed continuous-current machines is described in a specification by the PHŒNIX DYNAMO MANUFACTURING CO. and R. POHL; and another communicated by SIEMENS & HALSKE AKT.-GES. refers to the manufacture of metal filament lamps. Short abstracts of these are given in our Patent Record. (Page 651.)

SOME notes are given on the equipment of a large steel works in America. (Page 653.)

THE possibilities of the trackless trolley system are under consideration at Aberdeen and Malvern.—Arrangements for the purchase of the Bath municipal electricity undertaking by a company formed by Mr. E. Schenk are now completed.—An international exhibition is to be held at Brussels in 1910.—The Dudley Corporation are making arrangements for the purchase of the tramways in their district, and for their lease to the British Electric Traction Co.—A scheme for tramways between Halifax and Huddersfield is being considered by the West Yorkshire Tramways Co.—The Hastings Corporation have at last agreed unconditionally to the running of the tramways of the local company on Sundays.—An agreement has been arrived at between the City Corporation and the Highways Committee of the London County Council for running tramways to Liverpool Street.—The London County Council has been asked, but has refused, to deal with the question of the expenses of delegates from the London electricity undertakings at electrical and other technical conferences.—The Tramways Committee of the Oxford Corporation, whilst inclined to agree to the adoption of a combined conduit and overhead trolley system of tramways in place of the surface contact system originally contracted for by the National Electric Construction Co., refuses to assent to a reduction in the rent payable by the company. (Pages 653-655.)

THE sum of £25,000 is to be spent upon electrical extensions at Port Elizabeth (South Africa). A condensing plant is to be installed at Bridlington. Local Government Board inquiries have been held as follows: —Hull (£24,000), St. Helens (£10,426), Tynemouth (£4,251). Electrical stores are required by the Great North of Scotland Railway Co., the Wakefield and District Light Railway Co., and the Chatham Borough Surveyor's Department. Extensions amounting to £17,000 are contemplated by the Christchurch (N.Z.) Corporation. (Pages 655-656.)

SUBSCRIPTIONS have been invited during the week for an issue of 85,000 preference shares of £1 each in the Rees Roturbo Manufacturing Co., Ltd. In connection with the proposed amalgamation between the Mexican Light and Power Co. and the Mexican Tramways Co., the latter has guaranteed an issue of about £1,000,000 of debentures either for its own purposes or for the combined undertaking, should the amalgamation be carried through. (Pages 656-667.)

SOME British-made porcelain insulators are described on page 658.

IT is anticipated that the consideration of the London and District Electricity Supply Bill will be concluded before Sir LUKE WHITE'S Committee of the House of Commons this week. Since our last issue considerable progress has been made with the case for the opposition, among the local authorities who have been heard being Marylebone, Battersea, Croydon, Woolwich, West Ham, St. Pancras, Shoreditch, Southwark, Hornsey, Finchley, Chiswick, Bexley, Beckenham, Stepney, and Hammersmith. On Friday the opposition of the eight companies, who are promoting the London Electric Supply Bill, was opened, and evidence was given by Mr. C. P. SPARKS and Mr. J. S. HIGHFIELD, in addition to the Secretary of the City of London Co., and the Manager of the County of London Co. All the opponents doubted the need of a new power company, in view of the magnitude of the supply now being given by the existing authorities in relation to the possible demand. With regard to the railway load, upon which the promoters set considerable value, the opinion of the engineers to the existing companies is that separate plant would have to be installed. Owing to the character of this load, the supply should not be mixed up with the general load (Page 659.)

THE September Circular of the Tramway and Light Railways Association, published last week, consists of the report of the Special Committee on Tramway Brakes, which was appointed in the autumn of 1906, after a suggestion by Col. YORKE in his report on the Highgate accident that the tramway associations should investigate the whole subject with a view to ascertaining how brake failures could be eliminated from the causes of tramway accidents. The Committee's report shows that it took the matter seriously, and deals with the question systematically, beginning with a discussion of the functions required from brakes and the means available for filling them. This discussion shows that the most important factor in braking action is the available coefficient of friction, a factor which varies in value with the state of the rails. One of the most valuable results of the Committee's work is an experimental investigation of the values of coefficients of friction applicable to brakes under different conditions. The experiments are not exhaustive, but some important deductions to be drawn from them are likely to lead to certain modifications in braking equipment, whilst they indicate the direction which further experiments should take. We believe that these experiments are the first which have been made to determine coefficients of friction under conditions applicable to braking problems, since the well-known tests of Westinghouse and Galton thirty years ago. In addition to these tests a large number of measured braking stops are recorded in tables and curves, which show what can be done with the brakes tested. The Committee heard evidence from a large number of tramway managers, engineers, manufacturers, and some inventors, and has drawn up a concise description of most of the tramway brakes on the market. and their special advantages and disadvantages, which is a useful record of the present state of the art, and should not only assist in the selection of brakes, but also suggest the way to improvements. The most important appliance of all, the man who handles the brakes, is not ignored, and the suggestions made for the training and examination of drivers will go far to improve tramway services in many ways if generally put into practice. The general conclusions or recommendations of the Committee will, we think, meet the approval of tramway men generally, and, armed with this report, the tramway engineer or manager will find it easier to lead his committee or board in the right way as to brakes equipment and maintenance and the training of men. If reports of this kind reach the general public at all, the effect of this one will be reassuring as to the intrinsic safety of tramway working, as it shows clearly enough that means for safe working under any workable conditions are available, and that their proper application, maintenance, and use are well within the range of the common sense and vigilance essential to the conduct of any important public service. It follows that any public so informed will be more reasonably critical of any accidents that may occur within its ken. A point of some importance, as affecting the useful range or population distributing power of tramways, is that some of the brakes investigated maintain their efficiency at quite high speeds, and hence promise an early increase in the maximum speeds permitted, which means an increase of useful range. Naturally this has less application to town lines, where the slowness and cussedness of other traffic are more dangerous than the speed of the tramcar, than to suburban and inter-urban lines. But it is just these latter lines that are the disappointment of the tramway industry, mainly because they have failed to materialise; and it may happen that indirectly the Brakes Report may assist in their development.

THE first Paper of the session to be read before the Manchester section of the Institution of Electrical Engineers was interesting in several ways, and was eminently suitable for discussion by such a meeting. Its purpose was to convey a message from one section of the electrical engineering fraternity to another, and to take advantage of the provision by the Institution of a common ground whereon both the designing engineer, representing the contractor, and the consulting engineer, who represents the purchaser of plant, can meet on equal terms. Dr. KLOSS brought forward certain points in connection with turbo-generator specifications, which he desired to emphasise, and which would, he claimed, if more attention were paid to them, result in benefit to both sides of the industry. He was not in any way attempting to teach consulting engineers their business, nor seeking to persuade them to smooth the troublous path of the contractor. He simply desired to place the experience of the designer at their disposal. He sought to bring out clearly the ways in which the essential differences of low and high speed alternators affect their performance and capabilities, and the discussion of his Paper should lead to a more widespread understanding of the conditions under which the best results are given. Mr. SALTER'S amusing parody of the Paper in the discussion, if it is to be taken seriously, shows as much as anything the need for a better sense of proportion in considering both the advantages and the limitations of this class of machinery.

WILLIAM EDWARD AYRTON

Sept. 14, 1847—Nov. 4, 1908

WE have deep regret in announcing the death, after an illness of about three weeks, commencing with an attack of influenza, of Professor W. E. Ayrton, F.R.S., at his residence, in Norfolk Square, at 2.30 on Sunday morning. By his death a well-known figure in electrical circles has been removed, and another of the links between the present-day progress of electrical engineering and the pioneering work which preceded it has been severed. Professor Ayrton's health had been declining for some time previously to his fatal illness, and during the last seven years he has suffered somewhat from his heart. He retained, however, a considerable measure of that intense energy of intellect which characterised his life-work, and he attended the college as recently as October 16th. Although the last time he took part in the discussions of the Institution of Electrical Engineers was on February 7th, 1907, on the occasion of a Paper by Mr. C. C. Paterson on light standards, his occasional contributions to the Press have shown the continued keenness of his interest in technical matters and new problems.

Digitized by Google

At the time of his death he had been for twenty-four years professor of electrical engineering at the Central Technical College of the City and Guilds of London Institute in Exhibition Road, South Kensington. Prior to this he held a professorship for a few years at the Finsbury College of the same Institute. Much of his work, in conjunction with Professor John Perry—and the two names will always be remembered together—was done during this period, but their collaboration had an earlier origin, dating practically from their meeting in 1875 in Japan, where Ayrton had already been for two years professor of physics and telegraphy at the Imperial College of Engineering, Tokio, and Perry joined as professor of engineering. This was not, however, his first visit to the East, for in 1868 he went out to Bengal, where he was assistant electrical superintendent of the telegraph department and later superintendent. Between these two visits to Asia he returned to England to take charge under Lord Kelvin and Professor Fleeming Jenkin of the manufacture of the Great Western cable in 1872. To complete this brief sketch of his career it should be mentioned that he was educated at University College School and University College. He was a native of London, and the son of a barrister.

To attempt to indicate all the directions in which the work of this versatile man has lain is impossible. His greatness lay alike in his powers as a teacher of imparting knowledge and awakening enthusiasm, in his skill and powers of perception as an experimental investigator, and in his originality as an inventor. His indefatigable energy in all these directions is shown as much by the prodigious list of Papers communicated to the Royal Society, the Institution of Electrical Engineers, and other bodies, bearing his name either alone or in conjunction with others, as by the almost equally extensive list of patents which protected his inventions. He and Professor Perry were pioneers of more than one branch of electrical engineering. Their instruments were familiar when electrical measurements were but emerging from chaos, and many an electrical problem has been propounded as new from time to time which they had thoroughly investigated. Prof. Ayrton's long but more recent connection with Mr. T. Mather has led to another group of measuring instruments of a different character, and the Ayrton-Mather galvanometers are now as well known as the famous Ayrton and Perry twisted strip ammeter of earlier years. Much of his early work was devoted to electric traction and its possibilities, as well as electric lighting. In conjunction with Prof. Fleeming Jenkin a system of telpherage was developed by him before electric traction in any form was general. As far back as 1882 Ayrton and Perry patented a surface-contact system of electric traction, and in the following year, as joint engineers to the Faure Accumulator Co., they carried out the electric lighting of the Grand Hotel in London.

Prof. Ayrton was elected a Fellow of the Royal Society in 1881, was President of Section A of the British Association in 1888, of the Physical Society of London in 1890, and of the Institution of Electrical Engineers in 1892. He took a prominent part in the meeting of the British Association at Johannesburg in 1905.

His widow, Mrs. Hertha Ayrton, whom he married in 1885, is also well known as an original investigator in electrical science, and has the distinction of being the only lady member of the Institution of Electrical Engineers. Our sympathies and those of a wide circle of devoted friends will go out to her in her bereavement, and also to his two daughters. The funeral will take place at Brompton Cemetery at 2.30 to-day, and it is announced that to-night's meeting of the Institution of Electrical Engineers will be adjourned after references to his death by Prof. J. Perry and the President.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 12TH.

Royal Society.

4.30 p.m. Meeting at Burlington House, Piccadilly, London. Among the Papers down for reading are the following:—(1) "The Charges on Ions in Gases, and the Effect of Water Vapour on the Motion of Negative Ions," by Prof. J. S. Townsend, F.R.S.; (2) "The Charges on Ions produced by Radium," by C. E. Haselfoot; (3) "The Occlusion of the Residual Gas and the Fluorescence of the Glass Walls of Crookes' Tubes," by A. A. Campbell Swinton.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster. The meeting will adjourn after the announcement of the death of Professor W. E. Ayrton.

Institution of Electrical Engineers: Dublin Local Section.

8 p.m. Opening meeting of the Session at the Royal College of Science, when Mr. S. F. Pilditch, the chairman, will deliver his Inaugural Address.

FRIDAY, NOVEMBER 13TH.

Physical Society.

5 p.m. Meeting at the Physics Laboratory, University College, Gower Street, London. Agenda:—(1) "The Photo-Electric Properties of Potassium-Sodium Alloys," by Prof. J. A. Fleming, F.R.S.; (2) "Note on the Recombination of Ions in Air," by P. Phillips; (3) "On the Influence of the Magnetic Field on the Photographic Patterns produced by the Electric Spark," by A. W. Porter; (4) "On the Rate of Growth of Viscosity in Congealing Solutions," by A. O. Rankine; (5) "On the Isomeres of Adsorption by Solid Surfaces from Solutions," by Prof. F. T. Trouton. (6) Mr. A. W. Porter will exhibit an experiment illustrating an anomalous effect of lagging thin wires.

SATURDAY, NOVEMBER 14TH.

Birmingham and District Electric Club.

7 p.m. Meeting at the Colonnade Hotel, New Street. Paper to be read, "Electric Power for Small Consumers," by V. E. Walters.

MONDAY, NOVEMBER 16TH.

Institution of Electrical Engineers: Newcastle Local Section.

8 p.m. Opening meeting of the session at the Armstrong College, when the Chairman, Mr. A. L. E. Drummond, will deliver his Inaugural Address.

TUESDAY, NOVEMBER 17TH.

Institution of Electrical Engineers: Glasgow Local Section.

7 p.m. Seventh Annual Dinner at "The Grosvenor," Gordon Street.

Institution of Electrical Engineers: Manchester Local Section.

7.45 p.m. Ordinary meeting at the University, when Prof. E. Rutherford, of the Manchester University, will deliver a lecture. This lecture takes the place of the Paper announced on the syllabus by Messrs. R. G. and J. G. Cunliffe on "Vagabond Currents."

Junior Institution of Engineers.

8 p.m. Meeting at the Royal United Service Institution, Whitehall, London, when Mr. James Swinburne will deliver his Presidential Address on "Available Energy."

WEDNESDAY, NOVEMBER 18TH.

Royal Meteorological Society.

7.30 p.m. Meeting at 25 Great George Street, Westminster, London. Among the Papers down for reading is the following:—"Investigation of the Electrical State of the Upper Atmosphere made at the Howard Estate Observatory, Glossop," by W. Makower, Margaret White, and E. Marsden.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. Opening meeting, when Mr. J. S. Highfield will deliver an address on "The Responsibility of the Engineer."

Royal Society of Arts.

8 p.m. First ordinary meeting of the session. Inaugural Address by the Vice-President and Chairman of Council, Sir William White, K.C.B., F.R.S.

THURSDAY, NOVEMBER 19TH.

Institution of Electrical Engineers.

8 p.m. Extra meeting at 25 Great George Street, Westminster. Col. R. E. Crompton, C.B., the retiring President, will distribute the premiums awarded for Papers read during the session 1907–8. Mr. W. M. Mordey will then deliver his Presidential Address, and afterwards hold a reception in the library.

AN IMPRESSION OF THE LATE PROFESSOR AYRTON

By an Early Finsbury Student

FOR nearly thirty years Professor Ayrton has taken a leading place in the training of electrical engineers, and there can be few men more widely known in the profession than he. The announcement of his death will affect a very large number with a sense of personal loss, for Ayrton was a man whom one remembers even after short acquaintance. The writer is one of those who attended the Finsbury classes when they were commenced in the basement of the City of London School in 1879, when Professor Ayrton commenced his work for the City and Guilds Institute, and has ever since had reason to thank his teacher, not only for what he taught, but for showing him the right way of looking at the problems of engineering—teaching him how to learn, in fact, the rarest and best of the teacher's gifts. Lucidity and sympathy marked his lectures and his laboratory talks—lucidity and accurate expression, interesting and consecutive diction. One waited for the next lecture as though it were a chapter of an exciting story. Sympathy in the true sense of the word, a "feeling with" the learner, in his difficulties, and therefore showing him the way through them. Not exactly a patient man in general temperament, Professor Ayrton was never impatient or hasty with a student who tried to learn. A fine mathematician, with the "eye for an equation" that enabled him to omit half or three-fourths of the algebraic steps from his blackboard work, so that one had perforce to copy it there and prove it at length at leisure. He would at first go back over the work and through the steps verbally for the slow ones, but with a sense of justice to the quicker-minded or better equipped, he later arranged a special class for those who could not get through the work unaided, and so saved time for the others. Although since those Finsbury days the writer has only met Ayrton casually, he has always ranked him as a greatly valued friend, one who impressed for good, whose influence is lasting and beneficial.

There must be many of the hundreds of students who passed under Ayrton's teaching who feel likewise, and who now deem themselves the poorer for his death. The good he did is not "interred with his bones," for he taught applied science not only efficiently as science, but in a way that gave it a lasting moral value.

May the sympathy of many feeling thus comfort those he has left behind. As was well said a few days ago of his great master, Lord Kelvin, we will not sorrow for his loss, but rejoice that he lived.

REVIEWS OF BOOKS

Natural Sources of Power. By R. S. Ball. 348 pp. 5½ ins. by 8½ ins. 104 illustrations. (London: Archibald Constable & Co.) 6s. net.

THIS excellent book would have attracted more readers, and have suffered nothing in accuracy, if it had been called "Water and Wind Power," or by some other title which would indicate that it deals with water-wheels, turbines, and windmills. The author has succeeded in producing a practical handbook, and has steered between the rocks of abstruse theoretical design and the shallows of a popular treatment of the subjects. He defends his title by contrasting the direct application of water and wind with the decomposition which coal, oil, and other fuels must undergo before heat is developed, and the second transformation of heat into mechanical energy in some kind of engine. This distinction does not seem to be a material one; it is not easy to think of any source of power which is not "natural."

Perhaps the only weak part of the book is the electrical section of the elementary introduction. But it is possible that the author has deliberately avoided the conventional and misleading language of the text-book and lecture-room. Dealing as he has to do in the hydraulic part of the book, with cubic feet of water per second, he suggests that there is a difficulty "with the proper understanding of the unit of current—the ampere. It is unfortunate that we do not generally express a measure of current in any other way than by a single word, which itself hides the important element of time." Surely that is an advantage. We need not, as the French, speak of the intensity of the current, nor as the German, the strength of the current; but we use the simple idea of current, and the simple name ampere, and the workman's slang contraction, the "amp." Many a student has worried over the question whether an ampere is a coulomb per second or whether a coulomb is an ampere second; and if both are true, which is the essential or fundamental idea? We electrical men may pity hydraulic engineers that they have no word to express cubic feet per second or gallons per minute; the name of Francis might be employed for one of these.

The account of methods of gauging water, calculating water power, and levelling surveys are practical, and the descriptions of water-wheels, turbines, and their governors are clear and well illustrated. The latter part of the book dealing with windmills gives a very useful account of a little-understood branch of mechanical engineering. Thirty years ago, when the pumping windmills of Holland and the English fens were being replaced by steam engines and centrifugal pumps, and when steam-roller mills were superseding the corn-grinding windmill, it seemed that that "engine," to use the word in its older sense, would soon disappear. But while this is true of the old type of windmill, with its house and slowly turning sails, another class of mill is being adopted, and the author tells us that they are so widely used in great agricultural countries like Australia and the western parts of America and the Argentine that the manufacturers have found difficulty in keeping pace with the demand, notwithstanding the fact that there are several firms that turn them out by the thousand, and who can always find a ready market for them.

While the use of advanced mathematics is carefully avoided, details of design and questions of cost of power are carefully worked out, and the book will be of value not only to the student, but to the professional engineer.

Electric Furnaces. By Wilhelm Borchers. Translated by Henry G. Solomon. 218 pp. 8½ in. by 5¼ in. 282 illustrations. (London: Longmans, Green & Co.) 7s. 6d.

THE name of Wilhelm Borchers is so well known to all those who are interested in electrochemistry and electrometallurgy, that by all these and many others whose knowledge is more general this translation of Mr. Solomon will be welcomed. The English edition which is a translation of the second German

Digitized by Google

edition has, so far as possible, been brought up to date by the inclusion of recent work which has been published since the German book was printed, and therefore is of even greater use than the original German work. The book starts with an introduction dealing with methods of heating, and commencing with the conversion of electrical energy into heat. The following chapters all begin historically, and describe the different classes of furnace employed, from their inception upwards. Davy, as is generally admitted, appears to have constructed the first electric furnace in his classical experiments on the decomposition of the alkalis and alkaline earths. Of course, his experiments with the primitive means at his disposal were carried out on a most limited scale, beside which our present-day furnaces appear of mighty proportions. In his first experiments he employed direct heating, but he very soon found that better results were obtained by fusing the electrolyte with the electric current as well as employing it for electrolysis, and it is interesting to note that this has been the experience of all those engaged in the construction of modern electrometallurgical plant.

The first furnaces described are those used in connection with the manufacture of aluminium; there is not very much new, perhaps it is not possible to give anything new, in reference to this furnace. The Cowles furnace is described, then that of Hèroult, which is followed by reference to Borchers' own aluminium furnace and that of Minet, which is recommended for production of very pure aluminium, but which, as the author points out, although it might possibly give you pure aluminium, will only produce it at a cost which would make it prohibitive.

The furnaces of Hall & Bradley are then described, and it is mentioned that the British Aluminium Company employ the Hèroult furnace at their works at Foyers in Scotland. Of course, owing to the secrecy which has for long been maintained by the aluminium companies, the details given as to the work of the furnaces, their dimensions, and so forth, are very meagre. An account of iron and steel furnaces then follows. There is, perhaps, here rather too much description of furnaces which have never existed beyond the draughtsman's board. You see, for example, Wilkstroem, "who proposes to pass pig-iron immediately after it leaves the blast from the cupola furnace through a narrow channel, closed at the top, and to refine it quickly by subjecting the narrow stream of metal as it flows through to the action of an air blast . . . at the same time heating it electrically." But as this furnace has never got beyond being proposed, we doubt whether it should have been put in the book. The next one referred to is that of Gin, which, the author says, has not yet come into practical use. We are rather inclined, however, to think that the author is mistaken in his assumption, as a model of this furnace was shown at the Franco-British Exhibition, and it was there stated that it has been used on a commercial scale.

In an appendix at the end of the book, added by the translator, further reference is made to steel furnaces. Resistance furnaces of the Acheson and other types are well described.

Chapter IV. is devoted to direct arc heating, in which the substance to be heated forms one or both poles of the arc; perhaps the simplest form of such a furnace is that of Borchers himself, in which a thick carbon rod is bored out to form the interior of the crucible; the carbon rod is then made one pole, the material to be smelted placed in it, and then another carbon rod connected with the other pole is let down into the first one. Chapter V. treats of combined resistance and direct arc heating, and then Chapter VI. with indirect arc heating, where the substance to be heated is placed in a space which obtains its heat by radiation; such a furnace, for example, is well illustrated by the original Moissan furnace.

The book is well got up and illustrated. In parts we should have liked to have had a little more theory, and the furnaces are not always described quite sufficiently fully for those who are not already acquainted with them. It is, however, an extremely useful and standard work, and Mr. Solomon is to be congratulated upon the manner in which he has translated it.

The Slide Rule. By Charles N. Pickworth. Eleventh edition. 122 pp 7¼ in. by 5 in. 29 illustrations. (London: Whittaker & Co.) 2s.

In introducing the principles of logarithms, which is done very clearly and at no unnecessary length, the author points out that although many who have no conscious understanding of logarithms make good use of the slide rule, the blind reliance upon rules imposes limitations which can only be removed by a fuller grasp of the fundamental principles which underlie the operation of the slide rule. The ways in which the ordinary arithmetical operations are carried out are set forth in clearly worded rules. With regard to the question of finding the position of the decimal point, the author takes up a very sensible attitude, holding that this is a matter upon which it is not desirable to dogmatise. The personal factor has to be reckoned with, and while most practised users experience no difficulty in estimating the magnitude of the result by inspection or rough calculation, others find rules of considerable assistance. Would that the average text-book showed such broad-mindedness. The collection of methods of obtaining various powers and roots on the ordinary rule, operations appearing to many more difficult than they really are on account of lack of familiarity, is very complete. It includes a convenient method of the author's for determining cube roots, which we believe appears in this edition for the first time. Numerous examples of a practical nature illustrate the methods, and at the same time indicate the immense range of adaptability, of the slide rule. The latter portion of the book describes a number of special forms of the slide rule, including those for involution and evolution on the "log-log" principle, first applied by Dr. P. M. Roget in 1815, and since revived and rediscovered by others. The whole book is practical in the best sense of the word, but we think that the degree of accuracy obtainable in slide-rule results might have been kept a little more prominently before the reader throughout the work, instead of being only briefly treated in the concluding paragraph.

Pocket Book of Useful Formulæ and Memoranda for Civil and Mechanical Engineers. By Sir Guilford L., H. B., and W. H. Molesworth. 900 pp. 5 ins. by 3 ins. (London: E. & F. N. Spon.) 5s.

There is no engineering work better known than the famous pocket-book originated by Sir Guilford Molesworth in 1862, the twenty-sixth edition of which is now in circulation. The form of the work is the same as before, it is still a true pocket-book, but its contents have been so completely revised from time to time that the last edition is as up-to-date as was the first. The rapid strides of electrical engineering have necessitated the entire rewriting of the electrical section, occupying the last hundred pages or so of the book, and this has been done by Mr. W. H. Molesworth in a way which fully maintains the high reputation of the rest of the work. Looking through the pages, we find a quantity of useful matter not always included in these publications. Full particulars of aluminium, as well as copper, conductors are included, and such things as correct definitions of load factor and diversity factor have not been lost sight of. The section on electrical testing is not, however, quite as up to date as some other portions. The testing set described is of an antiquated, although undoubtedly excellent, type, and no mention of instruments of the "Megger" type is included. Again, in dealing with primary batteries, a description of the Grove cell is not required for reference by the practical engineer. The information on street lighting is thoroughly up to date, and in a most useful form, and the same may be said of the brief traction section, which includes an interesting table of running costs of recently opened electric railways. The misspelling of the name Zossen in this section will doubtless be corrected in further editions. The aim of the true pocket book has been consistently kept in view, and the redundant elementary and historical matter which spoils so many works of this class has been successfully avoided.

THE RATING OF TURBO-ALTERNATORS

AT the outset of his Paper on turbo-alternators, read on Tuesday, November 3rd, before the Manchester Local Section of the Institution of Electrical Engineers, Dr. M. Kloss (of Messrs. Siemens Brothers Dynamo Works) remarked that when reading specifications of such machines, one often found conditions laid down which were simply copied from slow-speed alternators where they were quite within the limits of commercial or physical possibilities, whereas in the case of turbo-alternators they might be impossible of fulfilment owing either to mechanical reasons or to commercial considerations. The object of the Paper was to investigate some of these points, more especially as regards ventilation, voltage regulation, and the influence of the power factor on the size of the machine.

In leading up to the subject of ventilation, it was pointed out that under otherwise equal conditions the output of an electrical apparatus increases approximately in proportion to its volume or as the cube of its linear dimensions, whilst the radiating surface only increases as the square. Hence there must be a limit of size where the surface is no longer sufficient to radiate the heat produced in the apparatus. Numerical examples were given to show how very much sooner this limit was bound to be reached with turbo-alternators than large slow-speed machines, owing to their much smaller surface compared to their output, and that it was quite necessary for the designer to provide special means for dissipating the heat, which was generated in a relatively very small space. The consequence of this, he continued, is that makers must design the rotors so that, either by their own shape or by additional fans at their ends, they produce a strong draught through the machine. This seems to be now quite common practice, at all events with machines, say, up to about 3,000 kw.

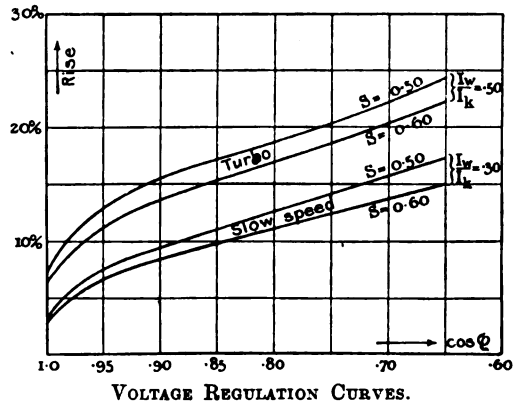
If, however, sets of larger capacity are to be installed the user has to face the fact that rather large quantities of heat will be produced in a comparatively small space, and it is quite a serious problem to consider beforehand what he is going to do with this energy. For instance, in a power station where it is intended to install six turbo sets of 6,000 kw. each, the amount of heat produced by these six sets running at the same time will be something like 1,500 kw., without allowing for the heat radiated by the steam turbines. If this great amount of energy were allowed to go into the engine-room without special provision for dispersing it, it would not be surprising to find the temperature in the engine-room rising rather rapidly to a point which would make it impossible for men to stay in the room.

The question thus resolves itself into the relative advantages of ventilating the engine-room or the machine itself, and a calculation for a hypothetical case showed that the amount of air required per minute was vastly less in the latter case. There were also the following advantages of the arrangement:—The machine is cooled with fresh, clean air, free from dirt and moisture, and therefore has a lower temperature rise than if the ventilating air was taken from inside the power-house. The machine is fully enclosed, and by this means the noise is reduced to a minimum. The appearance of the machine is greatly improved. The hot air issuing from the machine does not enter the engine-room, so that it is quite easy to keep this at a moderate temperature. The capital outlay for the necessary ventilating plant is smaller if the machines themselves are ventilated than if the engine-room is specially ventilated. In addition to this it is quite possible to utilise the energy contained in the hot air. It could be used either for heating buildings, or heating feed water for boilers, or by blowing it into the boiler fires, or for all kinds of other useful purposes, so that one may regain part of the energy which would otherwise be lost entirely.

As an example, the scheme adopted for the new 6,000-kw. turbo-alternators at Stuart Street, Manchester, was shown by an illustration which appeared in ELECTRICAL ENGINEERING, Vol. III., page 736.

The Paper then passed on to consider in what respects high-speed alternators differ from slow-speed alternators in regard to voltage regulation. In the first place, it was pointed out that in turbo machines with a small number of poles the amount of winding space per pole pitch was much more restricted than in large slow machines, so that it was difficult to find room for a sufficient number of ampere-turns to keep the armature reaction within reasonable limits. Indeed, Dr. Kloss went so far as to say that the output of such a machine was never limited by the stator, but always by the rotor, whether this be of the salient pole or of the cylindrical type.

In designing a machine which should be saleable as regards price, he continued, one is bound to go to the heat limit of the rotor. But even then it will not be possible to obtain the same number of ampere-bars per centimetre as in a multipolar machine. Consequently the armature strength must also be reduced, which means a reduction in the output per centimetre of circumference, with a corresponding increase in price per unit of output. Now, in order to prevent this increase in unit price from becoming prohibitive, we are driven to design the machine with a comparatively lower short-circuit current, because then we need not reduce the armature ampere-turns per centimetre in the same ratio as we are bound to do with the



VOLTAGE REGULATION CURVES.

field ampere-turns. This, of course, results in sacrificing something of the regulation of the machine, and it was this point which the author desired to make quite clear to those who had to draft specifications for turbo-alternators.

Some curves were then given to illustrate the point quantitatively. In this investigation the general case was taken of a machine with a short-circuit current, I and a normal current at a power factor cos ϕ of I_n. The factor $\frac{I_n}{I_k}$ was considered as giving the rating of the machine corresponding to its kilovolt-ampere output. In order to put this in a form more useful to station engineers, the watt component, $I_w = I_n \cos\phi$ was considered, and the kilowatt output of the generator expressed by the ratio $\frac{I_w}{I_k}$. Curves were given for various values of the saturation factor, with a view to showing that it was advisable to work at relatively high saturation, especially in the case of machines which are to be designed for a relatively low short-circuit current, that is to say, for a high ratio of $\frac{I_w}{I_k}$, whereas in machines with a high short-circuit current the saturation factor has not so great an influence on the regulation. However, as the high increase of exciting current at high saturation was not desirable, one was obliged to work at lower saturations than one would do if only the voltage regulation had to be looked out for. We must therefore make a compromise, and from his experience he found that for a modern machine the saturation factor should be between 0·50 and 0·60. The value of $\frac{I_w}{I_k}$ which can be worked to in a turbo machine, is not so low as that attainable in a slow-speed machine for reasons already pointed out. As fair average figures we can assume an $\frac{I_w}{I_k} = 0{\cdot}50$ for a turbo, and $\frac{I_w}{I_k} = 0{\cdot}30$ for a slow-speed machine. The two pairs of curves given in the figure can therefore be taken as representing relative conditions in the two classes of machines.

Summarising these results, it may be said that when specifying the voltage rise of a turbo-alternator due allowance should be made for the fact that the figures obtainable are not so low as those which can easily be obtained with multipolar machines. As fair figures for turbo-alternators can be regarded—5 to 7 per cent. for unity power factor; 13 to 15·5 per cent. for cos $\phi = 0{\cdot}90$; and 15 to 18 per cent. for cos $\phi = 0{\cdot}80$.

In the last portion of the Paper the influence of the rated power factor on the rating and price of a machine was dealt with, and it was shown by actual examples how much more expensive a machine has to be to be able to cope with a full-load current at a low power factor, and it was shown that when specifying the power factor at which a turbo-alternator has to

Digitized by Google

work, it is of no use to put in a lower figure than is actually prevailing in the station, as nothing can be gained by this, and it would, if anything, decrease the possible output of the machine.

DISCUSSION.

The discussion was opened by Mr. A. H. Law (Messrs. C. H. Parsons & Co.), who thought that the Paper should be very useful to the engineers to whom it was addressed. He was inclined to criticise the method of ventilation adopted in the 6,000 kw. Siemens turbo-alternator at Stuart Street, in which, apparently, the cold air went in from the outside, passing inward through ducts along the rotor, and then out again through the feet of the stator case. In view of Dr. Kloss's statement that the output of such a machine was limited, not by the stator but by the rotor, this seemed to him to be wrong, as the air passed through the rotor last, whereas this was the very part which required to be cooled as much as possible. Again, he thought that the author had not sufficiently realised the value of the V-shaped space between the poles for ventilating passages. In the machines at Carville this was fully taken advantage of. Forced ventilation was, he thought, being carried rather too far with small machines; it was absurd for machines under 500 kw. running at 3,000 r.p.m. His firm had long realised the limitations imposed by consideration of voltage regulation, and he passed on to recapitulate the leakage flux compounding arrangement adopted by them (see Electrical Engineering, Vol. III., page 546). This had been found very successful in cases of very variable loads, and enabled the machines to be designed for a much higher short-circuit current. The author's curves were no doubt correct as regards the voltage rise on throwing off the load, but he would like some further data regarding the voltage drop on putting on the load, a quantity which designers were rather shy of giving. He was fully in agreement with the author regarding the power factor question.

Mr. C. D. Seaton then made a characteristically witty speech, looking at the matter from a commercial point of view. The turbine builder was usually the main contractor, and many of the electrical troubles fell upon his shoulders also.

Mr. J. S. Peck (British Westinghouse Co.) personally favoured self-ventilation wherever this was practicable. At Lots Road, Chelsea, the 5,500 kw. alternators were all self-cooling, and although they discharged their hot air into the engine-room, the temperature was not unpleasant, even in summer. Dr. Kloss had shown that the amount of air required for cooling the machine was less than for ventilating the building, but this was discounted by the fact that it had to be forced against a much higher pressure. It was a debatable question whether close inherent regulation in large machines was really worth while. Indeed, on a heavy short circuit the poorer the regulation the less the resulting damage. In this respect, he said, Mr. Miles Walker's system of compounding an alternator is of great value, since it holds a constant voltage for ordinary load fluctuations, but in the event of a short-circuit where the power factor is very low, it gives poor regulation, and consequently a minimum amount of damage is done.

Mr. S. J. Watson (Chief Electrical Engineer, Bury Corporation) referred to the possibility of turning the heated air into the boiler furnaces, in order to improve their efficiency. He asked for some further details of losses of 6,000 kw. machines, especially as regards windage. The question of power factor was similar to regulation of D.C. machines. In order to obtain it it was obvious that some part of the machine had to be overworked or underworked at some time or another.

Mr. J. Frith (Messrs. Mather & Platt, Ltd.) thought that rather an artificial distinction had been made by some of the speakers between artificial cooling and self-ventilation. It had to be done with a fan in either case, whether this was mounted on the rotor shaft or on a shaft somewhere else. He then made the interesting suggestion of going further than this, and using a compressor in which the heat was extracted from the air, first in the water cooling of the compressor. The drop of temperature due to the expansion of the air in the turbine case would enable the machine to be worked at a lower temperature rise "above the surrounding air."

Mr. J. R. Salter (Chief Engineer Lancashire United Tramways Co.) regarded all these limitations and complications as arguments against the use of turbines at all, and thought that although the turbine had generally a lower price, if the extra losses due to the necessity for obtaining a higher vacuum and superheat, and for getting rid of the heat from the alternator were capitalised, there was very little to choose between a turbine and a reciprocating set. He was inclined to summarise Dr. Kloss's remarks as follows:—"You people, you have been used to slow-speed reciprocating alternators, they have had good ventilation, good regulation, and a good power factor. For goodness' sake do not come and ask me to give you those conditions, because I cannot do it."

Mr. Miles Walker (British Westinghouse Co.), wished to inform Mr. Salter that the efficiency of a turbo-generator was much higher than that of the ordinary reciprocating set, and one could obtain quite a good regulation. He did not agree with Dr. Kloss that the rotor temperature limited the output. It was quite possible to have a machine in which the highest temperature is reached in the armature, although the regulation was better than was that specified for the engine type of machine.

Dr. E. Rosenberg made some remarks regarding the effect of variations in the saturation factor. In a salient pole machine, high saturation is accompanied by high leakage; but with a cylindrical rotor, with a distributed winding, high saturation did not increase the leakage to any considerable extent. Therefore, for the same saturation factor, better regulation would be obtained with a cylindrical rotor than with the salient pole type. Dr. Kloss's statement "the inherent regulation of a turbo-alternator being naturally lower than the regulation of multi-polar machines," was quite right, as long as the same type of field is considered, but the particular demands of the turbo-alternator justified a departure from the type of slow-speed rotor, and it was possible to obtain, without undue cost, in a machine with only two or four poles, an even better regulation than in the multi-polar machine.

Dr. Kloss only replied briefly, reserving his full remarks for communication to the *Journal*.

THE DETERMINATION OF THE EFFICIENCY OF CONTINUOUS CURRENT MACHINES

A RECOGNISED and frequently used method for the determination of the efficiency of continuous-current machines is to run the machine light as a motor at full voltage, and to calculate the full-load efficiency from the no-load losses obtained in this way, by adding the value of the armature C^2R losses at full load as determined from the armature resistance. The Verband Deutscher Elektrotechniker includes this method in their rules as a sufficiently accurate test of efficiency, but no mention is made of the importance of taking the no-load losses with the commutator brushes in the neutral position.

In an article in a recent issue of the *Elektrotechnische Zeitschrift*, by W. Linke, some experiments carried out in the experimental laboratory of the Allgemeine Elektricitäts-Ges. are described, which show the variations in the efficiency which can be obtained when the above detail is not considered. The machine experimented with was a 10 h.p. motor, taking 19 amps. at 440 volts, and running at 1,150 r.p.m. Sparkless commutation at full load was obtained with a lag of 9 degrees, corresponding to about 1·6 segments; and when the motor was run light with the brushes in this position there was only a very slight sparking. The no-load current with the brushes in this position was 2·4 amp., corresponding to an input of about 1,100 watts, but when the brushes were placed in the neutral position, the input was only about 580 watts. There was thus a difference of over 500 watts, or about 6 per cent. of the total input to the motor. This difference is, of course, due to the heavy short-circuit currents in the armature, caused by the fact that the brushes were not in the neutral position in the first case. The coils short circuited by the brushes are in a strong field when the motor is running light, but at full load the armature reaction so shifts the neutral zone that the short-circuited coils are in the same relative position to the field, as they would be if the machine were running light with the brushes in the neutral position. To avoid these exaggerated armature losses, therefore, the no-load test must be made with the brushes in the neutral position. With an interpole motor, the neutral zone hardly changes from no-load to full-load, and so, in this case, the brush position is the same for no-load and full-load, and there are no short-circuit currents to be considered. The author describes a large number of experiments to demonstrate these facts, and gives oscillograph records of field flux density and armature current. The difference between the no-load losses as measured with the brushes in the full-load position and in the neutral position is largest with small machines, but even with large machines may amount to 20 or 30 per cent. of the no-load losses. To obtain the right efficiency, therefore, the brushes should be in the position in which the no-load losses are least, that is, the neutral position.

Electric Railways of the United Kingdom.—In the annual report of the Board of Trade, containing returns relating to the railway companies of the United Kingdom, it is stated that at the end of 1907 the length of electric railways (equivalent of single track) worked solely by electricity was 216¼ miles, and that 162 miles were being worked partly by electricity. The corresponding lengths of line at the end of 1906 were 197¼ and 157½ miles respectively. The total quantity of electrical energy used in 1907 was 213,675,447 units, as compared with 159,581,401 units in 1906. The total number of train miles run was 18,771,690, and the equivalent number of car miles 74,589,759. There are now 86 electric locomotives in use, 809 electric motor cars carrying passengers, and 1,275 trailer cars. These figures, it should be pointed out, include the Blackpool and Fleetwood tramroad and the Bessbrook and Newry tramway, which are classed as railways.

THE NEW WORKS OF THE ALUMINIUM CORPORATION IN NORTH WALES

High-fall Water Power Plant and 20,000-Volt Transmission Line

A NEW works for the manufacture of aluminium by means of electric furnaces is being established by the Aluminium Corporation, Limited, at Dolgarrog, six or seven miles from Conway, in North Wales. The Corporation have a factory of a similar character at Newcastle, which has been in operation for some time, but special interest attaches to this newly completed works in North Wales, since the principal source of energy is a water supply at a head of over a thousand feet, and a supplementary supply of electric power is obtained from a high-pressure overhead transmission line. Both sources of supply are unusual in this country. This additional supply of power is taken from the existing Cwm Dyli water-power generating station of the North Wales Power

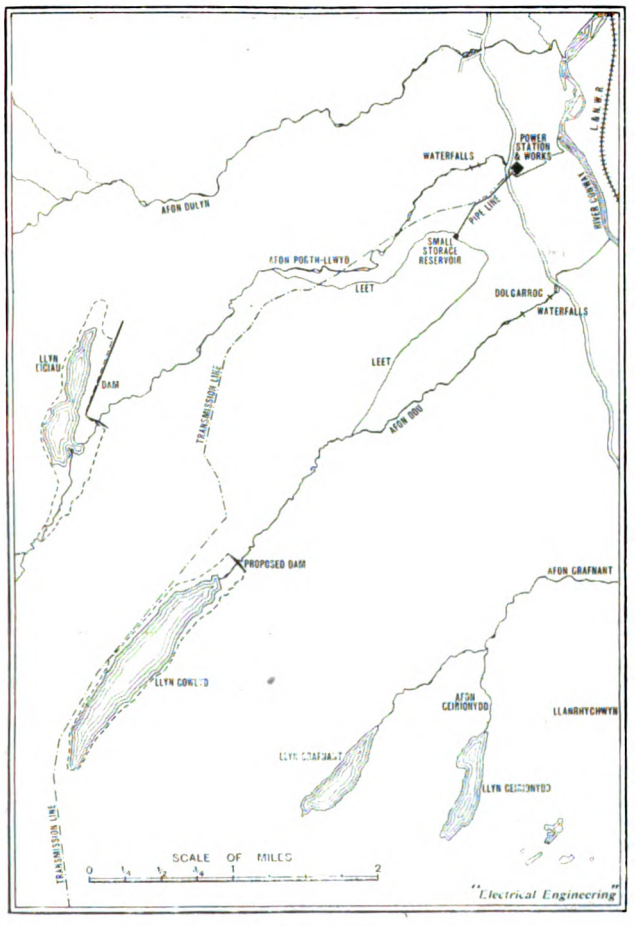

FIG. 1.—SKETCH MAP SHOWING POSITION OF WORKS.

and Traction Co., in the Nant Gwinant Valley, near Snowdon, through a 13-mile 20,000-volt transmission line. The power received over this line is converted to the low-pressure continuous current required for the aluminium furnaces by a pair of 600-kw. motor generator sets, which, together with the four main 1,000-kw. continuous-current machines driven by Pelton wheels, bring up the available power supply to the furnaces to 5,200 kw. In addition to this plant, another water-driven set of the same size is to be erected later on. The whole of the engineering work has been carried out under the supervision of Messrs. Harper Bros. & Co., of 13 St. Helen's Place, E.C., in conjunction with Messrs. Kincaid, Waller, Manville & Dawson, of 29 Great George Street, Westminster, who are joint consulting engineers to the scheme.

As shown in the sketch-map in Fig. 1, the site of the works is on the west side of the Conway river near the Porthllwyd waterfall and not far from the village of Talybont. The commercial facilities afforded by the position of the works are important. Steamers of 200 tons can discharge at Conway, and goods can be lightered from thence almost to the works door. A short bridge and embankment would give access to the L. & N.W. Rly. on the opposite side of the river. The works is furthermore immediately adjoining the main road, so that access is possible by road, rail, and river.

The watershed forms part of the Snowdonian Range, and is the highest land of considerable area in England and Wales. It comprises 14¼ sq. miles of land, situated at an elevation of 1,000 to 3,500 ft. The annual rainfall is from 60 to 170 inches, or an average of 100 inches per year. Two streams, Afon Porthllwyd and Afon Dhu, are tapped in the upper parts of their

FIG. 2.—VIEW SHOWING CONSTRUCTION OF LEET.

respective valleys at about 1,050 ft. level, and the water brought along by leets to a small service reservoir at the top of the hill overlooking the power station.

In order to provide a more continuous and reliable supply than is afforded by these two streams, although each of them is the overflow of a large mountain lake, the engineers have selected one of these lakes as a storage reservoir; Lake Eigiau, although at present smaller than Lake Cowlyd, has a larger rainfall basin, and, owing to the valley formation, can be made a much larger body of water than Cowlyd by damming the outlet. Accordingly a dam to raise the water level 20 ft. is in course of erection, and is, in fact, about three-fourths completed; this will provide an estimated storage of about 160 million cubic ft. of water, or about three times that of the lake at present. The intake works on the Porthllwyd stream have been completed; the whole length, one and a half miles, of the leet, part of which is shown in Fig. 2, to the service reservoir has been lined with concrete to make it watertight, and the service reservoir at the head of the pipe-line is complete with sluice-gates and screening apparatus. A telephone connects the power house with the service reservoir, and also with the Eigiau dam.

E

The water-power rights over Llyn Eigiau, which is 1,219 ft. above sea-level, were formerly the property of the North Wales Power Company, but were ceded to the Aluminium Corporation under agreements which also provided for the auxiliary supply of power already referred to over the transmission line which was constructed by the Aluminium Corporation. The rights over Llyn Cowlyd were obtained by arrangement with the Conway and Colwyn Bay Joint Water Board.

From the small service reservoir supplied in this way, a single 36-in. steel pipe-line descends the hillside, which for about one-third of its distance has a gradient of 1 in 1·3, straight down to the power station, giving an available head of 1,010 ft. with only 1,108 yards of pipe. This pipe-line can be seen in Fig. 3. The contractors for the hydraulic works and pipe-line were Messrs. Bott & Stennet, and the pipe work was supplied by Messrs. Stewart & Lloyds, of Glasgow.

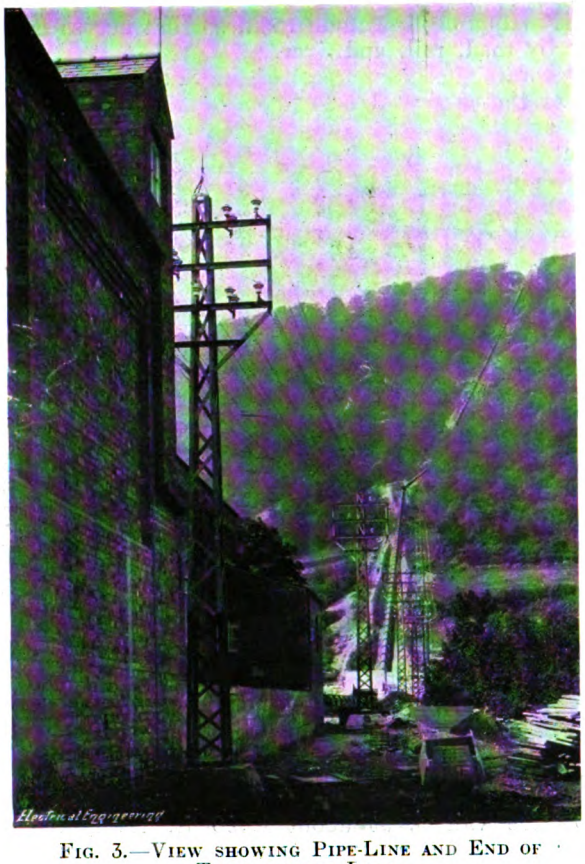

FIG. 3.—VIEW SHOWING PIPE-LINE AND END OF TRANSMISSION LINE.

The pipe is 36 in. diameter throughout. The upper portion is of the lock-bar type, varying from $\frac{1}{4}$ in. to $\frac{3}{8}$ in. in thickness, and jointed with lead and yarn. The main portion is of lap-welded steel, varying from $\frac{1}{2}$ in. to $\frac{7}{8}$ in. in thickness, with rubber joints. The appearance of these two styles of pipe is shown in Fig. 5. The whole pipe-line is divided into seven sections, each anchored at its lower end, and with an expansion joint at its upper end. The pipe continues through a 36-in. main sluice valve in a trench alongside the power-house, and the 12-in. branches to the main water wheels and the smaller connection for the lighting set are taken off at right angles opposite each set.

A general view of the works is shown in Fig. 4. The machine-room contains a row of four double horizontal shaft Pelton wheels manufactured by Messrs. Ganz & Co., of Buda-Pesth, each coupled directly to two 500-kw. continuous-current generators manufactured by Messrs. Bruce Peebles & Co. In addition to these are the two motor generators already mentioned for dealing with the power from the high-tension line. A further 1,000-kw. Pelton set is to be installed later on as a spare.

The Pelton wheels are of practically the same design as those in the main power-house of the North Wales Power Co. except for minor improvements, such as in

FIG. 4.—GENERAL VIEW OF WORKS.

the construction of the filters, &c. Each machine contains two separate bucket-wheels, each with the usual twin buckets, and the supply can be regulated by hand by needle valves which alter the volume of the jets. The automatic governing is, however, done by deflecting the nozzles so that a greater or less amount of water passes clear of the buckets direct down the tail race. The arrangements of the nozzles on trunnions for this

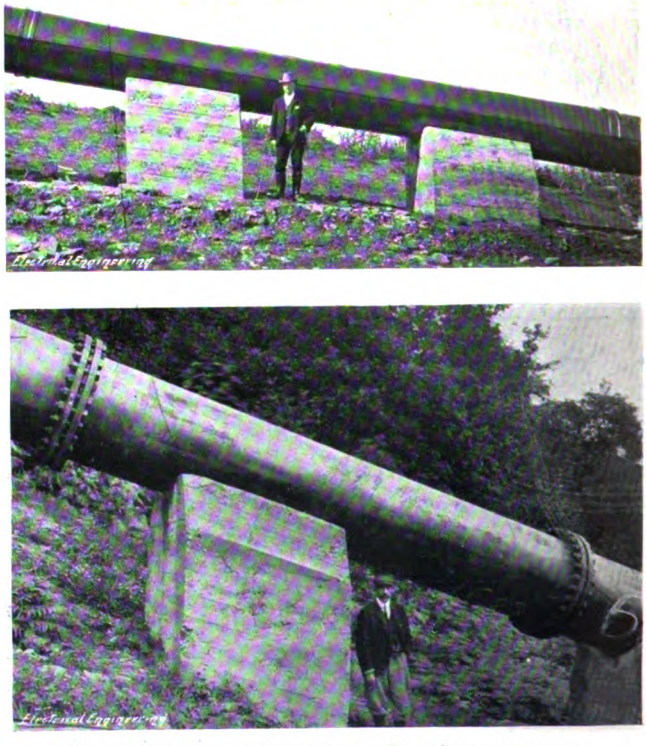

FIG. 5.—VIEWS OF SECTIONS OF PIPE-LINE, SHOWING LOCK-BAR AND LAP WELDED PIPES.

purpose and other mechanical details can be seen from Fig. 6. The governor is of the centrifugal type, and actuates the deflecting nozzles through the medium of a hydraulic relay cylinder. The machines have water-cooled bearings, and run at 450 r.p.m., with a water pressure at the valve of about 430 lb. per

Digitized by Google

sq. in. The speed of each set is indicated by a belt-driven "gyrometer" of Messrs. W. H. Bailey's manufacture, mounted on a pillar by each set. Coupled direct to each water-wheel through rigid couplings and a 10-in. shaft are two 500-kw. continuous-current 16-pole shunt-wound generators coupled in tandem. The two machines of each set are connected permanently in parallel, and the total output per set is 8,000 amperes at voltages varying up to 125 volts. The appearance of one of these sets is shown in Fig. 7. The guaranteed efficiencies of the generators are as follows:—full load, 93 per cent.; three-quarter load, 92 per cent.; and half load, 90·5 per cent.

The lighting of the works is obtained, as will be seen hereafter, partly from a small independent water-driven set also supplied by Messrs. Bruce Peebles & Co. This consists of a horizontal shaft Pelton wheel manufactured by Messrs. Carrick and Ritchie, of Edinburgh, driving a Bruce Peebles continuous-current dynamo with an output of 30 kw. at 105 volts. The Pelton wheel is designed to give out 50 B.H.P. when running at a speed of 900 r.p.m. under a head of

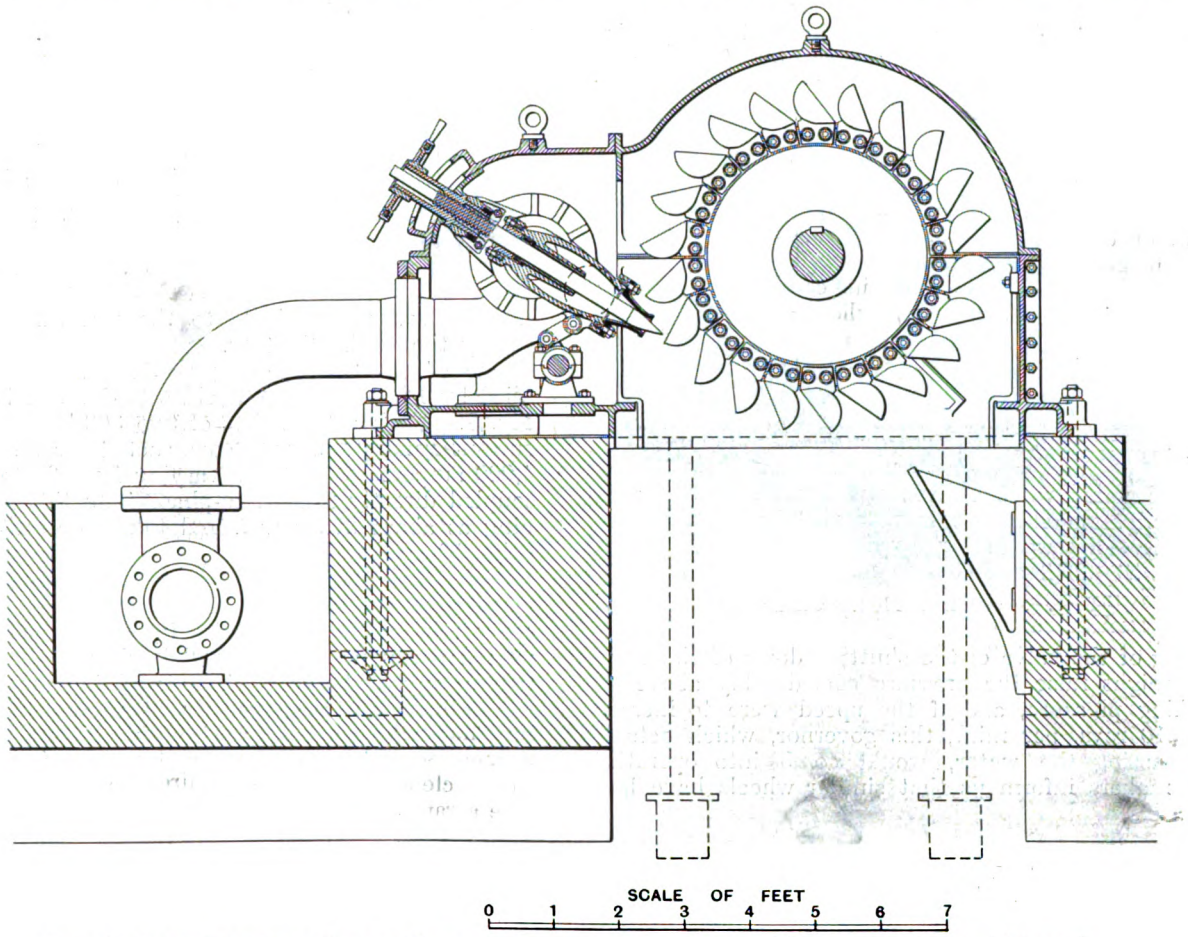

FIG. 6.—CROSS SECTION OF PELTON WHEEL, SHOWING ARRANGEMENT OF NOZZLES AND BUCKET WHEELS.

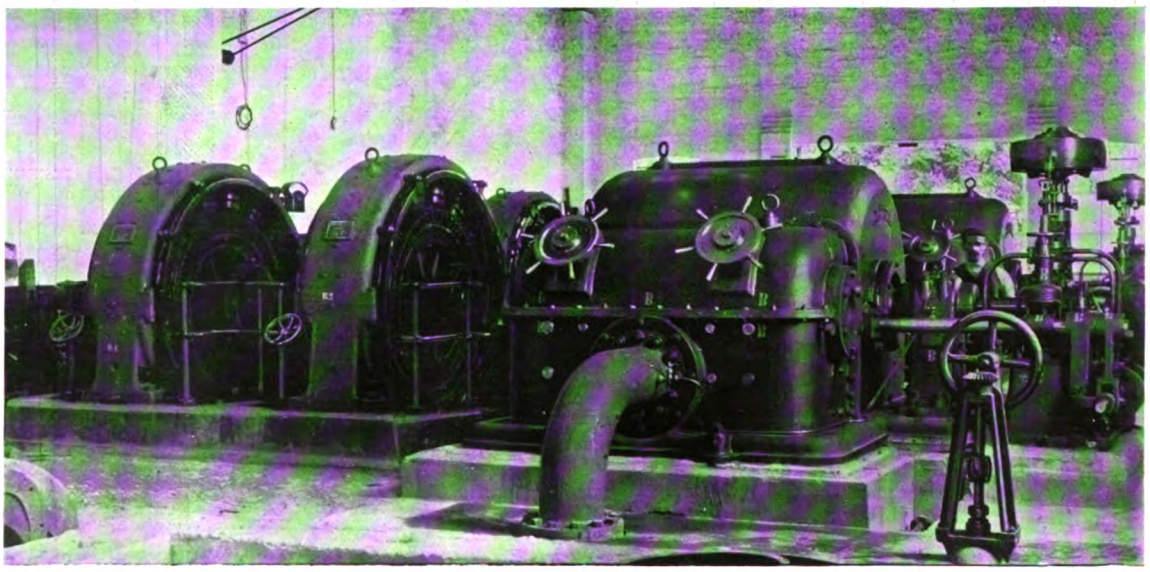

FIG. 7.—1,000 KW. PELTON WHEEL SETS.

Digitized by Google

1,000 ft., and is constructed entirely of steel. The method of governing employed is of some interest. In addition to a hydraulic Pickering governor throttling the supply, another governor has been fitted to relieve the pressure, if through any circumstance it rises above the ordinary working pressure. The sudden

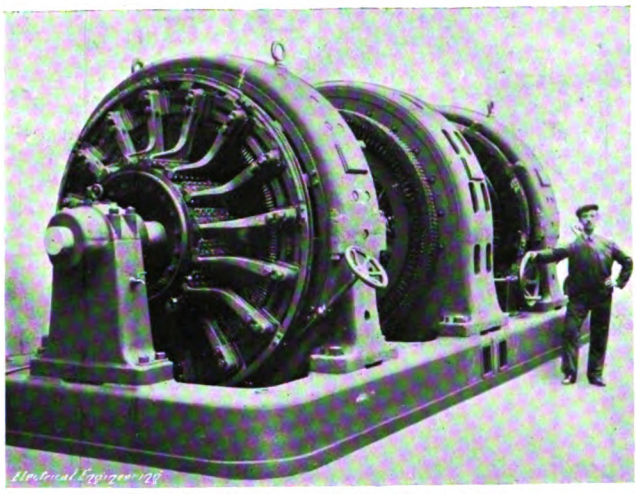

FIG. 8.—600 KW. MOTOR GENERATOR.

closing of the valve or the shutting down of the entire load might raise the pressure considerably above the working pressure, and if the speed were to increase only 10 revs. per min., this governor, which acts by bye-passing the water, would come into operation. The makers inform us that similar wheels have been tested elsewhere, where one per cent. increase of speed immediately brought the governors into action.

Before describing the switchgear used in connection with the machines already described, we may draw attention to the converting plant which deals with the 20,000-volt supply from the North Wales Power and Traction Co. This supply, which reaches the station at a full-load voltage of about 19,250 volts at 50 cycles, allowing for the drop in the line, is first of all stepped down to 1,050 volts in a pair of three-phase "Berry" oil-immersed water-cooled transformers, each of which has a capacity of 1,000 k.v.a., and is intended to supply one of the motor-generator sets already alluded to. The efficiency of these transformers on full load is as high as $98\frac{3}{4}$ per cent., and the voltage regulation on any power factor is guaranteed to be within 1·4 per cent. It may be mentioned that arrangements are made whereby these two transformers can be run in parallel, although it is intended usually to run them each on its own separate motor-generator circuit. There is also an auxiliary 30-kw. Berry transformer stepping down to 105 volts, which can be used alternatively to the water-driven set to supply the works lighting.

One of the two motor-generators which were supplied by Messrs. Bruce Peebles & Co. can be seen in Fig. 8. Each set consists of two 300-kw. continuous-current generators, each constructed for an output of 4,000 amperes at voltages varying from 25 to 75 volts, coupled directly to a three-phase induction motor running at about 375 r.p.m. and taking current at 1,050 volts 50 cycles from the transformers already mentioned. The three machines are mounted on one bedplate with the motor in the centre. The generators are of the 16-pole type with interpoles, and are connected permanently in parallel without the intervention of any switchgear. The induction motors are of the ordinary slip ring type with star-connected stators, provided with rotor short-circuiting device worked by a hand wheel at the side, and are started up by means of liquid starters placed alongside the sets.

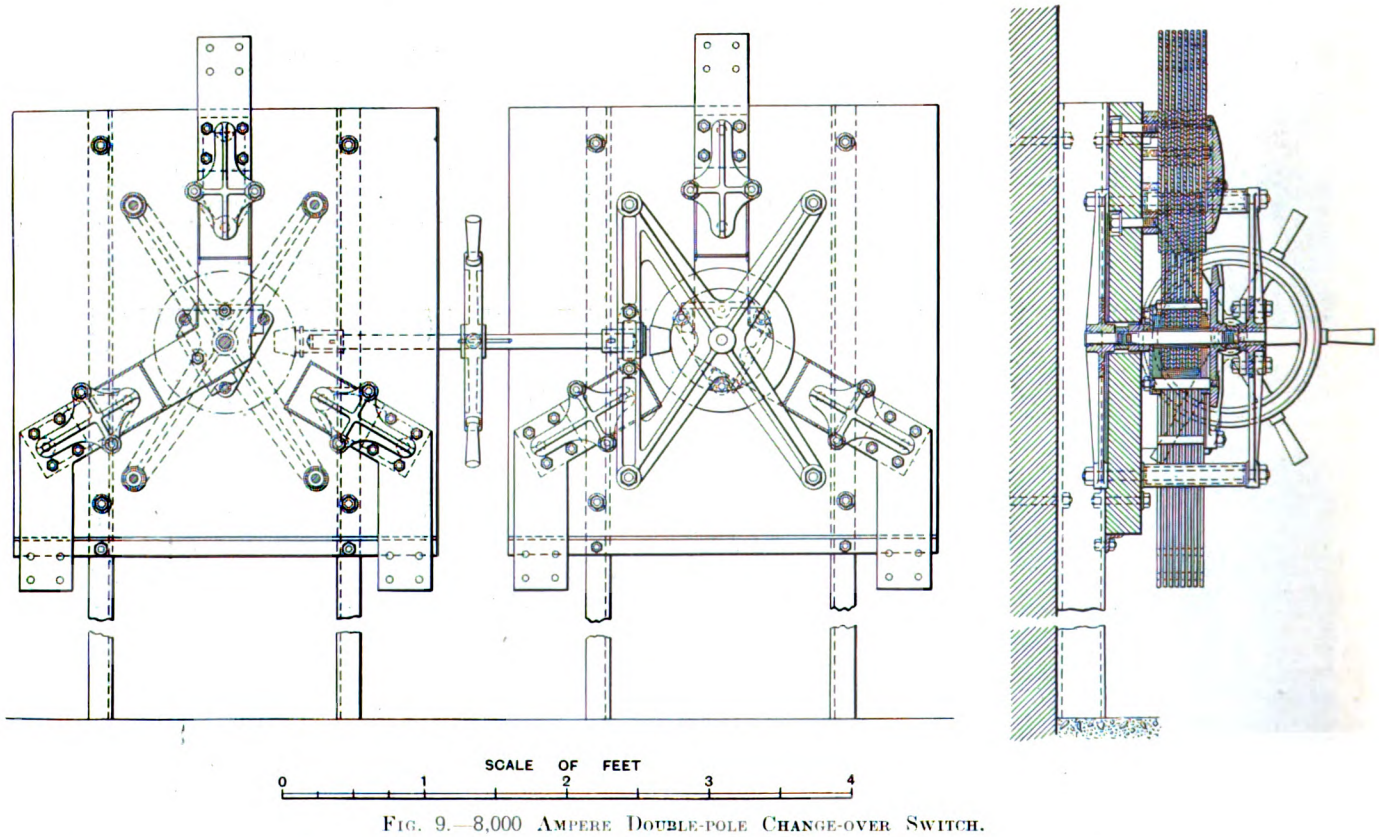

FIG. 9.—8,000 AMPERE DOUBLE-POLE CHANGE-OVER SWITCH.

The furnace room, the exterior of which can be seen in Fig. 4, adjoins the machine room. It is lofty and well lighted, and is some 200 ft. long by 160 ft. wide. Along the wall immediately adjacent to the generating sets runs a pair of copper 'bus-bars 8 sq. in. in section. These bars are only intended to be used occasionally as "hospital-bars," or for coupling together any de-

Digitized by Google

sired machine or furnace circuit. Ordinarily, each line of furnaces will be fed from its own machine through the massive connections coming direct through the wall. These main connections are each of 16 sq. in. section aluminium, built up of eight bars each 4 in. by ½ in. From each of these, a set of eight 1 sq. in. flexible copper cables lead to the furnaces. These are arranged in groups of 25 connected in series, and taking a working current of about 7,500 amperes, but the groups can, of course, be sub-divided if required. Five such groups will eventually be installed, and of these three are already erected. Thus, when working at full power, each water-driven machine will run one group of 25 furnaces with a pressure of from 120 to 130 volts, each pull of each machine, and each pair is operated through gearing by a hand-wheel, and is so arranged that in its different positions, either the machine, or the furnace circuit, can be connected to the 'bus-bars in the furnace-room or to each other, independently of the 'bus-bars. There are no fuses, circuit-breakers, or other protective devices in the circuits. The only other switchgear relating to the continuous-current side of the plant is the marble control panels with instruments and shunt rheostats, placed alongside each generator set and motor generator. These were supplied by Messrs. Ferranti, Ltd.

On the other side of the machine-room is a three-panel marble board also by Messrs. Ferranti, Ltd. This is composed of three panels, two of which belong to the 1,000-volt motor-generator circuits and the remainder is the works lighting distribution panel, provided with necessary switches for taking the supply for this from either the auxiliary water-driven generator or the small transformer already mentioned, fed from the incoming transmission line. The induction motor panels do not call for special remark; the main switches are of Messrs. Ferranti's standard oil break pattern mounted immediately behind the board, and operated by levers projecting through slots in the panels; they

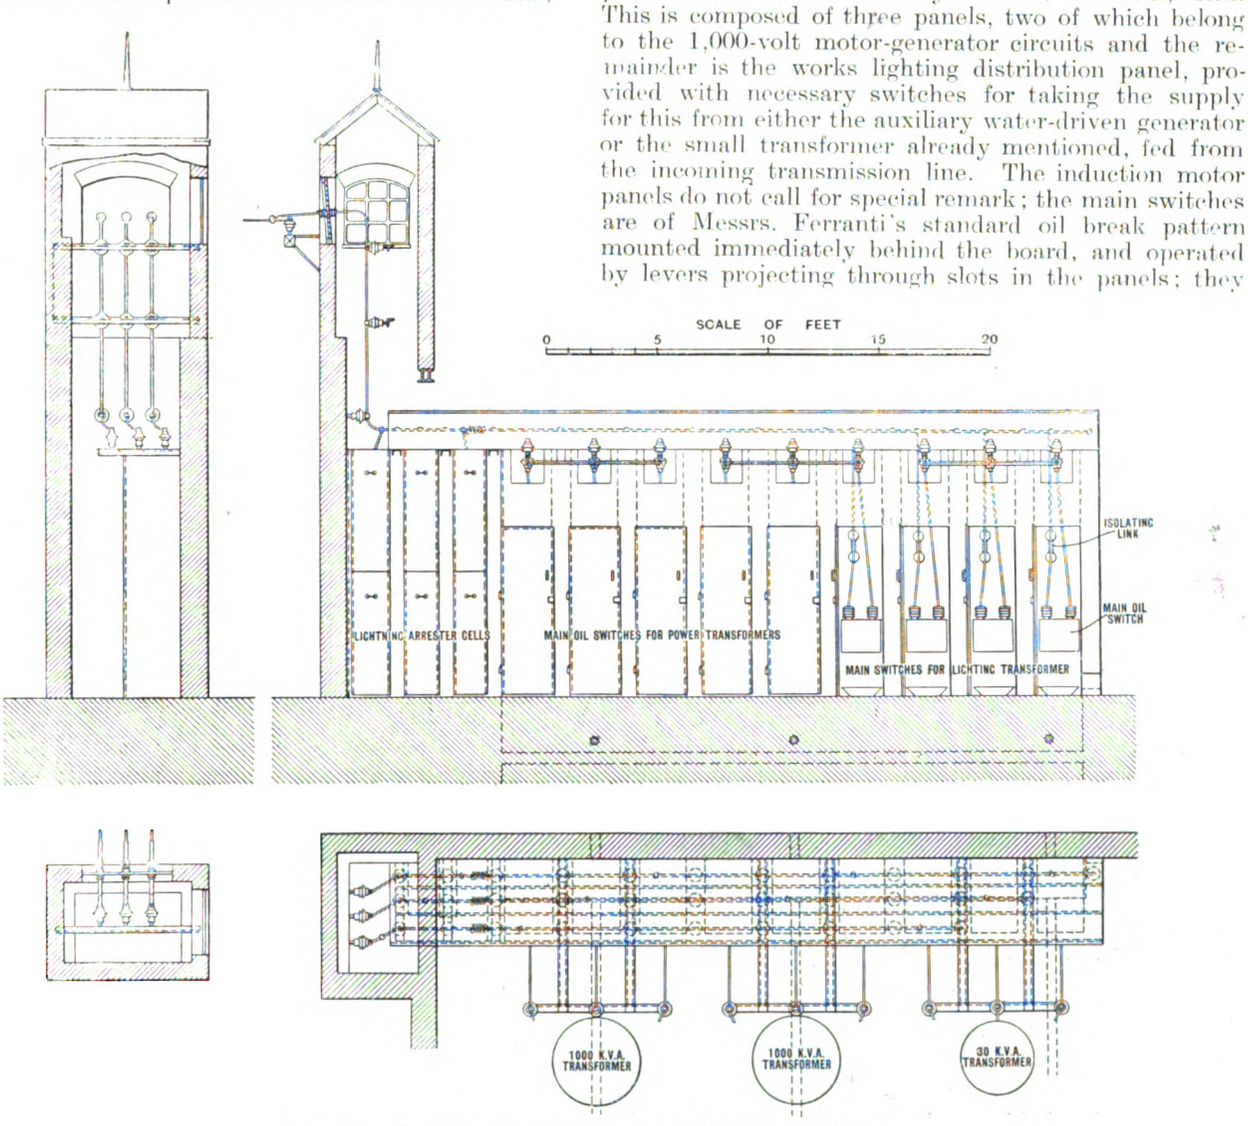

FIG. 10. GENERAL ARRANGEMENT OF E.T.H. SWITCHGEAR.

across the terminals of the group, while the remaining group of 18 furnaces only will be run off one of the motor generators, which, as already seen, work only up to 75 volts. In practice, however, various other combinations can be made. The total capacity of the works will be five tons of aluminium per day. The behaviour of each furnace can be studied by means of the conspicuous low reading voltmeter with which each is provided, and which indicates the voltage drop across the terminals of the furnace.

The switchgear between the generators and the furnace room connections is simple and substantial, but at the same time ingenious, and consists of special 8,000 ampere "capstan" switches supplied by the British Thomson-Houston Co. The construction of these is shown in Fig. 9. One of these switches is placed on are provided with release coils worked in connection with three-pole overload time-limit relays. All the high tension connections are contained in a large expanded metal cage in the switch-room, immediately behind the board. In the same room are placed the transformers already mentioned, and the brickwork cells closed by iron doors containing the 20,000-volt switchgear. The main 20,000-volt oil switches in the primary circuits of the large transformers are entirely without release gear, and are operated through rodding by large levers and quadrants in the main machine-room.

The general arrangement of the 20,000-volt switchgear is shown in Fig. 10. The three wires of the transmission line enter the top of the switchroom through three large porcelain insulators lined with mica

Digitized by Google

tubes and set in the centre of marble panels. These tubes and panels are inclined so as to drain outwards in the usual way. Each phase is provided with a lightning arrester equipment, and these are contained in the first three of the row of brick cells at the end where the line enters. The lighning arresters are of a type developed by Messrs. Ferranti, Ltd., who supplied the whole of the E.H.T. gear. The main gap

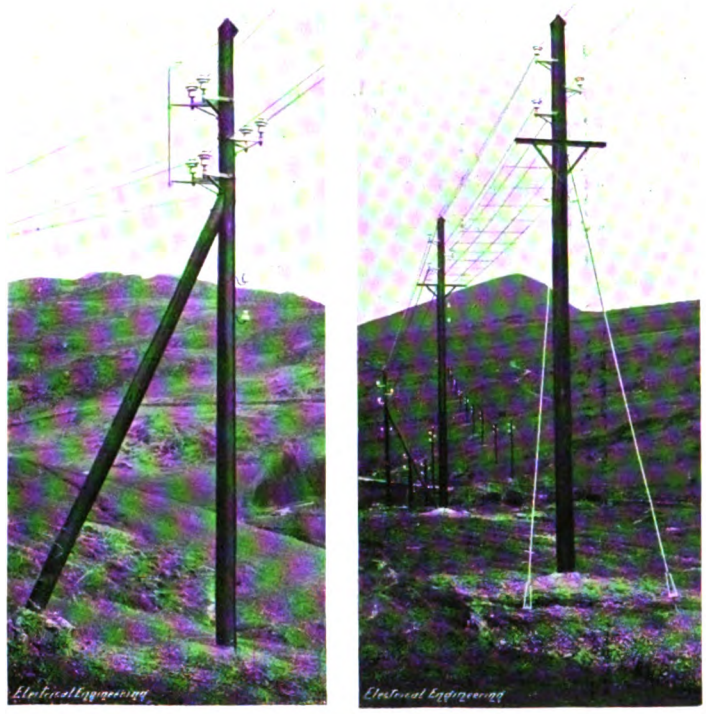

FIG. 11.—VIEWS OF TRANSMISSION LINE, SHOWING DIFFERENT ARRANGEMENTS OF POLES.

consists in each case of a pair of brass balls $\frac{1}{4}$ in. apart, without any horn or other blow-out arrangement. In series with these, on the earth side, are a set of ordinary multi-cylinder arresters with 45 gaps in series, and finally between these and earth is a water resistance formed by a rubber hose with metal connections, through which water obtained from the main-pipe-line through a reducing valve is always circulating. A similar lightning arrester equipment is installed at the power-house end of the line, but there are no intermediate arresters of any kind along the 13 miles of line. The E.H.T. 'bus-bars, which can simply be looked upon as extensions of the line, as they are unprovided with incoming feeder switches, run through choking coils between slate partitions across the top of the cells and are supported on similar insulators to those used for the line. The remaining nine cells contain the main 20,000-volt oil switches for the two 1,000-kw. power transformers and the small lighting transformer respectively. Each phase is in a separate cell, which contains nothing else but the oil switch and suitable isolating links. There are no current or pressure transformers, nor release coils or relays, as there are no instruments on the E.H.T. side, and, as already mentioned, only the secondary oil switches are fitted with tripping attachments. The whole arrangement is thus of particularly simple and reliable character. For the sake of easy distinction, apparatus belonging to the respective phases is here and there painted red, white, and blue.

The end of the transmission line is shown in Fig. 1, and the lower portion where it comes down the hill alongside of the pipe-line can be seen in Fig. 3. With the exception of the four lattice steel poles shown in Fig. 3 the line is entirely supported on wooden poles. The photographs reproduced in Fig. 11 and the drawings in Fig. 12 show the arrangement, not only of the standard pole on straight portions of the line where it runs across open country, but also the special arrangements adopted for corner poles, road crossings, &c. The line was also erected by Messrs. Bott & Stennett. As a general rule, the poles, which are set in concerete, are 120 ft. apart, and they vary in height from 36 ft. to 38 ft., but the minimum height of the lowest of the three wires above the ground is 26 ft. A telephone line runs the whole length of the line at a height of about 22 ft. above ground, and elaborate precautions are taken to avoid risk from this becoming alive. The wiring was done by Messrs. Saunders & Co., of London.

The line wires are of copper 6 mm. diameter, supported on triple petticoat porcelain insulators supplied by the Karlsbader Kaolin-Industrie-Gesellschaft, of Merkelsgrün, near Karlsbad (Austria). These insulators are 8 in. over all height and 7 in. extreme width, and have all been tested up to 90,000 volts. They are mounted on iron pins, to which they are affixed by a cement of glycerine and litharge. The pins are supported by galvanised iron brackets of the simple form shown in the illustrations. These brackets are all connected to the overhead earth wire strung above the line wires from the tops of the poles. The line is divided into ten sections for testing purposes, and was designed for a voltage drop on full load of 1 per cent. per mile. Each pole is to be provided with an inverted crown of

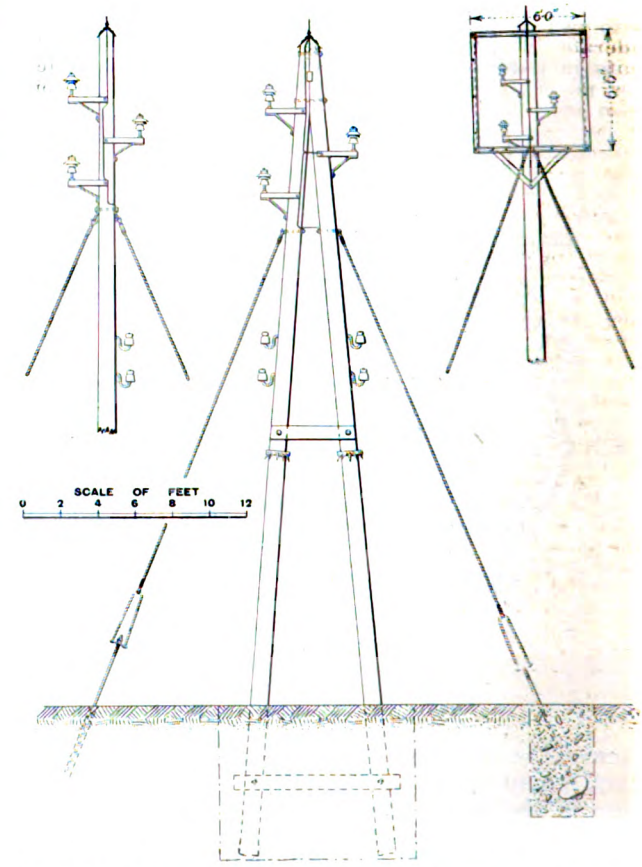

FIG. 12.—ARRANGEMENT OF STANDARD AND SPECIAL POLES.

spikes to prevent the inquisitive climbing up the poles, and a warning notice is provided, reading:—Rhybudd: Dalier sylw mae yn beryglus i gyffwrdd a'r gwifrau, with the English equivalent—Take notice, it is dangerous to touch the wires.

The only additions to the plant at the Cwm Dyli power-house to deal with the transmission line have been the 10,000/20,000-volt step-up transformers,

Digitized by Google

which are of the Westinghouse auto-transformer type, and the necessary switchgear and lightning arrestors on similar lines to that at the Dolgarrog end of the line.

In conclusion, we wish to express our thanks to Messrs. Harper Brothers, consulting engineers to the scheme, for putting at our disposal the drawings and photographs from which the illustrations in this article have been prepared, and who, partly through their representative at the works, Mr. L. D. Taylor, and Mr. E. H. Rainbow, gave us technical particulars of the work. We also wish to acknowledge the kind assistance of Mr. E. F. Jones, Works Manager to the Aluminium Corporation, Mr. Hutchinson, the Station Superintendent, and Mr. R. Waite, of Messrs. Bruce Peebles & Co., on the occasion of the visit of our representative to the works.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

IN *Electrochemical and Metallurgical Industry* for November there is a description of the Roechling Rodenhauser three-phase induction furnace, and it is pointed out that this type of furnace originated in the simple induction furnace, which led to the combined induction and electrode type for single-phase currents, and finally to the three-phase type. Both electrical and metallurgical considerations have been the cause of this development. Electrically, the power factor has been the prime consideration. The original induction furnace was essentially a transformer with a secondary of fused metal, and the high temperature of this secondary required very careful heat insulation from the primary winding, and also from the magnetic iron core. For these reasons the whole of the magnetic flux does not link with both primary and secondary, and consequently there is considerable magnetic leakage. There is self-induction in both circuits in place of mutual induction, and consequently there is a low power factor. The improvement of the power factor has been one of the chief aims of designers of induction furnaces. It can be accomplished by reducing the frequency of the alternating current, but if this reduction is carried out to an extreme it is necessary to have large and expensive generators made for large furnaces. The solution of the difficulty was ultimately obtained by relinquishing simple induction, and adopting combined electrode and induction furnaces. The pole plates in the Roechling Rodenhauser furnace are to all intents and purposes electrodes; they are really a new class of electrode, as they contain no carbon, and do not require regulating mechanism, but they have rendered possible the building of combination furnaces which will work at ordinary commercial frequencies with a satisfactory power factor. Other causes which led to the evolution of this furnace were of a mechanical nature, as, for example, the very narrow channel for the fused secondary in the earlier form of induction furnace, which caused difficulty in charging, cleaning, repairing, &c. The large hearth of the new furnace also solves a metallurgical difficulty. When steel has to be refined by means of very hot slag it is difficult to get the slag at a sufficiently high temperature in a pure induction furnace owing to the induced currents preferring to pass through the metal bath, which is the path of least resistance. In the Roechling Rodenhauser furnace the current from the pole plates is forced through the slag, and further, the rotary magnetic field causes an automatic circulation of the bath.

A recent American Consular Report contains the following information relating to the successful results obtained in a large German steel works by the substitution of two 250 h.p. electric furnaces for the original plant of thirty-two crucible furnaces. Each of the two furnaces is capable of holding a charge of one ton of metal, and only one is used at a time. Power is supplied to the works at 5,200 volts three-phase from a large generating station near Cologne, and transformed down to 110 volts at the works. These furnaces have been used continuously since the beginning of this year, and the main product has been cast steel, containing about 0·06 per cent. phosphorus, 0·03 per cent. sulphur, and from 0·08 to 0·18 per cent. carbon. Occasionally charges of tool steel have been cast, containing from 0·7 to 1·3 per cent. of carbon, with and without the addition of nickel, chromium, or tungsten. The material employed is ordinarily slugs, cuttings, turnings, and other waste of wrought iron, costing about £3 10s. per ton. A fusion, including the refining, lasts about five hours and involves a consumption of about 900 kilowatt hours for one ton of cast steel. The entire charge of one ton is poured at once. When the furnace is kept in continual use the magnesite lining lasts for about seventy operations, *i.e.*, twenty to twenty-five days. A stoppage of five days is required for each renewal, but during this period the reserve furnace is employed. The cost of current to the works is only about 0·54d. per unit, so that the total cost of current for a single operation amounts to about 40s. Including capital charges, and all working costs, as renewal of lining, labour, electrodes, and also cost of raw materials, the total cost of cast steel produced by this method is about £8 per ton. It is stated that cheaper raw materials can be used in the new furnaces, and that, owing to the high temperature at which the metal leaves the furnace, much better castings are obtained. The furnaces are constructed on the Stassano system, in which carbon electrodes enter by openings in the side of the furnace, the arc being struck just above the furnace of the metal. The furnace is rotated about an axis slightly inclined to the vertical by a 5 h.p. motor, to bring about a thorough mixing. The electrodes are water-cooled. A fusion takes 3½ hours, with a further period of 1½ hours to remove the phosphorous and sulphur. The report concludes with the statement that the crucible processes will soon be entirely superseded by the new electric furnaces.

Tramway Rail Imports and Exports.—In answer to a question in the House of Commons last week, the President of the Board of Trade stated that 1,362 tons of tramway rails of a declared value of £8,766 were imported into this country from Belgium in 1907, and 2,509 of a declared value of £18,046 from other countries. In the same year 4,077 tons of tramway rails of British manufacture, valued at £69,284, were exported from the United Kingdom.

Disturbances on Australian Telegraph Lines.—In a report submitted to the Australian Postmaster-General by the engineer for New South Wales, mention is made of a serious disturbance which took place last September, causing considerable delay on the Sidney-Melbourne lines. The foreign current was so strong that quadruplex work had to be temporarily abandoned. Duplex working was carried on, however, by making the line current coincide with the foreign current. After a few hours the foreign current fell from its maximum value of 20 milliamperes to 9 milliamperes, and quadruplex working was resumed. The chief engineer, Mr. Hesketh, reports that it was the most severe disturbance he had ever met with in Australia.

Students' Section I.E.E.—As usual, the Students' Section of the Institution of Electrical Engineers during the next session will meet in the Library of the Institution, 92 Victoria Street, Westminster, S.W. The following are the Papers down for reading:—November 18th, Opening Address by Mr. J. S. Highfield on "The Responsibility of the Engineer"; December 2nd, "Electric Road Vehicles" (other than tramcars), by Stanley H. Hills; December 16th, "Auto-Transformers and Metallic Filament Lamps," by George H. Stevens; January 20th, "Modern Mining Switchgear," by John F. Shipley; February 3rd, "The Direct-current Variable-speed Motor and its Application to Modern Machine Tools," by W. Stanley Lonsdale; February 17th, "Purification of Boiler Feed Water," by Thomas Walmsley; March 3rd, "Rheostats," by J. S. Messent; March 17th, "Central Station E.H.T. Switchgear and Control," by Edward F. Hetherington; March 31st, "Electricity Supply," by W. Bernard Thompson; April 21st, "Sewage Pumping Electrically of a Small Town," by Joseph S. Lazarus; May 5th, "Some Notes on Relays," by Ernest W. Moss. No programme of visits has yet been arranged, but the committee will be pleased to consider any suggestion put before them. The hon. secretary is Mr. G. H. Stevens, 266 Barry Road, Dulwich Park, London, S.E.

The Acton Electricity Undertaking.—In our issue for August 27th, 1908, page 311, we gave some particulars of the Acton electricity undertaking, and of the heavy loss which has been incurred, in spite of the fact that this undertaking has merely the simple task to perform of buying its electricity in bulk, converting it to low pressure, and retailing it to the consumer. Electrical energy is purchased from the Metropolitan Electric Supply Co., Ltd., at an average price of under 2d. per unit, the average selling price being 3·88d. per unit. This margin, however, has not been nearly sufficient to meet the sub-station, distribution and management costs, and the capital charges. The capital cost of the undertaking, including money spent upon consumers' installations, has worked out at £191 per kw. Owing to the unsatisfactory condition of affairs Sir Alexander Kennedy was called in to advise, and has now presented his report. In this report the obvious fact is pointed out that all the charges relating to the undertaking are too high and can only be appreciably reduced by an increase in the demand, which, however, is regarded as improbable, owing to the impossibility of being able to reduce the price. Sir Alexander Kennedy then referred to a new offer made by the Metropolitan Co., under which the total amount of about £4,000 per annum should not be decreased, but that a larger amount of energy should be supplied for this sum until a load of 500 kw. is reached. The advisers to the Council, however, estimate that this proposal is equivalent to £7 7s. 4d. per kw. of maximum demand per annum, plus one-third per unit, and there does not seem any disposition to accept the proposal. This price is being contrasted with the prices scheduled in the London Power Bills.

THE DENNY MAGAZINE FUSE

ONE of the novelties at the Manchester Exhibition was a new form of "magazine" fuse, which was shown both by Messrs. Bullers, Ltd., of Tipton, Staffs., and also by Messrs. Berry, Skinner & Co., who are the selling agents. It is manufactured by Bullers, Ltd., under Denny's patent. The illustrations below show the fuse in its case, and also the porcelain interior, which takes five fuse wires. This is rotated by a

Complete. With case removed.

DENNY MAGAZINE FUSE.

milled head at the bottom of the case, and the fuse, together with a number, is visible through the window in the front of a case. There is a ratchet arranged so that the fuse-holder can only be revolved in one direction, and this makes it impossible to turn back on to a way in which the fuse has already blown. There is a sixth position of the fuse-drum, in which the word "Off" appears at the window, and it is only when the drum is in this position that the interior can be removed for replacing the fuse.

PORTABLE METER TESTING RESISTANCES

THE practice of testing meters on the premises of the user in preference to taking them to the station for testing is becoming more and more common. With a view to facilitating the testing *in situ* which necessitates the provision of a steady load of sufficient magnitude for enabling the test to be done with rapidity, Messrs. Wm. Geipel & Co., of Vulcan Works, St. Thomas Street, S.E., are introducing a series of portable rheostats especially arranged for this purpose. The rheostats consist of a number of resistance units of the well-known Ward Leonard pattern, each one being of suitable capacity for connecting directly across the line pressure. These units are enclosed in a compact, perforated metal case. The load is adjusted to suit the test by switching in one or more of the resistance units by means of the knife switches provided for the purpose; 20 different loads can thus be made by equal increments, each switch being marked with the corresponding number of amperes. They can be supplied in various sizes from 10 to 50 amperes, for use on all pressures between 100 and 250 volts. The rheostat is light, small, and of convenient shape for portability. For example, a 20-ampere, 100-volt rheostat weighs 13 lb. and measures 5 in. by 12 in. by 9 in. The case is furnished with eyelets which can be attached to straps for carrying.

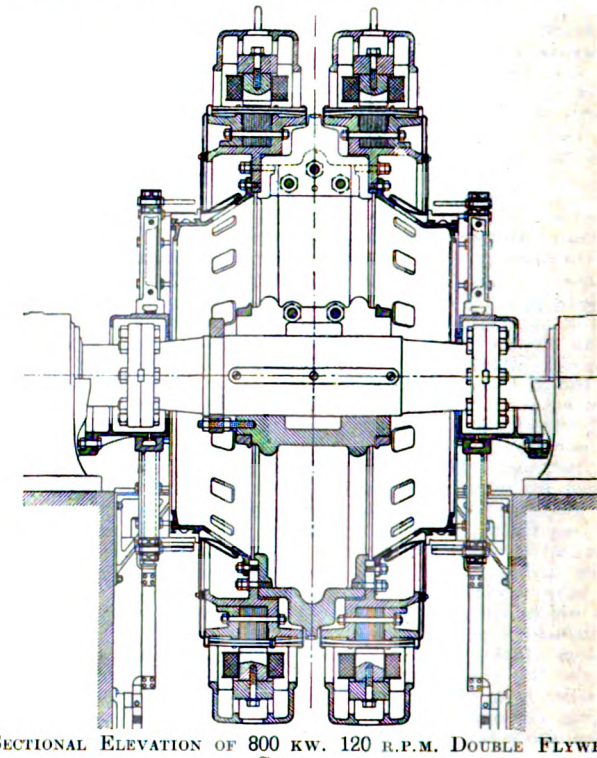
The Olympia Motor Show.—The seventh exhibition organised by the Society of Motor Manufacturers and Traders will be opened at Olympia to-morrow, and will remain open till Saturday, November 21st, inclusive. The Exhibition, as was the case last winter, will be confined to passenger vehicles intended for private use, with tyres and accessories. The exhibition of commercial vehicles will be held as usual in the spring. It is announced that over 300 firms will be taking part.

Railway Electrification in Chicago.—A decision has definitely been arrived at by a general meeting of the shareholders of the Illinois Central Railroad to convert the service within the limits of the City of Chicago to electric traction. There has been for some time an agitation in favour of this, mainly on account of the smoke nuisance from the existing steam locomotives. The change will involve 26 main lines entering the city, and six terminal stations, besides lesser lines.

A LARGE SLOW-SPEED DOUBLE FLYWHEEL GENERATOR

SOME details of an interesting double flywheel generator are given in a description of the electrical plant at the Rombacher smelting works, in Germany, which appeared in a recent issue of *Elektrische Kraftbetriebe und Bahnen*. The generating plant at these works includes a large number of alternating-current and continuous-current generators, and of these latter, four are of the flywheel type, and are coupled to slow-speed gas engines running on blast-furnace gas. Two of these generators are constructed as single flywheel machines, and the other two as double flywheel machines. The construction of the latter can be seen from the section drawing reproduced below. Each generator consists of two armatures mounted on a common spider by means of a double row of arms, and two separate field systems. The complete machine is mounted in the middle of the shaft of a four-cylinder gas engine, with two cylinders working in tandem on either side of the generator. The gas engines were supplied by the Vereinigte Machinenfabriken Augsburg, of Nürnberg.

The gas engine is rated at 1,200 h.p., and has a speed of 120 r.p.m.; each half of the generator is rated at 400 kw. The machines generate at from 230 to 350 volts per armature.



SECTIONAL ELEVATION OF 800 KW. 120 R.P.M. DOUBLE FLYWHEEL GENERATOR.

Each armature is provided with a series-parallel winding for five circuits and twenty poles; and equipotential connections, the position of which on the commutator sleeve can be seen in the illustration above, are also provided. This drawing also shows the manner in which the unusually long commutator lugs are supported by means of an insulating ring fixed to a projection of the armature frame. Wrought iron poles of oval shape are bolted on to the cast iron yoke, which is bell-shaped to give great rigidity. The brush-rockers are supported, as shown, on castings surrounding the couplings, and fixed to the main bearings. The following are a few further particulars of the machine:- Armature diameter, 3,500 mm.; length, 180 mm.; number of poles, 20; number of slots, 675; conductors per slot, 2; number of commutator segments, 675; outer diameter of frame, 4,500 mm. The weight of the stationary parts amounts to nearly 27 tons, and the weight of the rotating part 37 tons. The single flywheel generators have also an output of 800 kw. each, and are coupled to gas engines running at 110 r.p.m. These generators have a rather larger armature diameter, but weigh less than the double flywheel machines.

The Association of Teachers in Technical Institutions.—At the fourth annual meeting of this Association, held on Saturday last, Mr. J. Wilson, of the Battersea Polytechnic, was elected President, and the annual report was adopted. A meeting of the London Branch was held afterwards, at which Mr. W. J. Lineham read a Paper on "Technical Education at the Franco-British Exhibition."

REPORT OF THE COMMITTEE ON TRAMWAY BRAKES

Appointed by the Tramway and Light Railways Association

IN his report to the Board of Trade on the accident which occurred on the Highgate Archway tramway on June 23rd, 1906, Col. Yorke suggested that it would be desirable for the Tramways Associations to consider carefully the whole question of braking apparatus and sanding arrangements for tramcars. The Council of the Tramways and Light Railways Association, recognising that it was necessary for the Association to reassure the public as to the precautions taken to ensure their safety, at once appointed a Special Committee to inquire into and report on the whole question of brakes.

This Committee, which has now issued a report occupying over 200 pages of the official circular of the Tramways and Light Railways Association, consisted of the following members:—

Mr. Stephen Sellon, Consulting Engineer (Chairman); Mr. A. L. C. Fell, Chief Officer, London County Council Tramways; Mr. W. Worby Beaumont, Consulting Engineer; Major P. Cardew (Messrs. Preece & Cardew), Consulting Engineer; Mr. A. N. Connett, Director and Chief Engineer, Messrs. J. G. White & Co., Ltd.; Mr. R. J. Howley, Inspecting Officer, British Electrical Federation, Ltd., Mr. A. H. Pott, Chief Engineer, Metropolitan Electric Tramways, Ltd., and Mr. H. M. Sayers, Consulting Engineer.

The report commences with a masterly recapitulation and discussion of the general objects to be arrived at to obtain braking effects, and the usual methods adopted, and classifies the conditions under which tramcar braking has to be carried out as follows:—

(1) Service stops, for the setting down and picking up of passengers, and the observance of Board of Trade and Traffic Regulations prescribing stops at certain places. (2) The regulation and control of speed on falling gradients, or "coasting." (3) Stops to avoid accidents, from collision with other vehicles, pedestrians, or obstacles. (4) Runaway stops, to bring under control a car which has attained a dangerous speed on a falling gradient, and is likely to suffer collision, derailment, or overturn unless stopped before reaching a given point.

The results of a number of tests for determining the coefficient of friction of brake-blocks under service conditions. So far as they go these tests indicate that steel shoes maintain a higher coefficient of friction on bad rails than has been supposed. Tests with both wood and steel through a higher range of specific pressures corresponding to service loads, and with rails "greased" with the mud of different localities, are needed to complete our knowledge of the subject.

A large amount of information was obtained from tramway undertakings, and full particulars were obtained relating to 5,018 cars, 3,625 of which are mounted on single trucks and 1,393 on double trucks. The following are the types of brake fitted to these cars:—

Hand wheel brake	5,018	cars
Rheostatic brake	2,866	,,
Magnetic track brake	1,278	,,
Mechanical track brake	1,967	,,
Electric short-circuit brake	917	,,
Pneumatic track brake	121	,,
Regenerative control	60	,,

Eighty-seven cars are reported to have the controller so arranged that when it is in the "off" position an electric short-circuit brake comes into operation automatically when the car runs back. The particulars collected show that for ordinary service stops the hand-wheel brake is generally used, except on systems working heavy bogie cars in congested traffic, where the magnetic track brake has been largely adopted as a service brake. In some cases the magnetic track brake, while fitted, is reserved for emergency work; the reason it is not used for service stops appears to be the limited capacity of the motors. The rheostatic brake is also used to some extent for making service stops. All systems, with but few exceptions, report the use of an electric form of brake—short-circuit, rheostatic, or magnetic track—for making emergency stops. Where the pneumatic track brake is fitted, it is used, often in combination with the hand or electric brake, for making emergency stops. The rheostatic brake is very largely fitted, especially by the smaller undertakings working in semi-urban and rural districts. The reason of its popularity appears to be that it is inexpensive. The hand brake is generally used for coasting on a gradient flatter than 1 in 20, except in some cases where the magnetic track brake is fitted and is used for this purpose. On gradients steeper than 1 in 20 some form of track brake is usually fitted. When coasting on the mechanical track brake the rule appears to be to apply it before commencing the descent, the speed regulation being controlled by the hand-brake.

The Committee examined and tested a large number of forms of brake, and their opinions and conclusions are given below:—

Wheel Brakes.—The limiting retarding force possible is the product of adhesion and weight. When the applied force exceeds this, skidding results, and in consequence diminished retardation. For general tramway purposes it is inadvisable to calculate on a higher coefficient than 0·25, or a higher retardation than 8 ft. per second. Should the rail be greasy the adhesion value may be considerably less, and the retardation correspondingly reduced. If it is a hand brake, the retardation must be comparatively slow. The time of application, physical effort, and other operations, which he must simultaneously perform, make it unreasonable to demand of a motorman efficient stops. However, with a power wheel brake which requires no effort to apply and to moderate in power after initial application, good results should be expected.

The effect of the condition of the rail on the possible braking effort can be reduced to within small limits by the use of sand. A careful examination of tests leads us to believe that the hand brake should give a retardation from 3 feet per second for a heavy double-deck car to 5·50 feet for a single-truck lighter car.

Slipper Brakes.—The limiting retardation possible is the product of the whole weight of the car carried on the slipper shoes, and the coefficient of friction between brake shoes and rail. With wooden shoes giving 0·5 coemcient on a dry rail, this would be 16 feet per second. With metal shoes and 0·20 coefficient, the retardation would be 6·4 feet per second. How near these results are realisable in practice depends upon the safe proportion of the weight of the car which may be carried on the shoes and the time to apply the maximum effort.

Mr. Pott made an interesting experiment with a single-deck radial truck car weighing about 10 tons, equipped with the old design of Spencer brake, and found that by applying the maximum efforts of a man, 50 per cent. of the weight of the car could be raised. In ordinary practice it is probable that this would not be more than 40 per cent. with this individual brake. Experience shows that at least 40 per cent. of the weight of car may be safely taken on the slipper blocks. With Estler Brothers' pneumatic slipper brake the car equipped with two-cylinder brake equipment weighs 7 tons and that with four-cylinder equipment 9½ tons. At 50 lbs. pressure this would mean 33 per cent. total weight in one case, and 43 per cent. in the other. It is evident, however, that this type of brake could be designed to take any predetermined percentage of the car weight.

It is important to note that the proportion of weight carried by slipper brake shoes diminishes the efficiency of the wheel, or any brake acting through the wheel, and therefore dependent upon wheel adhesion to the same extent; however, as the coefficient of friction with wood slipper shoes is greater, the effectiveness of the car weight for braking purposes is proportionately increased. The hand slipper brake is slow in application, and requires considerable effort, two serious disadvantages. With power application, both of these disappear. The Pringle type of slipper brake can only be an emergency brake, and the same may be said of the Freund brake in the form seen by the Committee, but it is understood that a later form is designed to extend its scope to service and coasting use.

Rheostatic Brake.—This brake is dependent upon wheel adhesion. Its extreme limit of effectiveness is therefore the same as the wheel brake. But it is independent of the varying coefficient of friction of wheel brake shoes. If it could be set at a maximum constant value for any condition of rail, it would give a maximum stop up to rail adhesion with a uniform retardation. But as the speed decreases, the power of the brake diminishes, unless the resistance of the brake circuit is correspondingly diminished. It is not practicable, therefore, to consider anything like maximum results for this brake; however, the tests generally show that it is an effective brake for quick stopping. The use of sand to maintain adhesion at its higher values is a necessary adjunct to the brake. A retardation of 4·0 ft. per second can be expected. It is open to the objection of bringing additional work on the motors.

Magnetic Track Brake.—The retardation with this brake

Digitized by Google

comes from several features which differ considerably in the different types of the brakes. All have one feature, viz. the friction of the magnetic shoes with the rail. With the Westinghouse brake, the shoes are allowed to "drag" on the rail, and communicate a retarding force through the wheel brake shoes in so doing. In the "Maley Brake" this "drag" is communicated to metal track brake shoes. The British Thomson-Houston Co.'s brake is not fitted with either of the above features.

All types of this brake having motor excitation have a corresponding rheostatic brake action working through the wheels to produce retardation. A hand mechanical attachment to the magnetic shoes can be fitted to any of these brakes. Broadly speaking, the latest pattern of magnetic shoe in general use on bogie cars has a maximum force of application to the rail of 4,000 lb., while that of a shoe as fitted to a single truck car is 2,800 lb. The coefficient of friction of the shoes is not easy to determine. Mr. Fell, who has made such a variety of tests on these brakes, and who has also carried out experiments to determine the coefficient of magnetic shoes on a steel rail, has assumed this at 0·22, which is the value indicated by his tests. Assuming, however, a value of 0·20, we have a retardation force of 3,200 lb. in the case of a bogie car, and 2,240 lb. in the case of a single truck car. These forces are independent of the weight of the car. Taking the weights of the cars as 14·5 tons and 10·5 tons respectively, we get retardations due to the magnets alone of 3·18 ft. per second and 3·06 ft. per second respectively. The rheostatic brake and the wheel brake action combined, or the former alone, as the case may be, should not exceed 50 per cent. of the maximum adhesion of the car wheels, as in other electric brakes acting through the wheels; for the danger of skidding must be avoided, as the whole brake then ceases to act when motor excitation is used, which is almost universally the case. The retardation, then, through the wheels becomes 4·0 ft. per second, or a total retardation of 7·18 ft. per second in the first case, and 7·06 ft. per second in the second case. As the exciting current available for these shoes is largely in excess of that required for saturation throughout the greater portion of the braking operation, it is safe to take the average value of the magnetic force at 90 per cent. of the maximum value. Assuming this figure, the retardations due to magnet shoes alone drop to 2·86 ft. per second and 2·75 ft. per second, and the total retardations to 6·86 ft. per second and 6·75 ft. per second for bogie and single truck cars respectively. The magnetic brake with or without wheel block attachment may be fitted with a solenoid device for controlling the motor field current, and thus eliminating all danger of skidding the car wheels. The advantage that the Maley brake may have over the ordinary form of Westinghouse brake is that the danger of skidding the wheels is reduced. That these brakes are efficient in stopping a car is certain. That they add to the work of the motors is also certain, and, further, they have the disadvantage that faults occurring in an electrical brake are not so obvious as those of a mechanical brake.

The report then passes on to consider the most frequent causes of accidents, which are discussed briefly under the following headings:—Insufficient training of motormen; physical unfitness; the human element; multiplicity of motormen's duties; defective mechanism, and insufficient inspection.

A long section follows entitled "Various Types of Brakes," and describes in more detail all the best-known types of tramway brakes, tabulating their advantages and disadvantages as they appear to the Committee. Regarding the general suitability of different brakes to varying conditions, the following remarks are made:—

The wheel and rheostatic brakes are the simplest and cheapest. They may be relied upon for retardations up to 3 ft. per second with average rail conditions and moderate speeds. For cars not exceeding 10 tons in weight, manual application is suitable for wheel brakes. The rheostatic brake has the advantage of utilising the whole available wheel adhesion independently of speed within the limit of "flashing." The two brakes named are fair alternatives for each other. The retardation stated is suitable for service stops, but is not sufficient for working on heavy gradients or making emergency stops from high speed. On clean rails or with the assistance of sand, greater retardation can be reckoned on, but to make full use of it, especially with heavy cars and high speeds, the time of application of wheel brakes must be minimised by the use of power. The "runback" use of the rheostatic, or rather short circuit, brake is a valuable device where moderate or severe gradients are worked over.

Regenerative control considered as a braking device is equivalent to the rheostatic brake with the addition of definite speed control between certain limits.

The slipper brake with wooden blocks is especially suitable for controlling speed on severe gradients. With manual application it is not sufficiently rapid in action, and is also too exacting on the driver to be used as a service or emergency brake. With power application it becomes a good emergency brake, and only the rapid wear of the wooden blocks is against its use for service purposes. With iron blocks there is little or no advantage in utilising the weight of the car on slippers instead of on the wheels.

The skid brake is a pure emergency appliance, and must be considered as a special addition to the normal braking equipment to meet special risks.

The magnetic track brake applied to the rail-head only has the advantage of rapid and easy application, but it does not afford a great addition to the braking power which is obtainable from wheel brakes under given conditions of rail. It is, in effect, a rheostatic brake of increased power, and may take its place under moderate conditions of service when quicker stopping power seems desirable.

The magnetic track brake with auxiliary blocks applied to the wheels is an extremely powerful brake, capable of giving retardations up to 9 ft. per second, and, therefore, especially suitable where the service demands high speeds with frequent stops amid thick traffic. The magnetic track brake with auxiliary blocks applied to the rail-head is at present in a somewhat experimental state, and is evidently capable of further development, especially in the direction of utilising blocks having a higher coefficient of friction against the rail than the magnetised blocks.

The question of sanding gear is then dealt with in a similar way, and the next section of the report itself sets forth a proposed scheme for the efficient training of tramcar drivers.

The general conclusions of the Committee are summarised at the end of the report as follows:—

All cars should be fitted with two brakes. Where quick and frequent stops are necessary (the usual conditions of urban lines), one of these should be a power brake. Where traffic is light and the maximum speed low, both types may be manually applied, but where steep gradients exist, only one of these should be dependent on wheel adhesion. The combination of wheel and slipper brakes accompanied with a regulation for a compulsory stop for the application of slipper brakes before descent of a severe gradient, meets this condition.

The power brake when fitted should be the service brake, as quick application and release are essential features in a service brake, and as full retardation can be obtained without the exercise of great physical effort. The power brake best suited to the general requirements is one which will give a powerful and easily moderated force for ordinary service stops, and which can apply, when necessary for emergency stops, a force equal to half the car weight instantaneously and continuously to slipper blocks. Where a magnetic track brake is in use on very steep gradients, an attachment for manual application is recommended.

In regard to the best position of brake blocks on wheels, there are practical difficulties in carrying these above the horizontal, and the Committee fail to see that there is any advantage in such a position. The most important point is the stiffness of the brake hanger. The links should be so arranged as to prevent the brake blocks from lifting. The methods of adjusting brake blocks in some cases are rather crude, and require improvement. In many instances the trucks used under the cars are mechanically weak in design, and are unsuitable for cars run at high speeds where powerful brakes are necessary.

Motormen should not be allowed to adjust the brakes of a car when in service. On all tramway systems there should be a man responsible for the state of the brakes on every car, and a frequent and systematic examination of all brakes should be made.

The power of all brakes being dependent upon the condition of the rail, the sanding apparatus should be absolutely reliable. On steep gradients the rails should be kept clean and sanded. There should be two sand boxes at each end of the car. Curved sand pipes should be avoided. Sand should be sharp, clean, and dry.

All motormen should be medically examined on engagement, and re-examined at intervals of not less than five years. A course of training is recommended, and motormen should be periodically re-examined in their work.

On narrow gauge lines, having sever gradients and sharp curves, the use of double deck cars, especially with top covers, is inadvisable.

Particulars of a very large number of tests are contained in appendices to the report.

ACYCLIC GENERATORS

A GOOD deal has been written both for and against the adoption of acyclic, or, as they are sometimes designated, unipolar or homopolar machines, for some classes of continuous-current work, and an article by Mr. J. E. Noegerath, in the *Electrical World* (New York), is of interest as giving some particulars of what has actually been done in the construction of machines of this class. The machines referred to have been built by the General Electric Co., and have all been in commercial operation for at least eight months. They include a 6-volt 8,000-ampere machine running at 1,200 r.p.m., forming part of a motor generator, a vertical shaft steam turbine-driven 2,000-kw. generator, for working simultaneously at 200, 250, 300, and 600 volts for electrolytic purposes, and an experimental acyclic direct-current auto-transformer, capable of converting from 125 volts to 6·25 volts, and multiples thereof, and *vice versa*. The latter machine is probably the first acyclic machine that ran as a motor, and the first direct-current rotary auto-transformer. An illustration is also given in the article of two 500-kw. turbine-driven acyclic generators supplying energy to a three-wire, 600-volt system, having a combined lamp and motor load.

The principle underlying these machines is shown diagrammatically in Fig. 1. The main factor influencing the design is

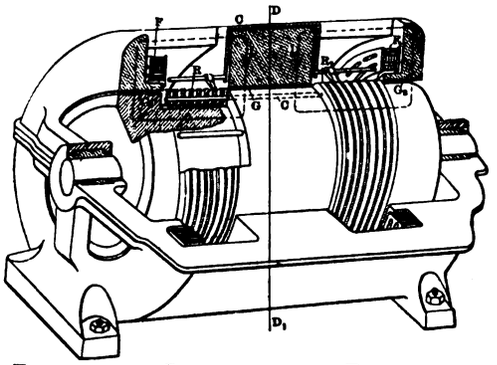

FIG. 1.—DIAGRAMMATIC SKETCH SHOWING PRINCIPLE OF ACYCLIC GENERATOR.

high peripheral speed. While this may appear at first glance to be a great disadvantage, embodying such problems as the collection of current at speeds up to 25,000 ft. per minute, high centrifugal stresses, and so on, it has been the endeavour to benefit rather than to lose by these extreme conditions.

Investigation covering a wide range of conditions have served to show that at high speeds the losses due to the collection of current do not increase appreciably with increasing speed, provided the windage is kept within limits, while, on the other hand, the excellent ventilating facilities reduce the required cooling surfaces. Moreover, the high speeds permit of very simple connections on the revolving conductors, where excellent contacts are guaranteed by the centrifugal force making it even possible to do away entirely with soldered contact on the revolving parts.

The stationary frame consists of solid steel castings of a cylindrical shape having two rows of large openings and two rows of small openings; the large openings are used for the inspection of the collecting system and the small ones carry off the hot air which is thrown out between the collector rings. The air is guided from the collector rings to these small openings by means of deflectors. The size of the small openings is determined, on the one hand, by the current output of the unit (size of the brushes), and, on the other hand, by the core losses. The stationary conductors are fastened on the outside of the frame, and the whole winding is so arranged that by changing these few frame conductors the voltage rating of the generator can be changed without affecting the kilowatt output. The efficiency of the material of the field coils is high because of the excellent ventilation possible, the copper being cooled by fresh air received directly from the armature, as is apparent in Fig. 2. The field-winding spools on the vertical machines are suspended from keys inserted in the frame. Special coils are used at the bearing for the purpose of counteracting the stray fields, which tend to convert the shafts into small acyclic generator armatures. The heavy currents which otherwise would be produced therein would be short-circuited through the bearings and tend to destroy them. However, this action is effectively neutralised by the auxiliary coils.

The main features of the armature spider are that all of its material carries flux. It is a solid casting, well ventilated, and of simple construction. It carries no binding wires or bands of any kind. The air for ventilation enters at the ends through axial ducts, and is led into a cylindrical chamber, from which the radial ducts propel it outward. The cylindrical reservoir is formed by a division of the armature spider into two castings which are separated for a distance under the collector rings.

On horizontal machines there is provided an adjustable ring assembled on the outside of the armature spider, and arranged so that the gap between this ring and the stationary part can be adjusted, thereby obtaining a perfect balance of the magnetic side pull. Instead of this arrangement a stationary ring can be used.

From the point of view of an armature-winding department no winding is used on the armature. If the importance of electrical design with regard to core losses and armature reaction are properly taken into account, and the distances between the adjacent conductors and between the conductors and the air-gap are properly selected, there can be used as armature conductors studs insulated by tubes of suitable material. In some instances the armature conductors form part of the collector studs, while in others they are separate.

Various different methods can be used for the support of the collector rings. In larger machines, where the axial expansion of the collector rings comes more prominently into action, the design shown in Fig. 2 is used. The supports, *A*, have flanges, *B*, which are elastic and of such proportions that they give rigid support to the weight of the collector rings, but are sufficiently flexible to allow of bending when put under the strain which occurs, because, when operating, the axial expansion of the collector rings is greater than that of the shell on which the collectors are mounted. The collector rings form a unit with the collector shell, and the collector studs. It has been found that copper brushes wear away with too great rapidity at the high peripheral speed, and a more durable form of brush of two special metals has been developed. The number of brushes used on a 2,000-kw. 300-volt generator is 96.

In the actual running of these machines they have been found to resist damage under short circuits exceptionally well, as the only limits are thermal, and the machines are of large heat capacity. It is stated that the voltage regulation under sudden changes of load is better than with ordinary machines, as changes in the flux, in the solid castings of which the machines are composed, are sluggish.

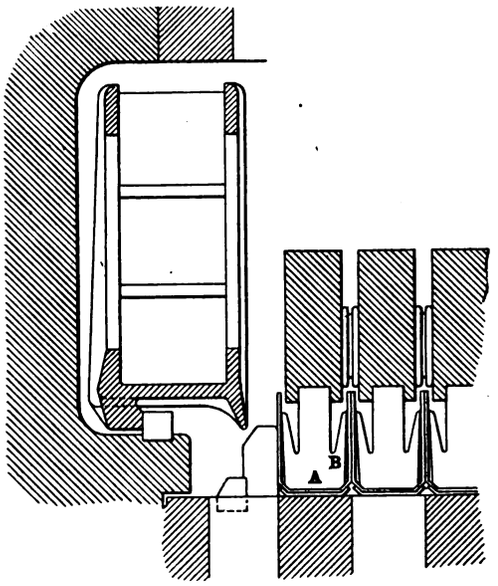

FIG. 2.—FIELD COILS AND COLLECTING RINGS OF ACYCLIC GENERATOR.

The field of application is in a general way conditioned more by the drive and the voltage than by the character of the service; that is, very small units can be built commercially only for low voltages, while for large units voltages higher than common direct-current practice prescribes can readily be obtained. There are, however, other conditions which may be favourable to the design, such as the necessity for a wide range in voltage, or a high flywheel effect, &c. In any event, it is

Digitized by Google

essential for the prime-mover to be a high-speed machine, whether it be a steam turbine, a water wheel, or an electric motor.

It is to be regretted that no particulars of weights are given in the article, as it has been argued by some that the weights and corresponding cost of these machines would be commercially prohibitive.

ELECTRICALLY-DRIVEN BRASS AND COPPER ROLLING MILLS

A PAPER was read on this subject before the Birmingham Association of Mechanical Engineers on Saturday last by Mr. C. A. Ablett, of Messrs. Siemens Brothers' Dynamo Works, Ltd.

In the first part of the Paper, the advantages of converting a steam mill to electric driving were pointed out. The advantages claimed were:—(1) economy of working; (2) saving in space; (3) greater output from existing plant; (4) great reliability and freedom from breakdown; (5) easy extension; (6) easy measurement of power taken.

With regard to saving in space, the author stated that assuming the supply to be obtained from the Corporation H.T. mains, the saving in space for a 500 h.p. plant would amount to 2,000 square feet if electricity be used in place of steam, and that such space could be used for 8 or 10 additional rolls. An increased output of 20 per cent. was mentioned as being the result obtained by the introduction of electric motors owing to the steady and uniform speed obtained. In order to check the power used by a mill it was recommended that an indicating ammeter, calibrated in h.p., should be supplied with each motor, as well as an integrating meter for all large motors and separate departments. In this way careful records can be kept of the units required per ton rolled.

The second part of the Paper was taken up with a description with diagrams of the transformers, motors, and switchgear, &c., which would be required for a mill taking its supply from the 5,000-volt mains of the Birmingham Corporation. The author recommends that motors of 100 h.p. and upwards should be run direct off the 5,000-volt mains, and thus save transformation losses. Liquid type starters were recommended for large motors, and views of several, including one for 1,000 h.p., were shown on the screen.

The rules of the Birmingham Corporation require that no fluctuation of current shall take place which corresponds to more than 25 amperes in the H.T. circuit; this represents a fluctuation of approximately 250 h.p. The author showed how the peaks can be very greatly reduced by the provision of a flywheel, the necessary change of speed being obtained by means of a slip resistance in the rotor circuit of the motor, the slip resistance being either permanently in circuit or else automatically inserted as the current increases.

A detailed comparison between the steam and electric drive was then made, in which the great overload capacity, the high efficiency over a wide range of load, and the ready response to varying demands for power of the electric motor, was well brought out. The Paper concluded with some remarks on the connecting up of motors to various types of rolls, by ropes, belts, and spur gearing.

The author gave some interesting details, illustrated by lantern slides, of some typical electrically-driven rolling mills. Perhaps the most interesting of these is a large reversing cogging mill in Germany, driven by a 7,000 h.p. motor. This mill rolls ingots of about 23 inches square section, and 5 tons weight. The rolls are 35½ inches diameter, and the mill turns out 60 tons per hour, and runs at 60 r.p.m. The motor can be reversed from 60 revs. in one direction to 60 revs. in the other direction, 28 times per min. This motor is supplied with power from an Ilgner converter set, driven by a 1,300 h.p. motor running at from 340-450 r.p.m., and although the power of the rolling motor is continually varying from 0-7,000 h.p., the power taken from the generating station is maintained by the converter set at the steady value of 1,300 h.p.

The discussion was opened by Mr. R. A. Chattock (Chief Electrical Engineer, Birmingham Corporation), who stated that 4,000 h.p. of rolling mill motors would be connected to his mains by the end of the present year. Mr. Chattock said that in the case of one mill, the drop in engine speed used to amount to 50 per cent. on heavy loads, whereas since the introduction of electric motors the drop had never exceeded 5 per cent. As regards cost, the figures obtained from several recently-converted mills proved that the electric drive was from 10 per cent. to 30 per cent. cheaper than the old steam drives.

A large number of members took part in the discussion, amongst whom were several rolling mill managers; most of these gentlemen bore testimony to the superiority of the electric drive, but it was stated that unless current could be supplied at a lower price than ¾d. per unit there was no economy over the steam drive.

THE FIRE ON THE METROPOLITAN RAILWAY AT SWISS COTTAGE

Board of Trade Report

MAJOR PRINGLE'S report to the Board of Trade on the slight fire which took place on October 6th in a passenger train at the Swiss Cottage station of the Metropolitan Railway has now been issued. The cause of the fire is shown to have been non-electrical, and due to the proximity of a lighted lamp to certain vessels in the train containing naphtha. At the conclusion of the report Major Pringle calls the attention of the company to the following matters:—

(*a*) The inadvisability of conveying naphtha, or naphtha lamps, in passenger trains, especially on the underground sections of their system.

(*b*) Where it may be absolutely necessary to do this, I suggest that, in addition to the precaution prescribed by the rules of having someone travelling in charge of the spirit, the luggage compartment should be ventilated as freely as possible, by having the side doors left open.

(*c*) In the case of a fire occurring in an underground station, all passengers should be hurried out of the train, and out of the station, and should not be permitted to return until all danger from fire or smoke is over.

(*d*) No extincteurs are, I understand, carried on passenger carriages. Although these may not be of great utility in the case of electrical fires, they have been proved effective, if used early enough, in the case of ordinary fires, and on this account should, in my opinion, be carried.

(*e*) It is to be regretted that the company have not made more use of non-inflammable woodwork and materials in the construction of their electric cars. For example, it would be possible to line luggage compartments with metal instead of soft wood, to provide asbestos millboarding to the single deal roof, and to render the interior fittings of passenger compartments, panels, seats, &c., less combustible by submitting them to some protective process. The elimination of wooden platforms in underground stations is also very desirable. These are all matters dealt with in the Requirements of the Board of Trade for new underground electric railways, and call for due consideration by the company.

In this connection the following notes on the construction of the cars, taken from the earlier portion of the report, are of interest:—

The car was divided into three parts by partitions. In front was the usual motorman's cab; in rear of this a luggage compartment, about eight feet in length, and of the full width of the car; the remainder was fitted on each side with the usual upholstered seats for third-class passengers. The floor of the car throughout is made of iron sheeting. All round the outside of the body, steel panelling is fixed between the floor and the level of the windows sills. In the passenger portion of the car there is a coating of cement to the flooring. The window frames and inside lining are of oak, and there is a double deal roof with an inside lining of asbestos millboard. The seats have steel frames covered with stuffing and upholstering. In the luggage compartment oak battens, spaced at intervals, are screwed to the iron floor. The inside lining is of deal with oak framing, the roof being single of bare pine. The doorway leading into the passenger compartment is solid oak. The motorman's cab is lined, roof and sides, with uralite. None of the timber-work, upholstering, &c., had been rendered non-inflammable by any treatment.

Machine Tools.—Messrs. Drummond Brothers, Ltd., of Guildford, inform us that they have just received a large order for the motor repairing works of the Morvi State, India. Included in this equipment are two special motor repairing lathes, one of the medium light type, 5 in. self-acting, sliding, boring, surfacing, and screw-cutting lathes, and one of the firm's new heavy high-speed all-geared head, self-acting, sliding, boring, surfacing, and screw-cutting lathes, this latter tool being fitted with quite a novel form of turret, which, when affixed to the saddle, converts the lathe into a full self-acting Hexagon turret lathe, capable of rapidly producing any work required in quantities, such as standard bolts, studs, pins, &c., which cannot be quickly procured up-country in India.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 5th, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

1907 Patents

22,756. **Train Lighting.** E. M. PRESTON AND A. E. KENNARD. (J. STONE & Co., LTD.). This specification describes an improvement in the system of train lighting developed by this firm, which causes the correct connections to be made between dynamo and battery when the train is started, irrespective of the direction of travel. This is effected by the use of a loose brush-rocker, the friction between brushes and commutator being utilised to move the rocker to one side or the other, according to the direction of rotation. By this means alternate contacts are opposed to the contacts on the centrifugally operated switch, with different directions of travel. In the case of a double-battery system, the brush rocker also operates a change-over switch. Seven claims, eleven figures.

23,138. **Series Transformer System.** A. F. BERRY. In the alternating-current distribution system, known as the "Berry" series transformer system, and described in ELECTRICAL ENGINEERING, Vol. III., page 197, a small transformer for light loads is short-circuited when the load on the same is large enough to be taken up by the main transformer. The present invention consists of a method of protecting this small transformer from overload (when the automatic change-over device fails to act), by suspending a silk thread over the high-tension fuses. When this is destroyed, owing to the heating of the fuse, a weight or lever is allowed to fall and cause the transformer to be short-circuited. Four claims, two figures.

23,148. **Multiple Carbon Flame Arc Lamp.** JOHNSON & PHILLIPS, LTD., AND C. F. TUBBS. A flame arc lamp, with two or more pairs of carbons burning simultaneously, is described in this specification. The arcs are arranged in series, and the upper carbons, which rest on stops, are fed forward by gravity. Each carbon holder is suspended by means of a flexible cord over a pulley, and the separate pulleys are mounted on rocking frames which are linked together by an equalising device to compensate for unequal burning of the carbons. Three claims, six figures.

23,224. **Single-phase Traction System.** V. A. FYNN. This is a system of electric traction in which the single-phase current collected from the overhead conductor is converted into two- or three-phase current by means of a motor generator. Asynchronous motors are used, and speed variation is obtained by the insertion of resistance in the rotor circuits, or by cascade or pole-changing connections. Resistance is also inserted at starting. A number of modifications of the system, and various methods of improving the power factor are also described. Eighteen claims, seven figures.

23,774. **Cable or Wire Connector.** P. GRAETZER. A connector for cables or wires is described in this specification. It consists of a casing closed at one end, and internally conical towards the other end, which is perforated to admit the wire. A tubular internal piece, into which the wire enters, is pushed towards the narrow end by means of a spring, and metal balls inserted in perforations in the sides of this tubular piece, grip the contained wire. To release the wire, the internal piece is drawn to the wide end of the casing, which operation releases the balls. Six claims, thirteen figures.

1908 Patents

1,546. **Armature Windings for High Speed C.C. Machines.** THE PHŒNIX DYNAMO MANUFACTURING CO. AND R. POHL. This invention relates to the mounting of the end connections of the armature windings of high-speed continuous-current machines, in which connections are brought from the armature winding, through the centre of the armature core, to additional segments of the commutator, in order to decrease the voltage per segment. The commutator end is to some extent imitated at the other end of the armature, in that lugs are brought down from the main armature bars to a number of insulated segments, clamped together by conical end rings. The auxiliary bars below the core are also connected to these lugs. The equalising rings may be arranged close to the segments, and may be connected to the lugs by short bars. To produce a cooling draught the lugs may be arranged as fan blades. Six claims, five figures.

5,387. **Manufacture of Metal Filament Lamps.** A. G. BLOXAM. *(Siemens & Halske Akt.-Ges.).* According to the process described in this specification, compound filaments, consisting of an internal core of tungsten or other non-ductile metal, surrounded by a skin of ductile metal, after having been drawn down to the required diameter, are extended on the supporting frame, and fixed to the leading in wires. The whole is then inserted into the lamp bulb, and the bulb is connected to the exhaust pump. By raising the filament to incandescence, the volatile outer skin is distilled off, and the tungsten core only remains. Any deposit is cleaned away with acid. Two claims.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

22,667, BROWN. Lifts or hoists.
22,719, BOULT (*Woodbridge*). Switchgear.
22,850, NALDER BROS. & THOMPSON, LTD., & NALDER. Indicating thermometers.
23,144, LOTZ. Transformers and converters.
23,145, COWPER-COLES. Apparatus for purifying electrolytes.
23,215, DEUTSCHE BECK-BOGENLAMPEN GES. Electrodes for arc lamps.
23,280, GARRARD & FERRANTI, Ltd. Protective devices.
23,429, GROTE, & FOSTER ARC LAMP AND ENGINEERING CO. Electrodes for arc lamps.
23,432, BERRY. Alternating-current distributing systems.
23,441, VON NIKOFOROFF. Means for amplifying feeble currents applicable to telegraphy and telephony.
23,449, BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) Circuit breakers.
23,609, LAKE (*International Telemeter Co.*). Signalling systems.
24,096, SCHOOP. Welding aluminium.
25,026, COCKSHOTT & MALEY. Magnetic brakes.
25,272, EVANS (*Allgemeine Elektricitäts-Ges.*). Electric welding.
26,179, LE TALL (*Lederer*). Manufacture of hollow metal filaments.
28,595, MITCHELL. Brake for tramcars.

1908 Patents

286, EISENSTEIN. Wireless telegraphy or telephony.
880, BOULT (*Benjamin Electric Manufacturing Co.*). Lamp sockets.
1,770, BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*). Dynamo-electric machines.
3,891, STRANGE. Rotary floor surfacing, scrubbing, and polishing machines.
4,847, WAELDE. Insulating composition.
7,563, RICHARDSON. Construction of steam turbines.
7,930, EBNER. Ignition devices.
8,895, HOLDEN. Electrical firing mechanism for breech-loading guns.
8,968, SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*). Electrical control of railway points.
9,128, GRIMLER & NEYLAND. Flexible lamp stands.
9,962, PEGLEY, PEGLEY, & GRIFFIN. Tram rails.
11,119, BACHTEN & GALLAY. Lighting dynamos for motor cars and other vehicles.
11,330, BRENTA & HOOSEMANS. Combined motor-driven band saw, roughing, and planing machine for wood.
11,600, RITTERSBERG & RUBERT. Filaments of Chinese ink for electric lamps.
13,761, GHILARDUCCI. Electrostatic machines for Röntgen rays, electro-therapeutics, and wireless telegraphy.
14,480, HOLMES & ALLEN. Trolley-heads.
14,667, SCHEING & HOFMANN. Rail joints.
15,079, ARON & GEIGER. Method of decarbonising filaments for metal filament lamps.
15,262, Firm of ROBERT BOSCH. Ignition apparatus for large internal-combustion engines.
16,534, COOLIDGE. Manufacture of refractory conductors.
16,775, HÄGI. Pedestal or socket for poles carrying electric conductors.
17,456, GRAETZER. Insulating and gripping devices for electric conductors.
18,755, ZAHRINGER. Magneto-electric ignition apparatus.
19,501, EBNER. Condenser for electric ignition apparatus.
19,891, SIEMENS BROS. DYNAMO WORKS, Ltd., & KIEFFER. Commutator cooling methods.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

21,667, MARTINI. Suspending and projecting device for incandescence bodies with extensible sleeve ring.
21,761, ALLGEMEINE ELEKTRICITÄTS-GES. Device for cooling commutators by means of wing-like projections on the segments.
21,826, PETERSEN. Suspended railways.
21,957, FELTEN & GUILLEAUME LAHMEYERWERKE AKT.-GES. Transporting apparatus.
21,959, MOSCICKI. Apparatus for producing oxides of nitrogen.

ELECTRICAL EQUIPMENT OF A LARGE STEEL WORKS

A DESCRIPTION is given in the *Electrical World* (New York) of the equipment in course of erection at the new steel works of the Indiana Steel Company, at Gary, Indiana, which is a fine example of a large steel works using electrical power entirely derived from gas engines driven by blast-furnace gases. When complete the works will comprise 16 furnaces. Very complete arrangements are made for removing dirt from the gas which passes necessarily through two dry-dust catchers, two water "scrubbers," and a Thiessen rotary washer.

The sixteen blast furnaces produce about 44,900,000 cu. ft. of gas per 24 hours, equivalent, when used in gas engines, to 500,000 b.h.p. Of this quantity approximately 30 per cent. is taken for heating the hot-blast stoves, 7½ per cent. is diverted to steam-boiler furnaces, 5 per cent. is consumed by various auxiliaries or lost in the process of cleansing, 12½ per cent. operates the gas-engine-driven blowers, and 45 per cent. supplies the electrical power station.

In the power station, which is 966 ft. long and 105 ft. wide, are installed 17 horizontal, twin-tandem, double-acting gas engines, running at a speed of 83⅓ r.p.m., 15 of which are designed for coupling to alternating-current generators and two to be connected to direct-current generators. The former are 25-cycle, three-phase, 2,300-volt machines, and the latter deliver current at a pressure of 250 volts. The engines have a rating of 4,000 h.p., and the generators are rated at 2,000 kw., but they are capable of carrying continuously 30 per cent. overload. The 17 units were built complete by the Allis-Chalmers Company. The gas engines are said to be the largest in the world to operate on blast-furnace gas. The floor space occupied by each engine is 70 ft. × 44 ft. The cylinders are 44 in. × 54 in. stroke, the crank pins are 20 in. in diameter, the shaft is 30 in. in diameter in the bearing, and the fly-wheel is 23 ft. in diameter, and weighs 200,000 lb.

The electricity generated will be distributed throughout the works and used to operate the heavy induction-motor-driven rolls, some of the motors for which are as large as 6,000 h.p., the tilting and feed tables for the various passes, the hot saws, hot and cold pull-ups, hot rolls, transfer tables, straightening and drilling machines, cold saws, elevators, conveyors, pumps, and other machinery. In order to deal with variations of load and to take advantage of as much of available power in the gas at all times, a large battery installation has been put in. The control of the battery charge and discharge in respect to the 250-volt direct-current bus-bars is effected by means of two motor-driven boosters, the field excitation of which is controlled by a carbon regulator with its solenoid in series with the total output of the direct-current generators. The fluctuations of load on the alternating-current circuit are transmitted to the battery by means of a split-pole converter designed to hold the constant alternating-current voltage while permitting a sufficient range of direct-current voltage to cause the battery to charge from or discharge into the alternating-current circuit through the converter. The field control of this converter, to effect this variation in direct-current voltage, is accomplished by a special alternating current-direct current exciter, which corresponds to the energy component of the alternating-current output from the alternators.

The motor equipment in the various mills is very extensive. In the open-hearth buildings the travelling and fixed cranes are electrically operated. There is a 125-ton crane in the casting department and another in the charging side, and the ladles used in pouring off are rated at 80 tons. The rail mill is equipped with 12 sets or stands of roll trains, all operated at varying speeds by General Electric alternating-current motors, some of which are of the largest sizes ever constructed for industrial service. These are housed in a separate bay, running parallel with the rolls. The rotors are 20 ft. in diameter, and have a speed of 83 r.p.m. All of the motors are connected directly to the roll trains by regular mill coupling. The aggregate driving capacity is 24,000 h.p. Although the motors are provided with fly-wheels and operate in one direction, provision is made for reversing in case of necessity. The control system has been worked out with the greatest nicety, all operations being under the instant control of the operator by means of a master controller.

In the rail mill a number of Cutler-Hammer automatic remote-control devices are installed, the most interesting of which are those designed for the control of the elevating and tilting tables, the bloom shear and the transfer. The elevating table on the 48-in. blooming mill, weighing about 250,000 lb., is supported on bell cranks which are connected to a rotating crank driven by a 250-h.p. motor running at 150 r.p.m. By means of automatic controlling devices the movement of a master lever starts the table from the low-level position and raises it to the highest level, where it is automatically stopped. In lifting the table from the low to the high level, the rotating crank moves through an arc of 180°, and, on throwing the master lever to the reverse position, the crank revolves another 180° in the same direction, bringing the table to the low level once more. The operation of raising or lowering the table can be accomplished in a period of two seconds, which is quite remarkable when the masses to be accelerated, slowed down, and stopped are considered. Its arrangement is similar to that of the elevating table, one end being pivoted and the other end supported on a bell crank. The tilting table is driven by a 150-h.p. motor controlled by a controller similar to that designed for the elevating table.

Automatic controllers installed in connection with motors on the transfers make it possible for the operator to transfer the rail from one table to another by a simple throw of the lever, the motor being automatically stopped after the transfer has been completed. For the operation of cranes, tables, and other apparatus, in and about the rail mill, requiring direct current, two 500-kw. synchronous motors driving direct-current generators have been installed.

LOCAL NOTES

ABERDEEN: *Trackless Trolley System.*—The possibility of the trackless trolley for certain outlying districts, is being considered in Aberdeen. The Tramway Committee have before them a report of the recent Manchester deputation which visited the Continent.

AMBLE: *Electric Lighting Order.*—The Board of Trade have revoked the Amble Electric Lighting Order of 1902.

AUSTRIA: *Electric Power Supply.*—A Reuter telegram from Vienna states that some English, French, and Hungarian capitalists have combined to build an electric power station at Fiume with a capacity of 36,000 h.p. to supply Abbazia, Fiume, and the Dalmatian towns with electric power and light. The cost of the installation is said to be about £1,000,000.

BACUP: *Tramways.*—Considerable progress is being made with the construction of the tramway system, most of the track work having been completed.

BATH: *Purchase of Electric Light Works.*—The special sub-committee which has had in hand the negotiations with Mr. Schenk for the purchase of the municipal electricity undertaking, has reported that satisfactory information has been provided as to the constitution and arrangements for capitalisation of the Bath & District Electric Supply Co., and also as to the local representations on the board of directors of the company.

BOMBAY: *Tramway Company.*—An additional 1,000 kw. turbo-generator is being installed by the Brush Electrical Engineering Co. The Brush Co. is also building a new power station for the Tramway Co. at Kussara.

BO'NESS: *New Generating Plant.*—An additional 300 kw. generating set, together with the necessary switchboard additions, was put into operation by the National Electric Construction Co. last week.

BRADFORD: *Fog Signalling on Tramways.*—Major Pringle will shortly visit Bradford in connection with some apparatus invented by Mr. C. J. Spencer, for use upon the tramways in foggy weather.

BRUSSELS: *International Exhibition.*—An International Exhibition is to be held at Brussels during the year 1910. The exhibition will be of an official character, and will receive the support of the Belgian Government, being under the control of the Belgian Department of Industry and Labour. The company formed for the financial and commercial arrangements has a capital of £106,000 divided into 2,650 shares of £40 each. His Majesty's Government, as well as those of France, Germany, the Netherlands, Spain, Italy, Greece, Persia, Bolivia, the Dominican Republic, Haiti, the Republic of Ecuador and Peru, have already decided to participate officially in the exhibition, and it is also hoped that the Governments of other European nations will join the movement.

BURSLEM: *Electric Lighting Charges.*—A good deal of discussion has been taking place in consequence of certain remarks by the Local Government Board inspector recently regarding the scale of charges now in force for the electricity supply. The Electricity Committee now recommend "That the question of the scale of charges for electricity be deferred until the decision

Digitized by Google

of the Local Government Board on the recent application for sanction to a loan had been received, and that a special meeting of the Committee be held as soon as such decision has been received."

CAMBERLEY: Electric Lighting.—With reference to the proposal of the Aldershot Gas Co. to apply for a Provisional Electric Lighting Order for this district, the local Chamber of Commerce has passed a resolution urging the Council to apply for such an Order itself.

CHATHAM: *Noisy Tramways.*—Complaints have been made to the Chatham and District Light Railway Co., with regard to the noise of their cars on curves. The Company reply that the only way in which this noise can be moderated is by increasing the radii of the curves.

CHICHESTER: *The Electrical Undertaking.*—A commencement has been made with the laying of mains by the Chichester Electric Light & Power Co.

CHRISTCHURCH (N.Z.): *Tramway Receipts.*—It is stated that the loss to date from April 1st, the commencement of the financial year, upon the municipal tramways system, is £309.

DOUGLAS (I.O.M): *Electric Tramways.*—The question of electrifying the Douglas Bay Tramways is to be put before the Council at an early meeting.

DUBLIN: *Electric Lighting Loan.*—A loan for £15,000 has been arranged with the National Association Friendly Society at 3¾ per cent., repayable in 30 years, for electric lighting purposes.

DUDLEY: *Purchase of Tramways.*—A sub-committee has been formed to consider the negotiations for borrowing the money for the purchase of the tramways. The Corporation will promote a Bill next session for carrying out the proposed arrangements with the British Electric Traction Co., and for confirming the proposed lease.

ECUADOR: *Telephone and Telegraph Systems.*—An American Consular report states that a telephone service is maintained in the city and suburbs, with long-distance connection with Guayaquil and other cities of the Republic. The long-distance service to Guayaquil is being reconstructed with modern equipment, and it is also reported that the city service will, at an early date, be replaced with new and modern telephones.

ELLAND: *Tramways.*—The West Yorkshire Tramways Co., which hold Parliamentary powers for constructing tramways between Halifax and Huddersfield, viâ Elland, have reported to the Council that the delay in commencing the construction is due chiefly to the disturbed state of the money market. The whole of the debenture capital, however, is now assured, and a considerable portion of the share capital also, but until the whole of the share capital has been either underwritten or subscribed, it was out of the question for any start to be made. The company has already expended £10,000 upon the project, and assure the Council that it will not be allowed to lapse.

ERITH: *London Power Bills.*—The promoters of the London & District Electricity Supply Bill have communicated with the Council, stating the terms upon which they would be prepared to enter into a contract for a supply of electrical energy in bulk. The Electrical Engineer has reported upon this offer, and the Electric Lighting and Tramways Committee now report to the Council that they think the proposal will be beneficial to the district.

GATESHEAD: *Tramway Receipts.*—The total receipts of the Gateshead & District Tramways Co., from January 1st, 1908, to date, amount to £43,818 against £43,665 for the corresponding period of 1907.

GILLINGHAM: *Wiring and Fitting.*—A sub-committee has under consideration the question of wiring and fitting houses let on a weekly tenancy.

GLASGOW: *Tramways Receipts.*—Since the commencement of the financial year on June 1st, the number of passengers carried on the Corporation tramway system is 93,531,344, and the receipts £380,553, against 95,545,097 and £387,029 respectively for the corresponding period of last year.

HANWELL: *Condition of Tramway Track.*—On behalf of the Board of Trade, Col. Yorke has inspected the track of the London United Tramways Co. in Hanwell. Col. Yorke has come to the decision that there are defects in the system, and would report that it was in a bad condition, and that certain repairs had been hurriedly carried out before his visit.

HASTINGS: *Sunday Trams.*—At the last meeting of the Corporation it was decided, in deference to the strongly expressed wish of the ratepayers, to agree unconditionally to the running of tramways on Sundays by the tramway company.

LONDON: *London County Council Tramways.*—An agreement has been come to between the City Corporation and the Highways Committee of the London County Council with regard to the widening of Bishopsgate Street Without, and the laying of tramways up to Liverpool Street. The County Council are to contribute £156,950 to the cost of the necessary street widening, the total cost of which is estimated at £313,900. It is calculated the widening will take about two years to complete.

London County Council Tramways Guide.—Messrs. Bell, Immison, Ltd., of Southport, have made an offer to the Council to issue the tramway guide free of expense to the Council on condition that the proceeds of sales be the property of the company. Subject to one or two modifications, this arrangement is recommended to the Council by the Highways Committee.

Battersea: London Building Acts.—In respect to a suggestion from the Borough Council as to the insertion of clauses in a General Powers Bill for the removal from the operation of the London Building Act, 1894, of electric service boxes placed in the public way by metropolitan electric lighting authorities, the London County Council have replied that they are of the opinion that the matter is one to be considered when the question of the general amendment of the London Building Acts is being dealt with, rather than in connection with a General Powers Bill. The suggestion has accordingly been noted for future consideration.

Hampstead: Street Lighting.—The Lighting Committee reported at the meeting on Thursday having considered the advisability of converting 100 incandescent street gas lamps in the Borough to electric metallic filament lamps. At present, however, they are not satisfied that the proposed change would be advantageous to the Council.

Kensington: Expenses of Delegates.—The Borough Council recently sent a circular letter to the other Borough Councils, asking their support in urging the London County Council to insert in a General Powers Bill a clause giving the Borough Councils power to incur reasonable expenditure in respect of the attendance of members and officials at electrical and other technical conferences having a bearing upon the performance of their duties. Of the 28 Metropolitan Borough Councils, ten signified being in favour of the proposal, six intimated that they were against the proposal, ten decided to take no action, while two had not passed any resolution on the matter. These facts were communicated to the County Council by Kensington Borough Council, and the hope was expressed that as only six of the Councils were adverse to the proposition, the Spring Garden authority would see their way to insert the suggested provision in their General Powers Bill of next Session. In reply the clerk to the County Council has written stating that his Parliamentary Committee regret that in the absence of any general desire on the part of the Metropolitan Borough Councils for the legislation in question, the committee could take no action to promote same.

MALVERN: *Trackless Trolley System.*—A syndicate proposes to apply for Parliamentary powers to authorise the use of the trackless trolley system in and around Malvern. If the powers are granted, the Malvern District Electric Traction Co. will be formed, and the scheme is being placed before the Council with a view to obtaining a supply of electricity. The matter has been referred to the Streets Committee.

OXFORD: *Tramway Question.*—The Tramways Committee are understood to be in favour of recommending the City Council to adopt a firm attitude towards the National Electric Construction Co. in connection with their proposal to substitute a combination of the conduit and overhead trolley system for the surface contact system originally contracted for, together with a reduction in the rent which the company has to pay. Whilst inclined to agree to the altered mode of traction, the Tramway Committee object to the reduction in the rent.

PANAMA: *Electrical Imports.*—A British Consular report, in giving a list of the principal articles of trade imported during the second half of 1907, draws attention to the fact that this shows many commodities in which the British Empire is not represented so well as it should be. Included in this list is electrical apparatus.

PERTH: *Prepayment Meters.*—A Committee has been appointed to consider the desirability of introducing penny-in-slot meters for electricity supply.

PRESTON: *Accident at Messrs. Dick, Kerr & Co.'s Works.*—In connection with the death of J. E. Johnson, who was killed at Messrs. Dick, Kerr & Co.'s works in September, the sum of £300 is to be granted to the dependents of the deceased.

RHONDDA: *Tramway Inspection.*—Col. Druitt, on behalf of the Board of Trade, inspected the final tramway route of the Council's system last week.

RHYL: *Light Railway Project.*—Mr. Stephen Sellon has had an interview with the Urban District Council with regard to a light railway scheme. It was stated that the Llandudno and District Tramways Construction Co. is prepared to undertake the work, and to take electrical energy from the Council. A proposal is to be made that the Council shall give its consent to the scheme, which will include a line to Prestatyn.

SALE: *Tramways.*—Notice is given of a proposal to lease the tramways in Sale to the Manchester Corporation for a term of 35 years, commencing July 30th, 1906. The amount of rent payable is progressive from £795 in 1906 to £1,410 in 1931. For each of the following ten years the rent and terms are to be agreed.

SANTANDER: *Electrical Works.*—New electric power works for public and private supply were opened in June last.

SOUTH AFRICA: *Victoria Falls Power Co.*—It is stated that an action has been commenced against the Rand Mines, Ltd., claiming specific performance of an agreement by that company to give the Victoria Falls Power Co. the preferent right of supplying power in bulk at rates equal to those quoted by any other competing power company.

Digitized by Google

SOUTHAMPTON: *Electric Lighting Extensions.*—An application is to be made to the Board of Trade for an Electric Lighting Provisional Order for North and South Stoneham.

SPAIN: *Bilbao Coke Ovens.*—A British Consular report states that during 1907 the Altos Hornos de Vizcaya Company built 25 additional coke ovens of the Semet-Solvay pattern. This company now have 244 coke ovens, viz., 144 Carvés system at Sestao and 100 Solvay system at Baracaldo. The electrical charging of the coke ovens at Sestao continues to give satisfaction, the whole quantity of coal to be carbonised in a single operation being introduced in one movement as a single homogeneous. pressed mass, the resulting coke being very much harder than that charged by the ordinary system.

Electrical Trade.—The same report states that in the north of Spain buyers are so accustomed to deal with German and Swiss firms only in the electrical machinery trade that it is difficult to make them believe that similar goods are manufactured in the United Kingdom; and the only practical way for securing any share of this trade is for British firms to combine to open branches in Spain carrying representative stocks, and with a staff of technical experts who can speak Spanish. The electrical machinery and motor trade in Spain possesses considerable potentialities, but British industry must adopt aggressive tactics to derive advantage from them.

Electric Lighting.—All the electric lighting companies in Bilbao and neighbourhood, with the exception of the Co-operativa Electrica (with 1,500 consumers), have united as one company under the name of Union Electrica Vizcaina, with a capital of 18,000,000 pesetas (£639,430), of which 16,000.000 pesetas (£568,383) have been issued.

SPALDING: *Electric Lighting Provisional Order.*—The Board of Trade has asked the Council what steps it proposes to take with regard to putting into force their Electric Lighting Order of 1905, before coming to a decision with regard to its revocation. The matter has been referred to the Gas Committee.

STOURBRIDGE: *Electric Lighting.*—A special meeting of the Council was held on Saturday to consider the question of electric lighting. A report upon the subject stated that for eight or nine years the Council possessed an Electric Lighting Order, but did nothing with it, the various Councils being unable to make up their minds whether to work it or lease it to a company. Twelve months ago it was leased to the British Electric Traction Co., and the matter had been in abeyance until a suggestion was made by the Midland Electric Corporation for Power Distribution for the cancellation of the Order of 1899, and the grant of a new Order on the application of the Council, all costs of which will be paid by the Midland Corporation. This arrangement between the Midland Electric Corporation and the British Electric Traction Co. was discussed at some length. Eventually the meeting was adjourned until next Wednesday.

SWEDEN: *The Electrical Industry.*—In a report upon the trade of Gothenburg during the year 1907, the British Consul states that the electro-technical industry enjoyed an intensive activity. The numerous large power works, resolved on in 1905, were begun in 1907, and the work was pushed on so well that some of the generating stations have been able to begin supplying current, while the others should be finished in the course of 1909. A large number of electrical works were completed last year in various towns, while new buildings or reconstructions have been decided on in other communities. Among other schemes may be mentioned the supply of electricity in Warburg, generated at an adjacent waterfall, whilst great activity is being displayed in laying down the electric plant at the River Lagan, which will give a general supply in Halmstad and other towns.

TORQUAY: *Electricity Undertaking.*—At the last meeting of the Council, it was announced that the final audit of the accounts for the past year showed a profit of £3,000. The new plant is being installed very rapidly, and the whole cost of it is being met out of revenue.

Tramway Extension.—A communication from the National Electric Construction Co., asking for the consent of the Corporation to an extension of the tramways to Paignton, has been referred to the Tramways Committee.

TURTON (near Bolton): *Electric Lighting.*—It has been decided to apply to the Board of Trade for an electric lighting provisional order.

WALLASEY: *Tramway Extensions.*—In connection with the proposed tramway extensions, estimates have been provided for alternative routes, the figures being £93,530 and £83,160. The Tramways Committee recommend the adoption of the latter.

WALSALL: *Electric Signs.*—The Electricity Committee has resolved to charge firms taking electric current for the purpose of illuminated signs at motor rates, provided they agree to keep the sign illuminated until midnight on six nights a week, and pay for the cost of renting a separate meter.

WATFORD: *Extension of Electricity Area.*—The Council have given notice of their intention to deposit a Bill in Parliament next session to authorise an extension of the area of supply for electric lighting and power purposes, to include portions of Cassiobury Park. The Bill will also include powers for wiring of houses, &c.

WEALDSTONE: *The Electric Lighting Order.*—The North Metropolitan Electric Power Distribution Co. have notified the Council, in reply to a communication, that as they are at present engaged with electrical undertakings in Tottenham, Edmonton, and St. Albans, involving a capital expenditure of over £78,000, they regret their inability to proceed with the Wealdstone Electric Lighting Order, but hope to be able to do so during next year. The Council have decided to recommend the Board of Trade to consider the question of revoking the Company's Order.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BRIDLINGTON.—A condensing plant is to be installed at an estimated cost of £1,100.

COLCHESTER.—An overhead cable is to be laid from the generating station to Hythe Quay at an estimated cost of £675.

HULL.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £24,000 for the purposes of the electrical undertaking.

LOUGHBOROUGH.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £2,500 for the purpose of the electrical undertaking.

LONDON: *Hammersmith.*—The Finance Committee of the London County Council recommends a loan of £10,000 for electric lighting purposes at 3¾ per cent. per annum, repayable in 20 years.

NEW ZEALAND.—A loan of £17,000 for extending the city electrical plant, including the cost of changing over to the three-wire system, the provision of two additional generating units, one balancer set, extra panels, and alterations to switchboard, alterations to connections, extension of distributors, 250 new wattmeters, foundations and new wing to building, and other necessary plant and materials has been sanctioned.

ST. HELENS.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £10,426 for the purposes of the electricity undertaking. There was no opposition.

S. AFRICA.—A public meeting has been held at Port Elizabeth to sanction the borrowing of £25,000 for electric light extension.

STORNOWAY AND LEWIS.—An electric lighting scheme, making use of water power, is under consideration. Mr. J. V. Bennett, consulting engineer of Edinburgh, is interested in the matter.

TORONTO.—It is stated that tenders will shortly be invited for a portion of the work in connection with the construction of the municipal electrical undertaking.

TYNEMOUTH.—A Local Government Board inquiry has been held last week into an application by the Corporation for sanction to borrow £4,251 for the purposes of the electricity undertaking.

Miscellaneous

ARGENTINE.—The construction of the following telegraph lines has been sanctioned:—(*a*) From Rio de las Piedras to Anta and Rivadavia; (*b*) from Ledesma to Oran; (*c*) from Salta to Cachi, Molinos and Poma. A sum of 150,000 pesos (about £13,000) has been set aside for this work.

AUSTRALIA.—Tender forms, specifications, &c., in connection with a call for tenders for the supply of cable-repairing plant required by the Postmaster-General's department may be seen at the Commercial Intelligence Department of the Board of Trade. Tenders to Deputy Postmaster-General, Melbourne, by January 26th.

BELFAST HARBOUR.—The Belfast Harbour Commissioners, before taking any further steps in connection with the proposed use of electric current for pumping the Hamilton graving dock, and electrically-driven pumps at the new graving dock, are consulting Messrs. Preece & Cardew as to a visit to the place.

CHATHAM.—Tenders are invited for stores for the Borough Surveyor's Department, including electric lamps, &c. Particulars from the Borough Surveyor, and tenders to the Town Clerk by November 19th.

DARLINGTON.—Tenders are invited by the 19th inst. for the erection of an electrically-driven centrifugal pump at the new water tower, Harrogate Hill. Particulars from the Town Clerk.

DOVER.—Two dozen chilled cast-iron electric car wheels are to be purchased at a cost of £32 8s.

GT. NORTH OF SCOTLAND RAILWAY CO.—Tenders are invited for the supply of stores, including electric lighting material, from Jan. 1st, 1909. Particulars from the Stores Superin-

Digitized by Google

tendent, 80 Guild Street, Aberdeen. and tenders by November 23rd.

HASTINGS.—A Local Government Board in quiry is shortly to be held concerning an extensive scheme of street electric lighting.

LEICESTER.—Tenders are invited for supplying and fixing transformer and metal filament lamps in four pavilions at the North Evington Infirmary for the Guardians. Particulars from the Clerk, and tenders by the 16th inst.

LONDON: *London County Council.*—The Council invites tenders for the roadwork and platelaying required for the electrification, on the conduit system, of the existing tramways from King's Cross *via* Pancras Road, Great College Street, and Kentish Town Road, to the western end of Prince of Wales's Road, and of the authorised tramways in Crowndale Road. Particulars from the Clerk, and tenders by November 17th.

London County Council.—An expenditure of £25,900 is recommended for the construction of the authorised tramways in Streatham High Road, and the reconstruction of the tramways in Woolwich Road.

The Highways Committee recommend an expenditure not exceeding £2,100 for the provision of ploughs for 175 cars.

MANCHESTER.—The Tramways Committee invite tenders for the supply of two steel boilers for heating purposes, also hard drawn copper trolley wire. Particulars from Mr. J. M. McElroy, General Manager, and tenders to the Chairman of the Tramways Committee by Nov. 17th.

SPAIN.—The *Gaceta de Madrid* of October 27th contains a copy of a Bill to be laid before Parliament authorising the Deputacion Provincial of Guipuzcoa to establish and work during a period of 35 years an inter-urban telephone system.

WAKEFIELD.—The Wakefield & District Light Railway Co. invite tenders for stores during the year ending December 31st, 1909, including the following:—Armature coils, &c., arc lamp carbons, carbon brushes, cables and wires, electric lamp fittings, &c., insulating materials, &c. Particulars from the manager, and tenders by Nov. 19th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.—School, Marner Street, Bow and Bromley. T. J. Bailey, Architect to L.C.C. Education Committee.

N.E.—Higher Grade School, Lauriston Road, South Hackney, 320 places (£11,773). T. J. Bailey, Architect to L.C.C. Education Committee.

Adaptation of Hoxton House, Hoxton, for temporary special school (£487). T. J. Bailey, Architect to L.C.C. Education Committee.

Two two-storey factories, Hackney. Architects, Hodson & Whitehead, 7 Finsbury Square, E.C.

Addition to warehouse, Hackney. Contractor, N. Fortescue, 215 Mare Street, Hackney.

N.W.—Proposed additions to Isolation Hospital, Willesden. W. J. J. Stewart, Medical Superintendent.

S.W.—Workshop at St. James's Road, Upper Tooting, branch workhouse. F. W. Piper, Clerk to the Wandsworth Guardians.

683 tenements and 53 lock-up shops (£150,000), near Marlborough Square, Chelsea, for Trustees of Sutton Estate. Architect, E. C. P. Monson, 182 High Street, Acton.

W.C.—Additions to Homœopathic Hospital, Queens Square and Great Ormond Street, W.C. Architect, E. T. Hall, 54 Bedford Square, W.C.

PROVINCES.

BIRMINGHAM.—Fire Station, Albion Street (£9,870). Builder, Thos. Elvins, Maden Road, Soho Hill.

BOURNEMOUTH.—Municipal Buildings (Amended Scheme, £19,560). Borough Surveyor, F. W. Lacey.

BRIGHOUSE.—School (£10,000). James Parkinson, Clerk to Town Council.

BURNAGE (Manchester).—School (500 places), for Education Committee. Sir Wm. Henry Talbot, Town Clerk.

CARDIFF.—Tenders are invited for installing the electric light in the Cardiff Museum. Particulars from the Town Clerk, and tenders by December 1st.

CHESTER.—Refuse Destructor (£10,966), at Electricity Works. J. H. Dickson, Clerk to Town Council.

DUDLEY.—High School for Girls, Prior Road. Surveyor to the Corporation.

LOUGHBOROUGH.—Technical Institute. Architects, Barrowcliff & Allcock, Town Hall Chambers.

LUTON.—New buildings and alterations and additions to sick wards at Workhouse. Architects, Gotch & Saunders, 55 George Street.

LYMINGTON (HANTS).—New school (£2,783). Clerk to Hampshire Education Committee, Winchester.

MANCHESTER.—Extension of Royal Exchange buildings. The Secretary.

NORWICH.—Secondary school and alterations to building, Eaton Road. Clerk to the Education Committee.

NUNEATON.—School (780 places). F. S. Clay, Clerk to Urban District Council.

SWANSEA.—Proposed new Art Gallery. Architect, Mr. Moxham (Wilson and Moxham), 39 Castle Street.

YEADING (UXBRIDGE).—Re-erection main block and wards of Smallpox Hospital. Builder, J. S. Brown, Hillingdon Heath.

TENDERS RECEIVED AND ACCEPTED

DUNDEE.—The tender of Messrs. Westwood & Sons for the wiring of the Central District School at £76 has been accepted.

KINGSTON.—The tender of Messrs. Siemens Bros. & Co. for cable, at £213, has been accepted.

LONDON: *City of London.*—The Guardians have placed an order with Pinching & Walton for one gross of 16 c.p. electric lamps at £5 5s.

Holborn.—The Council has received the following tenders for the electric light installation at the High Holborn Library:—John Bolding & Sons, Ltd. (accepted), £78; Barlow Bros. & Co., £196; Comyn Ching & Co., Ltd., £175; D. Hulett & Co., Ltd., £118; Marryat & Place, £170; Foote & Milne, Ltd., £101.

London County Council.—The following tenders have been received for the reconstruction of the bridge, carrying Mare Street, Hackney, over Regent's Canal in connection with the electrification of the Whitechapel Road to Stamford Hill tramways:—Dick, Kerr & Co. (£4.216 19s. 4d.), Cleveland Bridge and Engineering Co., Ltd. (£4.400 13s. 5d.), Alfred Thorne & Sons (£4.485 19s. 10d.), Andrew Handyside & Co., Ltd. (£4,566 14s. 1d.), Heenan & Froude, Ltd. (£4.652 2s. 11d.), John Cochrane & Sons (£4.833 8s. 5d.), Westminster Construction Co. (£4.960 14s. 1d.), John Mowlem & Co., Ltd. (£5.000). The tender of Messrs. Dick, Kerr & Co. is recommended for acceptance, subject to their giving preference to men resident in the County of London.

The tender of Messrs. Millars' Karri & Jarrah Co., Ltd., amounting to £1,012, for the supply of 100,000 Jarrah wood blocks required for use in the tramways department has been accepted.

ONTARIO.—The tenders for the electrical equipment and apparatus required by the Hydro Electric Power Commission are now being checked by the engineers. The Toronto correspondent of the *Standard* states that the tenders of the General Electric Co. of Canada and the Westinghouse Co. are the most favourably received, and there is a probability that the contract will be divided between these two companies.

PRESTON.—The tender of Messrs. Foster & Co. for a tramway shelter at the Penwortham Bridge terminus, has been accepted at £68.

SHEFFIELD.—A contract has been placed with the Warner Engineering Co. to equip twelve tramcars with their non-parallel axle trucks.

STALYBRIDGE, HYDE, &c.—The tender of Messrs. E. Wood & Co., Ltd., of Salford, has been accepted for the supply and erection of ironwork in connection with the boiler-house extensions.

WALSALL.—The Council have accepted the following tenders in connection with the electricity undertaking:—Templer & Ranoe, Ltd., 16-inch atmospheric exhaust valve for condensing plant, £27 5s.; Worthington Pump Co., Ltd., two 24-inch sluice valves, £42; John Spencer, Ltd., 24-inch exhaust steam pipes, £133 10s.; Lacy-Hulbert & Co., Ltd., portable air compressor for blowing dust out of the armatures, £49 10s.

COMPANIES' MEETINGS AND REPORTS

BERGMANN ELEKTRICITATS-WERKE A.G., BERLIN.—At an extraordinary meeting of the shareholders of this company, it was decided to increase the capital to 21,000,000M. by issuing 7,000 shares of the value of 1,000M. each.

BERLIN ELEKTRICITATS-WERKE.—The report, which will be presented at the annual meeting on November 30th next, recommends a dividend of 11 per cent. on the ordinary shares and 4½ per cent. on the preference shares. The number of customers have increased from 2,363 to 2,543, and the connected kilowatts from 14,907 to 17,538. The total useful output for the past year amounted to 155 million units, or 13 million units more than last year.

Digitized by Google

LANCASTER AND DISTRICT TRAMWAYS CO.—The report for the year ended September 30th shows a gross profit of £5, and after meeting interest on loans, &c., there is a debit balance of £1,301. Negotiations are proceeding between the company and the Corporation for the acquisition of the undertaking.

EASTERN EXTENSION, AUSTRALASIA & CHINA TELEGRAPH CO.—At the half-yearly meeting, on Tuesday, the report and accounts, given in our last issue, were adopted. Sir John Wolfe Barry, K.C.B., who presided, referred to the decision of the Australian Government to lay and work cables of their own between Tasmania and the mainland, which will have the effect of compelling the company to close its Tasmanian stations and remove the two existing cables unless a new arrangement is come to with the Government. This, however, he regarded as very remote, as the company was receiving from that Government nothing but unfair competition and continual attempts at oppression.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, quoted on Tuesday night, net c.i.f. port of arrival was £66 10s. to £67 5s. (last week £64 to 64 10s.).

AGENCY.—Mr. Harry Nance, 4 Church Street, Cardiff, is now representing for South Wales and West of England :— Pritchetts & Gold, Ltd. (London); Arc Lamps, Ltd. (St. Albans); Fuller Electrical & Manufacturing Co. (London); Birmingham Lighting Co. (Birmingham); Wm. Wadsworth & Sons (Bolton); Nalder Bros & Thompson, Ltd. (London); Newtons, Limited (Taunton); Ward & Goldstone (Manchester); Sunbeam Lamp Co., Ltd. (Gateshead-upon-Tyne).

CANADIAN INQUIRY.—The following was among the Canadian inquiries received at the office of the High Commissioner for Canada, 17 Victoria Street, London, S.W., this week :— "A New Brunswick correspondent wishes to secure the commission agency of some United Kingdom makers of telegraph wire, cables, &c."

CUSTOMS DUTIES.—The Board of Trade are in receipt, through the Foreign Office, of a copy of a Decree of the Provisional Governor of Cuba, reducing the Customs duty on wire and cables for the transmission of electricity, protected by lead tubes and other insulating covers, from 7·50 to 2 dollars per 100 kilogs.

THE DAVIES WATER-TUBE BOILER.—Mr. J. P. Davies, the inventor of the water-tube boiler, Patent No. 903 of 1907, and of other water-tube boilers, has obtained a declaration from the Chancery Division of the High Court in the action of Davies *v.* The Davies Patent Boiler, Ltd., 1908 D, No. 652, that he is entitled to the Patent No. 903 of 1907, free from all claims on the part of the defendant company, and that the company are not entitled to any interest in any invention in relation to boiler or boiler tubes made by Mr. J. P. Davies since November 14th, 1906, and an injunction restraining the company from setting up any claim thereto.

DISSOLUTIONS OF PARTNERSHIPS.—The partnership between V. C. Hemsley and Richard Ord, trading as Hemsley, Ord & Co., electrical engineers, 37 South Sherwood Street, Nottingham, has been dissolved.

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.— A meeting of the X Accumulator Co., Ltd., will be held at the offices of Messrs. E. Littlejohn, Wilson & Co., 85 Gracechurch Street, London, E.C., on November 18th, at 12 noon. Particulars of claims should be sent to Mr. W. J. Webb, liquidator, 18 Leadenhall Street, London, E.C.

Notice of a first and final intended dividend of 1 3-16d. in the £ is given in the bankruptcy of W. Wardle, electrical engineer, 14 Osborn Road, Levenshulme, Manchester. The dividend is payable on November 13th at the official receiver's office, Byrom Street, Manchester.

Notice of an intended dividend is given in the bankruptcy of W. T. Garnett, Barkerend Mills, Bradford. The last day for receiving proofs is November 19th. The trustee is Mr. E. Musgrave, 1 Bank Street, Bradford.

The X Accumulator Co., Ltd., is to be wound up voluntarily. Mr. W. J. Webb has been appointed liquidator.

MESSRS. SIEMENS BROS.' INTERESTS IN AUSTRALIA. —The *Australian Mining Standard* states that an agreement has now been concluded between the various branches of Siemens' firms by which their export business will be organised on definite lines, so that the interests of the various British and German firms will not conflict in the various parts of the world in which they do business. The firms concerned are :- Messrs. Siemens Bros. and Co., Ltd., of Woolwich and London; Messrs. Siemens Bros.' Dynamo Works, Ltd., Stafford and London; Messrs. Siemens Schuckertwerke, Berlin, Nuremberg, &c.; Messrs. Siemens & Halske, Berlin and Nonnendamm; Gebruder Siemens & Co., Berlin and Lichtenberg. This amalgamation, which represents a combine of nearly £12,000,000, has been arranged so that the whole of the industrial world has been allotted between the English and German interests.

SMALL TRANSFORMERS.—We are informed that the Firth Engineering Co. have made special arrangements for a largely increased output of small transformers for metal filament lamps, and have practically trebled their automatic winding machines. Particular attention is devoted to the testing as well as to the manufacture of this apparatus, and the firm are now able to give quick deliveries of small transformers in any quantity for any requirements.

LE CARBONE, LTD.—This firm, of Levallois-Perret, near Paris, who were awarded a Grand Prix for their exhibition of carbons of every kind at the Franco-British Exhibition, have issued a handsome souvenir of the Exhibition in the shape of a square medallion of moulded graphite of artistic design.

MISCELLANEOUS CITY NOTES

BRUCE PEEBLES & CO.—The scheme of reconstruction was formally approved in the Court of Session in Edinburgh on Tuesday. The scheme provides for the incorporation of a new company with a capital of £250,000 in £1 shares, to take over the property and assets of the existing company. Each debenture-holder is to receive a 5 per cent. mortgage debenture of the new company, and each ordinary creditor will receive for the sum for which he would rank, to the extent of ⅜ an unsecured 6 per cent. debenture, and ⅝ fully paid shares of the new company. Creditors of less than £10 may elect to receive 5s. per £1 on their claims in cash. The £5 preference shareholders in the old company are to have allotted to them three £1 shares of the new company paid up to the extent of 13s. 4d., whilst the £5 ordinary shareholders will be allotted £1 shares paid up to the extent of 10s.

MEXICAN LIGHT & POWER CO.—A circular has been issued, asking for proxies for a meeting to sanction the issue of new ordinary capital. The *Financial News* states that the Mexican Tramways Co., with which an amalgamation was nearly carried through, has guaranteed the issue of about £1,000,000 of debentures, ranking after the debentures now quoted, which will be used either for the purpose of the combined undertaking should the amalgamation take place, or for the purposes of the tramway companies alone.

REES ROTURBO MANUFACTURING CO., LTD.—Subscriptions have been invited during the week for an issue of 85,000 preference shares of £1 each at par in the Rees Roturbo Manufacturing Co., which, it will be remembered, has been formed to acquire the business of Messrs. Thomas Parker, Ltd., of Wolverhampton.

WEST INDIA & PANAMA TELEGRAPH CO.—Dividends of 6s. per share on the first preference shares for the half-year to June 30th, and 12s. per share on the second preference shares on account of dividends accrued to June 30th, have been declared.

APPOINTMENTS AND PERSONAL NOTES

Mr. S. Cameron Gibson, Borough Electrical Engineer at Nuneaton, has been presented with a handsome silver electric kettle and electric water heater by the staff at the electricity works on the occasion of his marriage, which took place recently. He is also the recipient of a marble chiming clock, suitably engraved, presented by the Town Council officials and staff.

COMPANY MORTGAGES

Particulars of the following mortgages and charges have been filed :—

LEAMINGTON & WARWICK ELECTRICAL CO.—Particulars of £35,000 debentures, created by resolutions of September 21st, 1906, and July 20th, 1908, have been filed pursuant to section 10 (3) of the Companies Act, 1907, the whole amount being now issued. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

LEICESTERSHIRE & WARWICKSHIRE ELECTRIC POWER SYNDICATE.—Issue on September 8th, of £150 debentures, part of a series of which particulars have already been filed.

A. REYROLLE & CO.—Particulars of £20,000 debentures, created by resolution of April 17th, 1907, have been filed pursuant to section 10 (3) of the Companies Act, 1907, the amount of the present issue being £500. Property charged—The company's undertaking and property, present and future, including uncalled capital. No trustees.

NEW COMPANIES

JAMES BUCKLEY.—This company was registered on October 24th, with a capital of £1,000 in £1 shares, to carry on the business of decorators, painters, sanitary, electrical, mechanical, and heating engineers, contractors, gas, steam, and water fitters, plumbers, glaziers, metal workers, &c. Registered office: 10 Greenacres Road, Oldham.

E. GOOSSENS, POPE & CO.—This company was registered on October 19th, with a capital of £1,000 in £1 shares, to acquire the business of electrical lamp manufacturers and merchants carried on by Emile Goossens, F. R. Pope, and M. W. O'Connell, as "E Goossens, Pope & Co.," and to carry on the same and the business of electricians, electrical engineers, &c. The subscribers are:—F. R. Pope, The Priory, Harlesden Road, N.W., electrical engineer; M. W. O'Connell, 35 Nicoll Road, Harlesden N.W., electrical engineer. Private company. The number of directors is not to be less than three nor more than four: the first are E. Goossens, F. R. Pope, and M. W. O'Connell. Qualification, £150. Registered office, 5 Arthur Street, New Oxford Street, W.

MARRYAT & McNAUGHT, LTD.—This company was registered on October 29th, with a capital of £5,000 in £1 shares (2,000 pref.), to take over the business of an electrical engineer carried on at Askew Villas, Askew Crescent, Shepherd's Bush, W., and to adopt an agreement with H. Harryat and C. J. McNaught. Private company. H. Marryat and C. J. McNaught are joint managing music directors. Registered office: Askew Works, 31A Askew Crescent, Shepherd's Bush, W.

NORTHERN ELECTRICAL & VENTILATING CO.—This company was registered on October 20th, with a capital of £5,000 in £1 shares (1,000 preference), to acquire the business carried on at Liverpool by C. P. Titherley and C. P. L. Titherley, as the "Northern Electrical & Ventilating Co." The subscribers are:—C. P. Titherley, The Limes, St. George's Road, Wallasey, electrical contractor; C. P. L. Titherley, Langtree, Piercefield Road, Freshfield, Lancs. Private company. The number of directors is not to be less than two nor more than five: the first are C. P. Titherley and C. P. L. Titherley, each of whom may retain office while holding 100 ordinary shares. Remuneration (excepting managing director, if any), as fixed by the company. Registered by T. T. Hull & Son, 22 Chancery Lane, W.C.

OLIVER, CLARK & CO.—This company was registered on October 21st, with a capital of £2,500 in £1 shares, to acquire the business of electrical and general engineers, smiths, metal workers, &c., carried on by A. J. Mileson, at 20A Goldhawk Road, Shepherd's Bush, and 24A St. Mark's Road, North Kensington, W., as "Oliver, Clark & Co." The subscribers are:—A. J. Mileson, C. O. Clark, T. H. Norman, A. S. Woodhead, W. G. Johnson, Grace Newson. Private company. The number of directors is not to be less than two nor more than five: the first are C. O. Clark (managing director), A. J. Mileson, and W. G. Johnson. Qualification, £25. Remuneration of ordinary directors as fixed by the company. Registered by Alfred H. Atkins, Ltd., 27-28 Fetter Lane, E.C.

SKEWEN FOUNDRY & ENGINEERING CO.—This company was registered on October 23rd, with a capital of £5,000 in £10 shares, to carry on the business of ironfounders, steel makers and converters, smelters, tool makers, manufacturers and factors of metal appliances, apparatus and goods for railway, tramway, telephone, electric and motor traction, &c. Registered by Alfred H. Atkins, Ltd., 27-8 Fetter Lane, E.C.

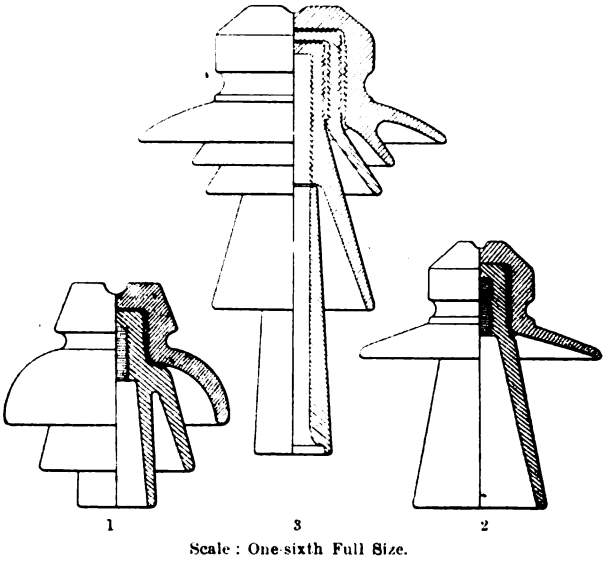
J. E. WOOD & CO.—This company was registered on October 23rd, with a capital of £500 in £1 shares, to acquire the business of hydraulic, electrical, and general engineers, &c., carried on by J. E. Wood and A. T. Richards at Radford Boulevard and Player Street, Nottingham. The first directors are J. E. Wood (permanent managing director), and A. T. Richards. Registered by Alfred H. Atkins, Ltd., 27-8 Fetter Lane, E.C.

Metropolitan Association of Electric Tramway Managers.—At a meeting of the members of the above Association held on Friday last, Mr. Blain was re-elected chairman, and Mr. Goodyer honorary secretary. A communication from Sir E. R. Henry, Commissioner of Police, was read with regard to various metropolitan public carriage licensing matters. The hon. secretary was directed to send a reply thereto. The chairman reported the result of an interview which the hon. secretary and himself recently had with several of the metropolitan Members of Parliament at the House of Commons, regarding licensing matters. A discussion ensued, and it was ultimately agreed to furnish the various Members of Parliament with the information they specially asked for.

Birthday Honours.—A knighthood has been conferred upon Prof. J. J. Thomson, F.R.S., president-elect of the British Association, and Cavendish Professor of Experimental Physics, Cambridge. It is also interesting to note that Mr. Luke White, the Chairman of the House of Commons Committee now dealing with the London Electric Power Bills, has had the honour of knighthood conferred upon him. Sir Charles McLaren, Chairman of the Metropolitan Railway Co., has been made a Privy Councillor.

BRITISH-MADE PORCELAIN INSULATORS

AMONG their exhibits at the Manchester Electrical Exhibition, Messrs. Bullers, Ltd., showed a fine collection of all kinds of porcelain articles for electrical purposes. An interesting feature of their exhibit was that they have high-tension insulators under test at very high pressures. They fitted up an arrangement so that the insulator could be shown tested under a shower of water to show its behaviour under the severest rains. Our representative saw three 10,000-volt insulators of different design under test. The first one, shown in the illustration marked No. 1, actually flashed over at 72,000 volts, which dried



Scale: One-sixth Full Size.

PORCELAIN INSULATORS.

it so that when switched on again it stood this pressure for a considerable period. When water was turned on to such an extent as to represent more than the severest of tropical thunderstorms, it only broke down at 50,000 volts. This insulator was designed for use in Mauritius, and No. 2 is an alternate design got out by Messrs. Bullers themselves, of a slightly cheaper construction, but equally efficient. The third type illustrated has a sleeve over the bolt. Although there is surface leakage over the inner end of this sleeve, it is found that the addition increases considerably the voltage that the insulator will withstand without flashing over, as the spark cannot travel right across from the inner petticoat to the belt, but has to go round the indirect path. This insulator took 72,000 volts when tried without flashing over, and when under a shower of water broke down at 64,000 volts.

Wireless Telegraphy.—The wireless telegraph station in the North Basin of the Buenos Aires Docks has been opened to public service. There are other stations at Rio Santiago, Recalada Ponton, and Rada lighthouse. Messages can be transmitted within a radius of from 500 to 800 kilometres. A De Forest wireless telegraph station has been erected at Colon (Panama), and is under the control of the United States Navy Department. Under favourable atmospheric conditions, communication is said to have been made with Guantanamo, Cuba.

Electricity in the Timber Industry.—In a Paper read before the Electrical Association of New South Wales, an attempt to apply electric power to the hauling of logs from the bush to a sawmill was described. A small generating plant was installed on a creek, and power was distributed within a radius of three miles. The logs were hauled along with wire ropes by means of a portable winding gear. As the routes had to be surveyed and broken up into a number of practically straight runs with sheaves at each change of direction, the expenses connected with the work were found to be very heavy, and finally, owing to shortage of funds, the scheme was abandoned.

Telegraph Traffic.—The submarine cable between Kotonon and Grand Bassaon failed on October 29th; telegrams for the Ivory Coast are being forwarded by the best means. The El Arich route between Adana and Beyreuth and between Alep and Beyreuth became interrupted on the 9th inst., and on the same day the cable between Zanzibar and Mombassa ceased working. Communication between Pontianak and Saigon is still interrupted. There is reason to believe that an understanding has been arrived at regarding the reopening of the Port Arthur-Chefu cables, which have been closed since March 9th, 1904, the time of the Russian-Japanese War. The El Arich route was again restored on November 10th, 1908.

LONDON ELECTRIC POWER BILLS

Proceedings before House of Commons Committee

CONSIDERABLE progress has been made with the opposition against the London and District Electricity Supply Bill since our last issue, the cases for the majority of the municipalities who have petitioned against the Bill having been heard and good headway made with the company opposition. The Board of Trade report on the Bill has not yet come under discussion.

Our report last week completed the case for the promoters of the Bill. The opposition has crystallised into a number of classes, all more or less distinct in their interests in relation to such a scheme as this. In all there are thirty-eight petitions against the Bill, of which only nineteen are supported by the appearance of counsel, and it may be mentioned that there are something like 55 authorised distributors in the area scheduled in the Bill. The present opponents may be classified as follows: borough councils, with such special cases as Marylebone and Westminster; the companies who are appearing in two bodies owing to the disagreement which led to the deposit of the two Bills by the East End and West End companies respectively, which will come before the Committee later; the City of London Corporation, counsel for which always argue a special importance, unappreciated, in effect, by Committees generally and distinctly so by Lord Cromer's Committee when it dealt with these Bills; the Middlesex County Council, in whose area there is already a power company; and finally, the superfluous opposition of a Mr. W. Gentry Bingham, who is presumably an unauthorised representative of the general public with an excess of spare time and a scheme for the creation of an authority on the lines of the Water Board for dealing with the question in conjunction with the traffic problem. The absence of any railway, water, and similar companies is explained by the presence of clauses in the Bill for their protection.

The borough councils and local authorities who have placed their cases before the Committee are: Marylebone, Battersea, Croydon, Woolwich, West Ham, St. Pancras, Shoreditch, Southwark, Hornsey, Finchley, Chiswick, Bexley, Beckenham, Stepney, and Hammersmith. Evidence was called on behalf of each as to origin and progress of their undertakings, and estimates were given showing the price at which the present authorised distributors will be able to supply by the time the power company gets into working order. In every instance these worked out to the advantage of the distributor; it was also shown that by reason of the existence of the necessary buildings, new generating plant can be installed at a less capital cost than that given in the promoters' estimates. All this evidence, however, is a replica of that given before Lord Cromer's Committee in May and June, and the details need not be repeated. A feature of the evidence was the production of tables to counteract those handed in by the promoters, but as in most cases they were based upon different assumptions, or there was some little detail which rendered direct comparison between the two impossible, the result was always confusing, or, at any rate, there was a confusion of ideas as between the witness and the cross-examining counsel, which served no useful purpose. Some reference may, however, be made to the general effect of the speeches, and to some hints by the Chairman as to the lines upon which the Committee intend to deal with the problem, assuming the preamble of the Bill is passed. In the first place it is to be regretted that counsel for the opponents have not yet realised, in spite of it being repeatedly pointed out to them, the futility of the contradictory argument that on the one hand, the passing of the Bill will set up unfair competition, and on the other that the authorised distributors can supply at cheaper rates than those proposed. One after another have the opposing counsel got up and placed this argument before the Committee, only to be asked by the chairman how could the Bill create unfair competition, or, indeed, any competition at all, if the authorities are able to supply at cheaper rates. The answers, for the most part, have been an evasion of the question, and counsel seemed relieved that the point should be allowed to drop. One new point, however, is that the local authorities, who, through their representatives, seem almost to take it for granted that the Bill will be passed in some form or other, are now asking for an absolute veto against the entry of the power company into their areas. Mr. Vesey Knox, K.C., who appeared for Hornsey, Finchley, Chiswick, Bexley, and Beckenham, was almost alone in attempting to adduce arguments against the scheme which were not repetitions of everything that has been said, and unsuccessfully, before. He argued that a much stronger case was made out in favour of Mr. Merz's Bill of 1905, for he now admitted that a state of affairs then existed with regard to electric supply which was sadly in need of reform, although, by the way, he denied it at the time. During the interval, however, he claimed that much of this had been remedied, and it was not worth while disturbing the present rate of progress by passing the Bill. In common with other counsel, he complained that the fact of these power Bills being before Parliament for several years had tended to retard the normal progress of the existing undertakings, manufacturers preferring to await developments in the hopes of getting a very much cheaper supply in the near future. But even when the company was in full working order, the total saving shown by the promoters' estimates was only ¼d. per unit. The Chairman here suggested that the promoters admitted that some of the stations would not receive so much benefit as others, so that in some cases there would be considerable savings. Mr. Knox agreed, but stated that all this was on the assumption that the promoters' estimates were correct. Mr. Hammond was known to be a most sanguine statistician; in fact, he went so far as to call him the standby of the Parliamentary bar, his hopeful estimates presumably leading to the promotion of many Bills which would otherwise not have been proceeded with.

In answer to those who asked for exclusion from the area, the Chairman stated that the Committee would not take into consideration the cutting out of any central portion of the area, but would deal with the scheme as a whole. There might, however, be exceptional circumstances why certain districts on the borders of the area should be excluded, and these would be the subject of special consideration. Similarly, reference has been made to the clauses regarding supply arranged by Mr. Merz with several authorities, and the absence of them in this Bill, commented upon. On this point the Committee take the view that even if such clauses were produced, they would not sanction them in relation to particular districts. Clauses of this character would be made applicable to every authority in the area. In fact, the chairman's remark made it clear that the Committee does not favour the insertion of such clauses in the Bill, and that it would probably reject them even if produced by agreement between the promoters and the authorised distributor. The Chairman has also rather intimated that the discussion upon the Board of Trade report should be postponed until the clauses are reached, if this is done, as he has limited the remarks of opposing counsel on the purchase clause. With regard to the local authorities, which admittedly are in special circumstances, it may be said that the Westminster City Council does not now oppose, the promoters having agreed to safeguard the City Council's rights of purchase. The Westminster City Council is more favourably situated than many councils, for, in addition to being able to purchase the greater portions of two or three companies which supply their area, they have the right to purchase the generating station of the Central Electric Co., which is outside. The special circumstances surrounding the Marylebone undertaking have also been placed before the Committee, whilst the promoters have not failed to impress upon the Committee, in cross-examination, the enormous loss upon the Woolwich undertaking, which has entailed a rate of no less than 8d. in the £. Attention has also been called to the possibility of the power company conspiring with the existing companies to so mix up affairs that it would be doubtful what the local authority would purchase.

On Friday, the opposition of the eight companies who are promoting the London Electric Supply Bill was opened by Mr. Balfour Browne, K.C., who appeared to be in his most belligerent mood toward his legal brethren representing the promoters. He rested the major portion of his case upon unfair competition, calling attention to the fact that the competition now existing was between companies working under the Electric Lighting Acts, and subject to all their restrictions. The now familiar heap of canvassers' reports of the County of London Electric Supply Co. were again produced as testifying to the "push" which is exercised by the company, and we were given to understand that the same applies to all the companies represented by Mr. Balfour Browne. Evidence on this head was given by Mr. H. B. Renwick, of the County Company, and by Mr. A. F. Harrison, of the City Company. The companies have carried out a canvass in order to arrive at the horse-power of machinery in the County of London not driven electrically, as a test of the accuracy of Mr. Merz's figure of some 500,000 h.p. The canvass of the companies gave a result considerably less, and in comparing it with the figures given by the present promoters Mr. Balfour Browne gave as the total for the whole area, the actual total for the County of London. This led to an interruption by Mr. Fitzgerald, with the result that no fewer than four different figures were being repeated in a cross conversation between counsel, and it is doubtful whether the Committee, in the end, were clear as to who was responsible for any of the totals in question. One of the Committee later asked a question concerning the competition in the City between the City Co. and the Charing Cross Co., and was told there was an agreement between the two not to quote below an agreed minimum price. A point in the evidence of Mr. C. P. Sparks, who followed,

Digitized by Google

was that he disagreed with the railway witnesses for the promoters, and asserted that the supply to railways was of such a special character that the railway companies would decide to erect their own generating stations for the sake of the greater reliability, or, at any rate, any supply company would be compelled by the railway company to erect special plant for the purpose.

The Committee did not sit on Monday, but on Tuesday Mr. Sparks continued his evidence, and was followed by Mr. J. S. Highfield, the Chief Engineer to the Metropolitan Electric Supply Co. The effect of this evidence was that, from an intimate knowledge of the conditions prevailing in the area scheduled by the Bill, it would be commercially impossible to work such a bulk supply undertaking. Bulk supply in itself would be impossible for the reason that authorised distributors would not agree to deal with the company, knowing that it had powers to compete for their individual consumers, so that either the powers of competition would have to go, or they would be destructive to the scheme. It was stated that there is installed in the present generating stations in the area 83,000 kilowatts of plant not actually in use, and it was computed that during the next five years there might be a gradual increase of the present demands of a further 25,000 kw. Thus there was no need for a new power station. Mr. Highfield said that, speaking from actual experience, he had found that the actual saving from the use of metal filament lamps was 33 per cent., against the theoretical saving of 70 per cent. Neither Mr. Sparks nor Mr. Highfield found fault with the scheme from an engineering point of view, in this respect it was on the most up-to-date lines, and would be an ideal proposal if no supply was at present being given. The opinion was expressed, however, that in order to make the scheme a successful one, a large proportion of the existing undertakers would have to be ruined and the power company undertake a large distribution business. At the same time it was pointed out that the estimates put before the Committee by the promoters included a very inadequate amount for distribution purposes, another argument in favour of the existing companies' contention that the whole proposition is ill-conceived. On the question of the railway load, Mr. Highfield emphatically supported Mr. Sparks that it would be necessary for the plant, to deal with this, to be entirely independent of the ordinary load. Although a good deal of reference has been made to the North-Eastern Railway, it was pointed out to the Committee that this only represented a load of 4,000 kw., whereas, if the promoters' estimates were right, the railway load in London would amount to 25,000 kw. Both witnesses regarded "linking up" as a perfectly sound solution of the question to be dealt with in London, owing to the very large amount of spare plant not now in constant use and the facilities for extensions at extremely low cost. Although the Willesden station of the Metropolitan Electric Supply Co. is run practically as two stations in order to avoid inconvenience from breakdown, Mr. Highfield asserted that no amount of subdivision of the generating plant could guarantee immunity from breakdown, as, for example, a boiler explosion would be bound to affect the whole of the buildings. Some stress was laid upon the possibility of the use of gas engines and oil engines of large size in the near future, which it was contended would upset the whole of the promoters' estimates.

Mr. J. D. Fitzgerald, K.C., in his cross-examination, made a good deal of the fact that although the Metropolitan Co. held bulk supply powers over a very large area, only one supply of this character was being given, namely, to Acton, and that at a very high figure. The reply was that this only demonstrated the difficulties of bulk supply, and strengthened the case for the opposition to the Bill, but Mr. Fitzgerald preferred to have it that the price was the determining factor. The Metropolitan Co., however, for instance, after a careful consideration, had come to the conclusion that it would be a bad business policy to lay trunk mains everywhere in the hope that business would come along. They are therefore adopting the plan of endeavouring to secure distributing powers in addition to bulk supply powers, and are making arrangements to take over Provisional Orders. In a long argument as to the benefit which the gas mantle has conferred upon the gas industry, Mr. Highfield refused to admit that this was so. He said it was one cause of the improvement in the demand for gas recently, but there had also been a great development in cooking and heating by gas, and he maintained the view that for some years at any rate there was not likely to be a great increase of revenue from lighting due to the use of metal filament lamps. In many areas, he said, there was likely to be a permanent decrease owing to the fact that there was little, if any, room for expansion. Mr. Fitzgerald took the opportunity of making it clear in his cross-examination that the saving which it was estimated the existing authorities would make by taking a supply in bulk from the power company had been arrived at after allowing for a reasonable reduction in the existing costs, during the next two or three years, by which time the power company would be in operation. This point had not previously been brought forward, and the opponents themselves seem almost to have overlooked it.

Mr. J. Conacher, General Manager of the Metropolitan Electric Supply Co., was the next witness, and handed in a number of tables showing the commercial position of all the company undertakings in the area. The Chairman, however, requested that the details should not be given in evidence, but placed upon the "notes" for reference in case any figures should be challenged.

It is hoped to complete this Bill, and commence the London Electric Supply Bill, by Tuesday.

The General Committee of the National Liberal Club has passed the following resolution regarding the London and District Electricity Supply Bill:—"This committee is of opinion (1) that the purchase clauses of the London and District Electricity Bill now before Parliament should be amended so that the undertaking may be acquired by the central local authority within twenty years upon equitable terms, such terms not to include anything for goodwill or prospective profits. (2) That such necessary alterations or additions be made to the Bill as will prevent the purchase, amalgamation, or creation of agreements contrary to the interests of consumers between the existing electrical undertakings, whether municipal or company, and the new company. (3) That a Bill should be introduced by the Government making the central local authority the purchasing authority for all existing electrical undertakings, whether municipal or company, in the area covered by this Bill within the same period of twenty years."

CATALOGUES AND PAMPHLETS RECEIVED

GEARING.—A collection of leaflets from the "Buffoline" Noiseless Gear Co., Ltd., of Levenshulme, Manchester, call attention to their high-class gearing made both in metal and their own special "buffoline" leather and ordinary raw hide. These buffoline pinions are particularly suitable for electrical driving, and are made from buffalo hide treated so as to withstand the effects of oil.

RADIATORS.—A new list issued by Messrs. Falk, Stadelmann & Co., Ltd., of 83-87 Farringdon Road, London, E.C., describes and illustrates over twenty designs of "Aureola" electric radiators. These are all of the luminous or glow-lamp pattern, and are fitted with either two or four lamps, consuming 250 watts each. The designs illustrated include portable radiators for standing in any position in a room, and radiators for placing in the fireplace.

SCREW CUTTING LATHE.—A leaflet from John W. Perkin, of Lord Street Works, Leeds, describes an improved pattern of 3½ in. centre, sliding, screw-cutting, and boring lathe. Great rigidity and accuracy are claimed for this design of lathe. The leading features are the swiveling back-geared headstock, the position of the leading screw, and the method of casting bed and tray in one piece.

SWITCHGEAR.—Three new pamphlets have been issued by Messrs. Reyrolle & Co., of Hebburn-on-Tyne, relating to their special systems of high-tension switchgear. One of these describes in detail the highly original and well-thought-out system of ironclad switchgear which they have developed, and which was described and illustrated in ELECTRICAL ENGINEERING, July 2nd, page 24. Another is devoted to the Merz-Price protective system employed in connection with this gear to a large extent on the large power-distribution systems in the north (see ELECTRICAL ENGINEERING, Vol. III., page 763), and the third points out the advantages of this kind of switchgear for mining work, and goes into the general requirements of colliery work in the way of switchgear, with descriptions and illustrations of various forms of apparatus particularly designed for mining work.

"The Central."—The current number of this publication, the magazine of the Central Technical College, Old Students' Association, contains several interesting and well-illustrated articles on engineering subjects, including a description of the method of construction of a main sewer for the City of London and some notes on the chemistry of fuels and their calorific value. Other articles deal with water rheostats for the artificial loading of large high-voltage generators, and a little known form of belt-gearing of French origin. Dr. C. V. Drysdale contributes an article on recent developments in light production, in which some recent tests on the quartz mercury vapour lamp are described. To those who have at any time been connected with the College, the most interesting reading in the magazine is, without doubt, the "Old Student Notes," which feature, we are pleased to see, has increased in length. A photograph of a group of the secretaries, captains, &c., of the various social and athletic clubs of the College is contained in the magazine, and a few of the recently published engineering works are reviewed. A list giving the ages and requirements of several old students who want change of employment has been drawn up by the Old Students' Association Employment Agency, and sent round in the form of a leaflet with the magazine.

SUMMARY

REDUCTIONS are notified in the price of Osram and Sun Tantalum lamps. (Page 664.)

THE Highways Committee of the London County Council, in a report upon the G.B. surface contact system on the Aldgate to Bow tramways, recommend, in accordance with the report of Mr. W. M. MORDEY, that half a mile of the track should be overhauled and the studs modified in accordance with drawings prepared by Mr. MORDEY, who expresses the opinion that this, together with certain other modifications, will result in making the working of the system practicable. The cost of this is estimated at £500, which the "G.B." Surface Contact Co. will bear in the first instance, but the Council will refund the amount should the Board of Trade sanction the reconstructed line. The experiment will consist of running one or two cars over the length of line in question at night, especially under trying conditions of weather and track. Certain experiments are also recommended by Mr. MORDEY with the contact-brushes and collector. Unfortunately Mr. Mordey's full report has not been made public. The recommendation has been adopted. (Page 665.)

THE following books are reviewed in this issue:—"The Principles of Alternating Current," by E. T. Larner; "Logarithms for Beginners," by C. N. Pickworth; and "Fowler's Mechanics' and Machinists' Pocket Book and Diary for 1909." (Page 665.)

THE method adopted in Berlin for the control of the street arc-lighting from the generating stations is described. With this system it is possible to control any number of arc lamps of equal burning life and connected to the same point on the mains, by means of a single control conductor between the main switch-pillar at the point of connection and the central station control-board. (Page 666.)

IN his address as Chairman of the Newcastle Local Section, Mr. A. L. E. DRUMMOND gave a general review of recent progress in the electrical industry, and made special reference to the increase in the limit of capacity for a given speed of electrical machinery. (Page 666.)

AT the meeting of the Institution of Electrical Engineers on Thursday last, tributes were paid by Mr. W. M. MORDEY and Prof. JOHN PERRY to the memory of the late Prof. AYRTON, and a resolution of condolence to Mrs. AYRTON and the other members of the family was passed by the meeting. (Page 667.)

AN address delivered by Mr. G. F. PILDITCH as Chairman of the Dublin Local Section of the Institution of Electrical Engineers, dealt chiefly with the question of electric supply in residential districts. The author considered such matters as the prospect of improving the load factor, and of reducing the cost

Digitized by Google

of services. Publicity matters and methods of charging were also dealt with. (Page 668.)

THE Oxford Corporation has refused to vary the terms of the original agreement with the National Electric Construction Co., for the contruction of electric tramways in that city. This agreement provides for the installation of the Dolter surface-contact system, or some other similar system, to the satisfaction of the Corporation, and for the payment of an annual rent. The company wished to be relieved of using a surface-contact system, and to instal a combined conduit and overhead system, and they further asked for a reduction in the rent payable to the Corporation. (Page 668.)

THE works of Messrs. Clarke Chapman & Co., at Gateshead, is interesting as an example of a works originally driven by steam, where the opportunities of cheap electric power supply are now taken full advantage of, as well as on account of the electrical and other engineering work carried on there, especially in the direction of the applications of electricity to marine purposes. (Page 669.)

A FRICTION-DRIVE device applicable for attachment to small high-speed motors to enable these to be used with large slow-speed ventilating fans is described. A total efficiency equal to that of a slow-speed motor fan is claimed. (Page 670.)

A 6,500-kw. 12,000-volt three-phase generator which has been installed at Niagara was described by Mr. B. A. BEHREND in a paper read before the American Institute of Electrical Engineers at their summer meeting this year. The mechanical construction of the rotor is dealt with at length in the Paper, and we reproduce a complete section drawing and several curves showing the performance of the machine, which were included in the Paper. (Page 671.)

SOME particulars of low voltage lighting installations carried out at Cambridge are described. Double-wound transformers and concentric wiring with uninsulated return were employed. (Page 672.)

IN a Paper read before the Birmingham Local Section of the Institution of Electrical Engineers, Mr. S. P. SMITH drew attention to the sources of failure and incorrectness of the method of testing alternators on short-circuit due to BEHREND, and modifications of that method, and then described an improved method by which the actual full-load conditions can be exactly imitated by supplying the total losses and the temperature rise and efficiency accurately obtained. In this method all the poles are fully excited, but they are grouped into "motor" and "generator" poles. The necessary difference between "generator" and "motor" voltages is obtained by having nearly twice as many "generator" poles as "motor" poles. In the discussion which followed the Paper, Dr. W. E. SUMPNER pointed out that the method described was not new; Mr. R. A. CHATTOCK doubted whether the results of such a test would be accepted by consulting engineers and others; Mr. EVEREST spoke in favour of the method in which the losses are obtained separately by no-load and short-circuit tests; and Dr. M. KLOSS suggested that the method described by the author should be adopted as the standard method by the Institution of Electrical Engineers. Mr. SMITH'S reply was postponed to the next meeting. (Page 673.)

AMONG the specifications published on Thursday last by the Patent Office is one by E. R. GROTE and THE FOSTER ARC LAMP AND ENGINEERING CO., LTD., in which a form of carbon electrode for flame arc lamps, with two or more hard cores, is described. A specification by G. BERRY relates to a modification of the well-known "Berry" series transformer distribution system, and another by the BRITISH THOMSON-HOUSTON CO., LTD., covers a method of constructing rotors for induction motors, whereby the advantages of open slots are obtained without the attendant disadvantages. Details in processes for manufacturing metal filaments are dealt with in specifications by H. ARON & A. GEIGER and W. D. COOLIDGE respectively, and P. GRAETZER has patented a further development of the cable and wire connector described in last week's issue. A patent taken out by SIEMENS BROTHERS DYNAMO WORKS, LTD., and E. O. KIEFFER covers a method of construction for commutators for high-speed machines, by which efficient cooling of the commutator is obtained. Short abstracts of the above are given in our Patent Record. Among the expiring patents is one by F. N. CONNET and W. W. JACKSON relating to meter mechanism, and another by R. T. and J. G. GLOVER for a prepayment meter. (Page 675.)

THE Bill embodying the proposals for a general tax on electricity and gas in Germany has now been drafted, and we publish this week a summary of the Bill and of the official explanatory memorandum. The taxation of not only electrical energy and gas, but also lamps and burners, is proposed. Electricity for power and heating, as well as that for illuminating purposes, is to be subject to the tax, whether used privately or sold to the public. The probable total revenue from the tax has been estimated at £2,500,000. (Page 677.)

THE case against the London and District Electricity Supply Bill was concluded on Tuesday morning, and the reply of counsel for the promoters was commenced at once. This reply on the part of the Hon. J. D. Fitzgerald was still being delivered when we went to press. The Parliamentary Committee of the London County Council have issued a report dealing with the Bills in which protest is made against the clause in the Board of Trade report upon these measures, which refers to the purchase of the undertaking of the London and District Electricity Supply Bill. The Parliamentary Committee of the London County Council state that in view of the instructions by the House of Commons to Sir Luke White's Committee, relating to the other two Bills, which give rise to questions of considerable importance, they are giving the whole matter their careful consideration. Counsel has been retained by the London County Council to discuss the Board of Trade's report with the Committee when it comes up for consideration. (Page 678.)

THE Prime Minister has agreed to receive a deputation from the London County Council on the question of the establishment of a London Traffic Board on November 26th.—The Paddington Borough Council has refused to consent to the construction of tramways from Harrow Road to Maida Vale.—In connection with the construction of tramways in the Eltham district, the Astronomer Royal has objected to the use of overhead wires owing to the possibility of interference with the instruments at the Greenwich Observatory.—The Rhyl Council have approved of the light railway scheme proposed by the Llandudno and District Tramways Co.—Agreements have been sealed between the Grimsby Corporation and the Admiralty for a supply to the wireless telegraph station at Humberstone.—The Tynemouth Corporation have retained Messrs. Handcock and Dykes to report upon the electric lighting undertaking.—Telegraph wires in Aberdeen have been transferred underground in about 200 thoroughfares.—A number of 50 c.p. Nernst street lamps in Barnes are to be changed to 100 c.p. Osram lamps. (Page 679.)

THE Auckland (N.Z.) Council propose spending £4,800 in additional consumers' services. Cable to the value of £300 is required at Clacton. A loan of £150,000 is to be applied for by the Glasgow Corporation for the purposes of the electricity undertaking.—The Yarmouth Corporation are applying for a loan of £2,000 for public lighting.—Local Government Board inquiries have been held at Hounslow, £7,088, and Wolverhampton, £6,000. A loan of £4,900 has been sanctioned to the Surbiton Council by the Local Government Board.—Tramcar trucks and tramcar resistances are required by the Manchester Corporation. (Page 681.)

Digitized by Google

THE Anchor Cable Co. are inviting subscriptions to an issue of £50,000 4½ per cent. debenture stock at 125.—The Lancashire Power Constrution Co. are creating debenture stock to the extent of £150,000. (Page 683.)

SOME notes are given on the reconstruction of the San Francisco tramway system after the earthquake and fire of 1905, including the conversion to the overhead trolley system of most of the lines formerly worked by electric traction. (Page 683.)

A LETTER received from Mr. K. FAYE-HANSEN, of the British Westinghouse Company, criticises the views expressed in Mr. A. H. DYKES'S recent article as to the relative advantages of balancer-, auto-, and double-winding transformers for low-voltage lighting installations, and finds fault with some of his figures. (Page 664.)

THE London Electrobus Co. have issued a statement with regard to the working for the period from July 15th, 1907, when their 'buses were first placed upon the streets, until October 15th of this year. This shows that the average takings of the 'buses have been 14d. per 'bus mile. The total number of passengers carried to date on the company's 'buses was nearly 3,000,000, and the statement referred to includes some figures comparing the results of the company with those of the London General Omnibus Co. and the London County Council tramways. During the first twelve months of the company's operation the earnings only exceeded the operating expenses by £743, which was not sufficient to meet establishment and other expenses of the company. For the last three months, however, the earnings have exceeded the operating expenses by £1,526. (Page 685.)

THE first of the four American three-phase locomotives which are to be used on the system of the Great Northern Railroad in the Cataract Tunnel has been delivered. It is driven by four slip-ring induction motors, with rotor rheostatic control. Current will be obtained from a water-power station, and the water-wheels will be allowed to slow down and lower the frequency on heavy load to assist in the starting of the locomotives. (Page 685.)

THE first annual report of the Special Traffic branch of the Board of Trade, which was constituted last year, has been issued by Sir Herbert Jekyll, who has charge of this Department. The report is intended as a supplement to the report of the Royal Commission on London Traffic, and deals with the progress that has been made since the latter was published. The formation of a special Traffic Board is favourably commented upon, and a scheme of amalgamation and co-ordination of the existing locomotion facilities in London and Greater London is strongly advocated. (Page 686.)

MR. MORDEY'S report to the L.C.C. on the "G.B." system is favourable to a further trial, after modifications have been made in the construction of the studs and the collectors, with the apparent aim of reducing leakage and surface sparking. Unfortunately only the recommendations in Mr. Mordey's report have been made public, but we publish this week all the information that is available. The technical details have been suppressed for the present, but we gather that he thinks that the magnetic permeability of the stud head is deficient, and may be improved by the substitution of steel of better magnetic quality than the iron at present in use. It appears that the object to be gained by this is better contact with the collector (which, it will be remembered, is a flexible chain magnetically attracted into contact with the stud surface), and thereby a diminution of the visible sparking which has been much complained of. The change will not make a proportionate difference in the actual working of the switch movement itself, because by far the greater portion of the path of the effective magnetic flux is in air, or its magnetic equivalent, paving, concrete, and subsoil; but any small improvement in the permeability of that path is to the good, not only for the more certain switching "on," but for more certain switching "off." The other suggested alteration published is in the insulation of the collector, in which the wooden coverings, and hemp suspension ropes are to be made impervious to moisture by soaking in paraffin wax, or something analogous. We can only express the hope that this soaking will have the good effect that is anticipated. It is very likely that the condensation of the report does Mr. Mordey an injustice, and is the reason for the absence of any specific recommendation to remedy the heavy surface leakage from the studs which has been alleged. The reticence with regard to the details of Mr. Mordey's experiment and report is quite comprehensible in view of the political situation on the L.C.C. and the commercial interests at stake, as well as the possibility of the report containing technical criticisms of that part of the work due to the permanent officials of the Council; but as the document in question is a report from an impartial expert of the highest ability and reputation, it is surely time to make public the technical facts, and the results of the tests which so experienced an investigator has made. In tramway circles very divergent stories are afloat as to what actually happened in the Mile End Road, and for the general information of the industry the truth should be made known. Those who have studied the subject are curious to ascertain whether it is possible to make a surface-contact system work efficiently in London; a good trial is to be given to a system which has already passed satisfactory working tests in a provincial town, and it is desirable, in the interests of progress, to know what actual difficulties have been met with under the more exacting conditions of London traffic. We are glad that, as a result of Tuesday night's debate in the Council, a further trial will be given, and we trust that a sensible advance towards good and safe working will result therefrom.

THE Royal Commission on London Traffic recommended the creation of a special permanent Board to deal with the whole subject of London public transport by methods of oversight and control with considerable executive powers. Although no such body has yet been formed and invested with the necessary authority, the Board of Trade appointed a special department to watch the conditions and to record the changes which come about. The effect is to continue and keep up to date the work of the Royal Commission, and as it must be supposed that the work is intended to serve a useful purpose, the inference is that the Government recognises that sooner or later authority must be given to someone to carry out the functions suggested by the Royal Commission, and that it will help a good deal to maintain the record. Otherwise the Traffic Authority may easily spend its early years in revising the Royal Commission's statistics. The first report of the London Traffic Department appears to follow these lines, as it reads very much like an additional volume of the Commission's report, chronicling the changes of the last three years, and drawing such inferences from the statistics as may indicate desirable future developments. The changes

Digitized by Google

recorded are very important. Twenty-six miles of new tube railways have been opened. Sixty-eight miles of steam railways have been electrified. An additional twenty-six miles of tramways have been electrified by the London County Council. Eighty miles of new electric tramways have been provided in outer London. Over a thousand motor-omnibuses and a large number of motor-cabs have been introduced in London. Kingsway, Aldwych, the new Vauxhall Bridge, and the Rotherhithe Tunnel have been opened. The South London tramways have crossed the river at Vauxhall and Westminster, and now join up to the North London system *via* the subway. The yearly journeys per head in Greater London have increased from 200 in 1901 to 300 in 1907. It is clear, as the best traffic experts have always maintained, that in London travelling is mainly a matter of facilities. The report alludes to the financial results of the tubes, and of the electrified underground railways, as disappointing. This is somewhat premature. The time has not yet come at which the traffics are stationary, and at which the best possible arrangements as to fares and services can be said to be attained. On the contrary, the traffic returns show pretty general increases, and frequent changes in services, and increase of through booking and other facilities, show that the companies are not yet satisfied that they are making the best of their undertakings. Finally, the most potent contribution to traffic on these lines comes from new habits and shifting of population, which take time to bring about. The tramway development is reported on much more favourably. The good progress made is an argument for extending tramway benefits throughout London, and it cannot be long before such neglected districts as Kensington and Bayswater, not to mention the sacred City, will realise that the tramway is a boon to be invited, not an evil to be repelled. The facilities given by the City Corporation in respect to the crossing of Blackfriars Bridge, and the extension of the northern lines to Liverpool Street, are proof that this knowledge is penetrating in quarters which have hitherto only appreciated the drawbacks of tramways. Such "peaceful penetration" is the most satisfactory, but wofully slow. It is most unfortunate for London that municipal and even Imperial politics have made the London Traffic Board a question of party warfare, and it is most fervently to be hoped that the present Government will deal with the subject in a broad-minded and business-like way, considering only what is needed for the greater good of Greater London.

REDUCTION IN THE PRICE OF OSRAM AND TANTALUM LAMPS

THE large demand for Osram lamps have enabled the manufacturers to introduce several economies in their manufacture, with the result that from Monday last considerable revisions have been made in the list prices, which are now as follows :—

100–135 volt 28 and 35 watt	3s. 6d. each.
100–135 volt 55 watt	3s. 9d. each.
200–260 volt 50–65 watt	4s. 9d. each.
25 volt pear-shaped 10–16 watt ...	2s. 6d. each.
50 and 55 volt	3s. 0d. each.

All other existing terms and conditions of sale continue in force.

Similarly, the makers of the Tantalum lamp notify reductions in the price from 3s. 6d. to 3s. for the following :—65–75 and 100–160 volts, 32 c.p., ordinary spherical bulb Tantalum lamps, and 100–160 volt, 50 c.p. sun Tantalum lamps, both bell and spherical shape bulbs.

G.B. SURFACE CONTACT SYSTEM IN LONDON

Further Experiments to be Made

AT the meeting of the London County Council on Tuesday, the report of the Highways Committee (given on the opposite page), recommending further experiments in connection with the G.B. surface contact system in the Mile End Road, was agreed to after some discussion.

Sir JOHN BENN moved the following amendment to the Committee's report :—"In view of the failure of the stud system of tramways on the Aldgate to Bow Road, the grave state of revenue to date, and the continued public inconvenience, the recommendation be referred back to the Committee, as the Council is of opinion that the conduit system of electric traction should be installed forthwith." The speaker stated that he was fortified in this view by the fact that the Council's tramways officers did not think Mr. Mordey's suggested alteration could be carried out at the cost which that gentleman had estimated.

Mr. H. H. GORDON seconded the amendment in a long and highly technical speech, in which he contended that the G.B. system was quite unsuitable for engineering reasons.

Sir GEORGE TAUBMAN GOLDIE compared Mr. Gordon's speech to a Paper before the Institution of Civil Engineers, and considered its effect was rather lost upon a Council not composed of electrical experts. He said that the Council, having engaged a leading engineer to report on the matter, must follow his guidance. In supporting the Committee's recommendation, moreover, he rather thought Sir John Benn had entirely overlooked the enormous difficulty of installing the conduit system on the road in question.

Captain HEMPHILL regretted that the Chairman of the Highways Committee had not taken up a fighting attitude towards the Stepney Borough Council, who had stood in the way of more than one Highways Committee in refusing to give its consent to the overhead system.

After some further discussion, the amendment was rejected by a majority of 18, and the Committee's recommendation was adopted.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 19TH.

Royal Society.

4.30 p.m. Meeting at Burlington House, Piccadilly, London. Among the Papers down for reading are the following :—(1) "Note on Horizontal Receivers and Transmitters in Wireless Telegraphy," by Prof. H. M. Macdonald, F.R.S.; (2) "Note on the Effect of Hydrogen on the Discharge of Negative Electricity from Hot Platinum," by Prof. H. A. Wilson, F.R.S.

Institution of Electrical Engineers.

8 p.m. Extra meeting at 25 Great George Street, Westminster. Col. R. E. Crompton, C.B., the retiring President, will distribute the premiums awarded for Papers read during the session 1907–8. Mr. W. M. Mordey will then deliver his Presidential Address, and afterwards hold a reception in the library.

FRIDAY, NOVEMBER 20TH.

North-East Coast Institution of Engineers and Shipbuilders.

7.30 p.m. Meeting at the Sunderland Literary Society, Fawcett Street, Sunderland. Paper to be read :—"The Electrical Equipment of Cranes," by J. Brentnall Duckett.

TUESDAY, NOVEMBER 24TH.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. Meeting at the Municipal Technical School, Whitworth Street. Paper to be read :—"Central Station Design," by J. H. Baxter.

WEDNESDAY, NOVEMBER 25TH.

Institution of Electrical Engineers: Newcastle Local Section.

7.15 p.m. Annual Dinner at the rooms of Messrs. Tilley & Co., Blackett Street.

Institution of Electrical Engineers: Leeds Local Section.

7.15 p.m. Meeting at the University. Paper to be read :—"Comparison of Natural and Induced Draught Systems," by W. N. Y. King.

THURSDAY, NOVEMBER 26TH.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster. Paper to be read :—"Domestic Electric Supply (including Heating and Cooking) as Affected by Tariffs," by W. R. Cooper.

FRIDAY, NOVEMBER 27TH.

Electro-Harmonic Society.

8 p.m. Concert (Ladies' Night) at King's Hall, Holborn Restaurant.

THE "G.B." SURFACE-CONTACT SYSTEM IN THE MILE END ROAD

THE Highways Committee of the London County Council have now reported on the working of the "G.B." surface-contact system upon the Aldgate to Bow tramways. It will be remembered that these lines were opened for traffic in June, 1908, but on July 28th–29th, 1908, the Highways Committee reported that the results obtained from the working of the system as it then existed were such as to show that it would not be practicable to continue the use of the system consistently with the safety of the public using the roads and the efficient working of the tramways, and that arrangements had been made, therefore, for the electric cars to be withdrawn temporarily. In the circumstances, the Council decided to obtain expert advice to enable it to determine whether it would be practicable, consistently with public safety, to render the system safe and efficient. Mr. W. M. Mordey, as the result of very full investigation of the whole matter, has reported that in his opinion all the defects which have shown themselves in the working of the "G.B." system on the Aldgate to Bow tramways are remediable, and that the working of the lines may be made efficient and safe. Mr. Mordey suggests that to demonstrate the practicability of giving effect to his suggestions the following course should be adopted :—(1) A length of not less than half a mile of the track should be overhauled and the studs modified. (The modifications are fully described in Mr. Mordey's report.) All studs should be tested to a definite standard of working, electrically and mechanically, before being put back on the track. (2) One or two cars should be run over this length of track at night, especially under trying conditions of weather and track. (3) Each car should be fitted with extra contact brushes, connected alternatively to a resistance shunt and to a condenser in order to try both methods. The presence of live studs should be insured by adding to the mud on the road at a sufficient number of points to enable a thorough trial to be made. (4) The collector should at first be used as it is now, then with two exciting coils only. The wood coverings of the collector should be made impervious to moisture by soaking in hot paraffin wax or other suitable impregnating material. The wire and hemp suspension rope should be treated in the same way. Mr. Mordey does not think it necessary to change the whole of the stud heads for this trial. About 50 cast-steel heads should, however, he states, be put in mainly for finding how much they improve the contact with the collector—by reason of the better magnetic quality of the steel. The time which would be occupied in making the experiment that Mr. Mordey suggests would not exceed a few weeks.

The modifications proposed will not, it is stated, alter the chief features of the system.

The licensors have been furnished with a copy of Mr. Mordey's report, and they have expressed their willingness, if so desired, to adopt the suggestions contained in that report; and they further state that they will be prepared to adapt and work, at their own cost, an experimental length of line, provided the Council allows the equipment and use of not more than four of its cars for the purpose, and undertakes to repay to them the cost incurred in giving effect to the expert's suggestions, if the Board of Trade sanction the use of the system as so modified.

The report continues that in giving effect to this arrangement care will be taken to secure that as far as possible all risks of danger to the public will be avoided by the experimental car being run in the night-time when the traffic in the thoroughfare is slight; and, in selecting the portion of the route to be used for the experiment, regard will be had to the requirements of the present horse-car services on these lines, which will be maintained until permanent electric services along the whole route can be instituted. The total cost of the experiment will be about £500. A supplemental agreement with the necessary parties to give effect to these proposals, and also to clear up certain outstanding matters in respect of work already done under the contract for car equipments, is recommended, and the following are the main heads of such an agreement :—

(1) The licensors at their own cost to make the necessary alterations to about half a mile of track and provide and fix equipments to such number of cars to be provided by the Council, not exceeding four, as may be necessary to enable the licensors to make further experiments at their own cost with the system under the direction and in accordance with the requirements of Mr. Mordey and to his satisfaction. The Council to provide the necessary electric power.

(2) In the event of the Board of Trade issuing its unqualified certificate for the permanent use of the system on the Aldgate to Bow Bridge line the licensors to be repaid the cost of the work, such cost not to include any sum for the services of the licensors, nor any profit on the cost to the licensors of the work or on the labour. Any dispute to be settled by arbitration.

(3) The works and experiments to be completed within a period to be fixed by the agreement. The running experiments to be of such a nature and extent as Mr. Mordey may consider expedient. The times of the experiments to be arranged not to interfere with the running of the horse-car service.

(4) The licensors to indemnify the Council against all claims arising out of the works and experiments.

(5) The chief officers of the Council to be afforded facilities for inspection of works.

(6) A payment of £1,000 on account of materials supplied under the contract for car equipments, dated December 20th, 1907, to be made to the company, and any disagreement as to further payment under that contract to be settled by arbitration. The licensors to use such of the said materials as may be suitable for the further experiments and make an allowance to the Council therefor.

REVIEWS OF BOOKS

The Principles of Alternating Current. By Edgar T. Larner. 132 pp. 7½ by 4¾ in. 68 illustrations. (London : Crosby Lockwood and Son.) 3s. 6d.

THERE are many text-books which, like the present one, aim at giving a clear knowledge of the first principles of alternating-current theory to those who have not had the advantage of a mathematical training, but we do not think that the present author can claim to have produced a work much more lucid than some of those already existing. It is very important that the student who plunges into alternating currents with the severe handicap of a complete lack of knowledge of mathematical methods should, at the very beginning, realise some sort of physical conception of a magnetic field, of the effect of one magnetic field on another, and of the reaction between a current-carrying wire and a magnetic field. Looking at the question from this point of view, we feel inclined to criticise the first figure of the book, which seems to indicate some misconception on the part of the author of what happens when a conductor cuts through a magnetic field. The magnetic lines are shown yielding to the conductor and eventually closing round it. According to the recognised nature of magnetic fields, the lines would not yield to the conductor unless it carried a current. They can be distorted only by the influence of another field, such as that which would be present round the conductor only if it carried a current, but is not shown in the figure. Again, as a line of force always tends to shorten itself, it will not curl round even a current-carrying conductor, and meet at the other side, but will snap across the intruding conductor after a certain amount of yielding. These may seem mere details, but once a reasonable physical conception of such phenomena has been obtained, the student's way is easy, and it is certainly a mistake to bring him up to the idea that magnetic lines of force will yield to a mere piece of metal. The author follows his introduction with the usual rules for the direction of induced currents and a few remarks on units. Mechanical analogies are used to much advantage in explaining the simplest phenomena as well as those which are more difficult to grasp. After dealing briefly with Helmholtz's equation, the first chapter concludes with some notes on the effects of inductance and capacity. In Chapter II. simple harmonic motion is explained, and the graphical representation of quantities by means of vectors is introduced in the next chapter. In Chapter IV. alternating currents are dealt with, and in the following chapters the calculations relating to circuits containing inductance and capacity are explained and illustrated by numerical examples. The book is well arranged, and a large number of exercises, without, however, any answers, are included.

Logarithms for Beginners. By Charles N. Pickworth. Second Edition, 42 pp. 7¼ in. by 5¾ in. (London : Whittaker and Co.) 1s.

IN preparing a second edition of this well-known book on logarithms, the author has taken advantage of the opportunity offered for correcting a few numerical errors; otherwise, the work is unaltered. It is doubtful whether a more practically useful work on logarithms than the one under review exists, and, on account of the concise and lucid manner in which the methods and reasons of the various operations are explained, the book is admirably suited for those students who are obliged to teach themselves. A judicious use of italics and heavy type and careful arrangement in chapters and paragraphs, have considerably added to the value of the work.

Fowler's Mechanics' and Machinists' Pocket Book and Diary, 1909. Edited by W. H. Fowler. 448 pp. 3¾ in. by 6 in. (Manchester: Scientific Publishing Co.) 6d.

ALTHOUGH this new pocket book has been brought out primarily for the use of fitters, turners, foundry-men and apprentices, it will be welcomed by many other classes of workers. The sections include a large and up-to-date collection of rules, references, and tables, the elementary principles of mensuration, geometry, and trigonometry, a description of the various materials used in machine construction, and the principles of machine tool design. A large amount of information concerning machine tools, including screw-cutting lathes, drilling and boring machines, planers, &c., is also given. The application of electric driving to these and other machine tools is dealt with, and other sections are devoted to belt and wheel gearing. In a section entitled "Shop Practice," much helpful information is given, and another useful section is that dealing with the proportion of machine tool parts. The whole is profusely illustrated with line drawings. This book should have a large circulation, especially amongst the more intelligent class of workmen and workshop apprentices.

REMOTE CONTROL OF STREET LIGHTING IN BERLIN

THE method adopted by the Berlin Elektricitäts-Werke for the remote control of the public arc lighting is described in an article by R. Mylo in a recent issue of the *Elektrotechnische Zeitschrift*. This system, which has been developed by the Allgemeine Elektricitäts-Gesellschaft, of Berlin, permits of any number of arc lamps of equal burning life, and connected at one point on the mains, being controlled from the central station by means of a single conductor. The accompanying diagram shows the connections in the local switch-pillar and also at the central station. In this diagram four groups of four arcs in series are shown connected to the three-wire continuous-current mains through the circuit-indicators *A*, *B*, *C*, and *D*, and the switch contacts *E* and *F*. Two groups are shown connected between the positive outer and the neutral, and two between the negative outer and the neutral.

When the lamps are switched off, the main switches, *E* and *F*, are in the position shown dotted, and the indicator solenoid *K*, being connected between the neutral and the positive main, the needle points to "out." To switch the lamps on, the attendant in the central station puts the switch, *H*, to the "on" contact, and this causes a current to flow through the closing solenoid, *L*, of the main switch, which is instantly closed. So long as all the arc-lamp circuits are complete, current flows from the negative main through all the series coils of the

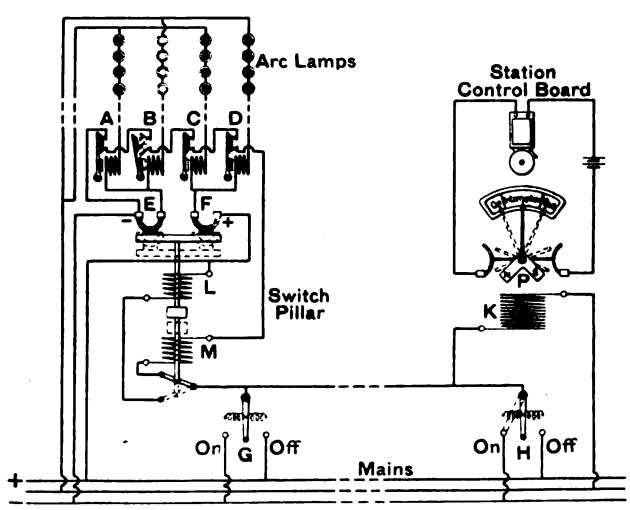

DIAGRAM OF CONNECTIONS IN SWITCH PILLAR AND AT CENTRAL STATION.—(ONE GROUP OF ARC LAMPS EXTINGUISHED.)

circuit indicators, *A*, *B*, *C*, and *D*, the coil, *M*, and the indicator solenoid, *K*, to the neutral main. As the current through the solenoid, *K*, is thus reversed, the other pole of the permanent magnet, *P*, will be attracted, and the indicator will point to "on." The attendant then releases the switch, *H*, which automatically springs back to the neutral position.

If an interruption in any one of the arc lamp circuits occurs, the magnet of the corresponding circuit indicator looses its magnetism, and the armature falls away, thus breaking the indicator circuit. Although this current normally flows through the opening solenoid, *M*, of the main switch, its cessation has no effect on the latter. The indicator in the station, however, points to "interruption," as, in consequence of there being no current in the solenoid *K*, neither pole of the permanent magnet, *P*, is attracted, and the pointer swings to the mid-position. This closes a bell circuit, as shown in the diagram, and the attendant is notified of the interruption. The accompanying diagram shows the circuit in the above condition—namely, all the lamps switched on, but an interruption in one arc-lamp circuit.

In order to switch the lamps off, the attendant at the central station puts the switch, *H*, to the "off" position; this causes a current to flow through the opening solenoid, *M*, with the result that the main switch is opened. Directly the contacts, *E* and *F*, are broken, the circuit-indicators, *A*, *B*, *C*, and *D*, loose their magnetism, the armatures fall away, and the indicator circuit is broken. It is established again, but with current in the reverse direction, when the small switch at the bottom of the main-switch plunger reaches the lower contact; the station indicator then points to "out," as explained before. In the case of a permanent interruption due to a fault in one of the arc lamps, a man is sent to the corresponding switch pillar, and then, with the aid of the control switch, *G*, can soon see in which group the faulty lamp is, by observing the circuit indicators. To prevent simultaneous use of the two control switches, *G* and *H*, the man at the switch pillar warns the central station attendant by telephone. Every switch-pillar is connected by telephone to the station. This system, which has been in operation in Berlin for some long time, is said to have given every satisfaction.

THE DEVELOPMENT OF THE ELECTRICAL INDUSTRY

THE first meeting of the 1908–9 session of the Newcastle Local Section of the Institution of Electrical Engineers was held at Armstrong College on Monday, when Mr. A. L. E. Drummond, the chairman of the Section, delivered his inaugural address. Mr. Drummond dealt first with the present position of the telephone industry. To-day the National Telephone Co. has 1,450 exchanges, with 450,000 subscribers' instruments and 1,100,000 miles of wire. The present position of the Post Office telephone system is that it has 30,000 subscribers' instruments. Municipal telephones have, he said, been a failure, as the remaining two municipalities now possessing their own systems—Hull and Portsmouth—have only 2,500 and 2,600 subscribers respectively.

After supporting the principle of the message rate system of charging, Mr. Drummond referred to the education question as applied to engineers. It was, he said, a moot point whether a young man qualifying for engineering should go straight from school to a technical college or to a shop, or whether a combination of these two methods should be adopted. The third alternative was probably the best, but under present conditions it was difficult to work properly in practice. Speaking on commercialism in engineering, the Chairman remarked that business is not sentimental. Designers and producers aim at bringing out the best article at the lowest prices, and commercial training had better be included in a student's curriculum than some subjects now considered obligatory. Turning to the developments of the past year, Mr. Drummond mentioned the important increase of power supply on Tyneside. The great station at Carville had increased fourfold in capacity during the last four years, having now the greatest output of any power station in Europe. Closely allied with this was the subject of turbines. Twenty-four years ago Parsons introduced his 10-h.p. engine. Nineteen years ago the first lighting station turbine was installed in the central station of the Newcastle & District Electric Lighting Co., Ltd. Seventeen years ago came Prof. Ewing's historic tests, and at a later date the turbine sets at the Manchester Square station, London, saved its reputation by abolishing the serious trouble experienced in the vibration caused by reciprocating engines. Interesting in this connection was the increase of size for a given speed of electrical machinery. Thirteen years ago the largest dynamo had an output of 120 kw. and a speed of 3,000 r.p.m. It was now possible to obtain 500 kw. at the same speed, and we could obtain 1,500 kw. in a single dynamo. In alternators the capacity had increased in the same period from 1,000 to 4,000 kw., and in the near future greater improvements could be expected as the conditions of overload, heating, and regulation were more exhaustively studied.

Underground Telegraph Wires.—In reply to a memorial from the Association of the Chambers of Commerce of the United Kingdom, making recommendations in favour of underground telegraph wires being laid to Land's End, the Postmaster-General states that in his last report he expressed the hope that the underground lines would reach Penzance during the current financial year, and he trusts no very long time may elapse before it is completed to Porthcurno, the point from which the Eastern Telegraph Co.'s cables start.

THE LATE PROFESSOR AYRTON

Tributes by Mr. W. M. Mordey and Prof. John Perry

THE meeting of the Institution of Electrical Engineers on Thursday last, at which Mr. W. M. Mordey was to have delivered his presidential address, was adjourned in consequence of the death of Prof. W. E. Ayrton, F.R.S., Past President, after speeches by Mr. W. M. Mordey and Prof. J. Perry.

Mr. W. M. MORDEY said :—Gentlemen, to-day many of us gathered round the grave of our revered past president, Prof. Ayrton, and joined, with the representatives of other societies in which he was interested, and in connection with which he did work perhaps as valuable as he has done for this society, in paying a tribute of respect to his life. We meet here to-night, not to inaugurate, in the usual way, a new session—our thirty-eighth session—but to mark officially, as the Institution of Electrical Engineers, our sense of the very great loss that we and electrical engineering and electrical science have sustained, and to send to Prof. Ayrton's family a message of our deep sympathy. In him we have lost one of our most useful and distinguished members. This is not an occasion when any account need be given of his life or of his work; the time for that will come later, but I may remind you that since this Institution was founded he has been one of the mainstays of it. He was elected a member in 1872, when the Institution was the Society of Telegraph Engineers. After twenty years of strenuous work to further the objects of this Institution, he became president, and before and ever since then his efforts have been continuous in furthering the objects that we all have at heart. For five years, from 1897 to 1902, he filled the office of treasurer, and the establishment on a sound foundation of the finances of the Institution is very largely due to the work that he did during that period. As for his usefulness, I need hardly refer to it. I have looked through our Journal and found that, during the 36 years of his membership, he has read before us 32 papers, most of them in conjunction with his old friend and colleague, Prof. Perry; but that was only a very small part, even of his written work. We lose in him one of the small band of learned teachers who have done so much to establish electrical engineering on the firm foundation upon which it rests. His early work in particular was especially useful. It was his idea to experiment always, to aim at accuracy and at measurement. These were the three words that express the leading idea of the practical work which he did at a time when he and a few others really placed practical electrical engineering measurement on a firm engineering basis. His work does not die with him; it lives in particular, I think, in his pupils and the men who learned from him to imbibe, not merely ordinary knowledge, but the principles of earnestness and endeavour, and the effort to be of service to their fellows, which was his great characteristic. His name is known all over the world; in fact, in every country where electrical engineering is known at all his name is known, and equally his pupils are all over the world. I think we may all claim to be his pupils. For myself, I attended his evening classes in 1881, and I think I am proud to say I have been his pupil ever since. This occasion is a sad one, but it is not proper that we should look entirely on the sad side. I think, as I ventured to say the other day with regard to his master, Kelvin, that whilst we deplored his death, we were glad that we could feel thankfulness for his life and for his work. We have lost a man who, I am sure, will always be looked upon as one of the founders of electrical engineering in this country, and I think that I cannot do less than say, in closing these remarks, that our last thoughts of him should be one of thankfulness for his life and for his example. Before closing the meeting I will call on Prof. Perry, his old colleague and friend, to speak, and then I will ask you to join with us in a resolution of condolence to his family.

Professor JOHN PERRY, F.R.S., said :—Gentlemen, I do not like very much to speak on this occasion. My partnership with Prof. Ayrton was for fifteen years, and we had a close friendship of over one-third of a century. My pride in having been Prof. Ayrton's partner and in sharing credit with him for work published in our two names warps my judgment. In Prof. Ayrton we have suffered a great loss. The service which we demanded from him as a member, and as a member of the Council, was a labour of love. It was seldom, so long as his health allowed, that he let any business, however important, interfere with his attendance, not merely at the general meetings, but at meetings of the Council and the Council committees of this Institution. The work of our Council has gradually become very complex, but to that work he brought an intelligence and keenness which perceived at once the essential point in every question, and a very large experience of the world. His love for the work gave a scope for that energy, that earnestness, that untiring industry, that hatred of inaction, which were his intense characteristics. But he also had a love for this Institution which was characteristic of Latimer Clark and General Webber, the love of the nurse or mother for the son who has gradually grown up to splendid manhood. I was privileged to assist Prof. Ayrton in his scientific work in Japan and England. When I arrived in Japan in 1875 I found a marvellous laboratory such as the world had not yet seen elsewhere. Fine buildings, splendid apparatus, intelligent students, and a never resting keen-eyed chief, of great originality and novelty; these were what I found in Japan. I am only occasionally energetic; he was always working at fever heat. I often expressed my annoyance at getting half the credit when about 20 per cent. of it was my fair share, and when we got back to England things went on in the same way. He arranged a laboratory of a quite different type at Finsbury, and later he arranged what is now, in my opinion, the finest laboratory in the world at Kensington, a combination of the ideas of Japan and Finsbury. He worked incessantly, and I continued to get half the credit, until at length the thing was insupportable, and I forced a rupture. He was at Kensington doing all the work; I was at Finsbury; and we met rather to discuss his results than for me to do anything. I hope you will forgive this apparent criticism; it is history. My self-respect caused me to force a rupture. But I was not angry; I loved and respected him all the time, and after a while I let him know this. I let him see that it had been the only course of action that was possible. Except for a few months, therefore, during exactly one-third of a century we were always the best of friends. He was not only a scientific experimenter, but he was a telegraph engineer, and, indeed, even in 1879 what we may call an electrical engineer. Educationally, the methods which he used at Finsbury were quite a new departure. Hitherto professors had experimented at the lecture table while the students looked on; but Prof. Ayrton held a brief not merely for the more clever, but also for the average student. Lectures were given, but what made them so intensely interesting was the illustrative experimental work which the student had to do with his own hands. His students learned by doing rather than by listening. Also he never aimed at creating a perfect engineer. He aimed at creating a learner, a man who would learn engineering when he had the chance, a man whose education would go on until he died. His methods have been adopted in every technical college in this country, not only in electrical, but also in mechanical engineering, and in other applications of science. Every one of his numerous inventions was schemed and studied, designed and experimented with, altered and used. Often after proving successful a thing was dropped because there was other and much more interesting work to look after. This is all old history now, but many of these inventions will be found to be essential parts of the most modern electrical machinery. I do not mention his later work with Mr. Mather, Dr. Sumpner, and others, because I know less about it. I speak of the pioneer time. If these things are forgotten, what does it matter? Ayrton, the pioneer, had a pleasure as pioneer which few people experience in this world. He was despondent towards the end, but he was despondent not because his work was forgotten—that was nothing—he was despondent because his failing body would not respond to his vehement spirit. He worked hard until he could work no longer, and when he knew that he could work no longer he died—heart-broken. Mentally he was strong until the end. He rests at last. He could not be restful living.

Mr. W. M. MORDEY then moved the following resolution :—

"That we, the President, Council, and Members of the Institution of Electrical Engineers, desire to convey to Mrs. Ayrton and to the other members of Professor Ayrton's family an expression of our deep sorrow at the death of Professor Ayrton, our revered Past President, and assure them of our deep sympathy in their bereavement."

After the resolution was carried by the members standing in their places, the meeting adjourned.

At the meeting of the Dublin Local Section of the Institution of Electrical Engineers on November 12th, a vote of condolence with the family and friends of the late Prof. Ayrton was passed.

A similar vote of condolence was also passed at the meeting of the Newcastle Local Section on Monday.

ELECTRICITY SUPPLY IN RESIDENTIAL DISTRICTS

THE address by Mr. George F. Pilditch, as Chairman of the Dublin Local Section of the Institution of Electrical Engineers, which was delivered at the meeting of the section on November 12th last, dealt chiefly with the question of electricity supply within purely residential districts. Perhaps of all the adverse conditions under which such undertakings have to work, said the author, their poor load factor is the most vital. There cannot be much demand for energy for power purposes unless, of course, it be used for tramways, but that is seldom the case, as the tramway system is rarely a purely local concern. Practically, then, the only apparent means of improving the load factor is by an extended use of electric heating apparatus and cooking utensils. In almost every case current for heating and cooking purposes can be obtained at quite a reasonable figure, and yet consumers cannot be persuaded to make use of it, because of the high initial cost of the apparatus. It can be demonstrated that the current consumed for cooking purposes is not by any means an expensive item; but so long as people are asked to pay such prices as 40s. for a frypan, 24s. for a kettle, 22s. for a flat-iron, and so forth, the prospect of such articles becoming of general use is almost hopeless.

Another adverse condition is the fact that in almost all residential districts the houses are situated some distance from the road, with the result that the cost of the services from the supply mains is out of all proportion to the revenue yielded. In Rathmines, for instance, the average length of cable used per house is about 55 ft., and the cost of the services on the solid system works out at about £7 each. This is a very big outlay, as in some cases the revenue per consumer only amounts to about £1 or 25s. per annum, the average revenue being about £6. The cost has been brought down to an average of about £5 10s. per service in Rathmines by using steel-armoured cable laid direct in the ground, but a very much cheaper service than that is wanted for small consumers.

Few undertakings supplying residential districts are wealthy enough to support a separate publicity department. Yet it is absolutely necessary that the advantages of the use of electricity should be constantly brought before the notice of the residents. I tried the effect some time ago in Rathmines of distributing 2,000 copies of a pamphlet, but only three residents asked for further particulars. I then tried the effect of putting on a canvasser to follow up the pamphlet, and for this purpose I selected the meter reader, who was well acquainted with the district, and able to give reliable information as to the consumption for the different classes of houses. The remuneration for canvassing was made dependent upon the results. This method has been attended with great success.

As an accessory to the canvassing, however, there seems to me to be a well-defined necessity for some sort of educational literature, such as that which the London undertakings are issuing regularly. A production of this kind is expensive, but something could be done in this way on the co-operative principle, so that the benefit of a system of literature distribution regularly and thoroughly carried out could be obtained on economical lines.

I am bound to confess that I do not believe in local electrical exhibitions. I would prefer to see something in the nature of permanent showrooms, where the local wiring contractors could exhibit their fittings under proper conditions in co-operation with the supply authority. At the same place accommodation should be provided for the collector and canvasser, so that inquirers could get all information they desire. An occasional demonstration of electrical cooking might be given with advantage.

A further difficulty is that the majority of houses are held under yearly or, perhaps, three-yearly tenancies. The tenants are therefore not prepared to spend money on the wiring. On the other hand, the landlords will not spend money on having their houses wired so long as they can continue to let them without doing so. A cheap form of wiring would get over this difficulty to some extent, but in order to make any real headway it must be possible for the supply authorities to put in installations free of cost, and to charge a small rental for the use of the same.

This brings me to the tariff question. For lighting purposes I am strongly in favour of a flat rate, particularly in residential districts. The average consumer wants to be able to switch on as many lamps as he requires at any time, and to know that so long as they are in use they are consuming electricity at a definite price per unit. It is also less difficult to obtain new consumers if you can offer them the supply at a fixed rate per unit.

As regards the probable effect of metallic-filament lamps on electricity supply undertakings, I do not think there will be such a serious falling off in the demand as some engineers anticipate. From some records in Rathmines which show the difference in consumption in seven shops, due to the use of metal-filament lamps, we find that in only two cases has the decrease in consumption approached anything of a serious nature. In three of the five remaining cases it is practically the same as when carbon-filament lamps were in use, and in the other two there has been a decided increase in the consumption. The net result of the undertaking is a loss of 77 units, but, on the other hand, every account that is reduced by means of more economical lamps becomes of immense service to the canvasser, as it forms an excellent bait for prospective consumers.

THE DOLTER SYSTEM AT OXFORD

AT a special meeting of the Oxford City Council last week some important letters from the National Electric Construction Co. with regard to the tramways in Oxford were presented, together with a report upon them by the Tramways Committee. It will be remembered that, when a few years ago the National Electric Construction Co. received Parliamentary powers to convert the horse tramways in Oxford to electric traction, the agreement between the company and the Corporation provided for the installation of the Dolter system, or, if the Corporation were not satisfied with this, for any other system of traction, except the overhead system. The company also bound itself under the agreement to pay certain annual sums to the Corporation by way of rent. In pursuance of this agreement a deputation from the Corporation was taken to inspect the Dolter system at Hastings and Torquay, but the Corporation were advised that the deputation was not satisfied as to the working of the system in these two places. Since then little progress has been made with the negotiations, but the company under date September 22nd inform the Corporation that they are now in a position to proceed with the financing of the City of Oxford Electric Tramways, Ltd., to enable the electrification of the tramways to be taken in hand, but that before any progress can be made the Corporation and the company must be agreed as to the system. With regard to the decision of the Corporation not to accept the Dolter system, the company agrees that there are defects in the system which cannot be overcome, and they, therefore, do not ask the Corporation to change their expressed opinion against the Dolter system. With regard to Torquay, the letter further states that an alteration in the system at an early date is not a remote contingency. After considering the effort made by the London County Council to adopt the "G.B." surface-contact system, the National Electric Construction Co. state they are forced to the conclusion that they are left with only two systems to consider, namely, the overhead and the conduit, but in view of the expenditure upon the latter they ask the Council's consideration of a scheme involving the use of the conduit system in the centre of the town and the overhead system outside, and at the same time ask for a reduction in the rental to about £800 per annum. The letter contains estimates of the various systems, in which the cost of the Dolter system for the 14 track miles which have to be dealt with is put at £120,160; the cost of a combined conduit and overhead system at £140,000; and the cost of an overhead system throughout at £100,000. These figures, however, do not include feeders, which would be the same upon any system. With regard to the rental the company point out that they are afraid that even £800 is in excess of what they could pay. Assuming, however, that £800 per annum were agreed upon, this would represent a reduction of £300 per annum for the first three years, £500 per annum for the next three years, and £700 per annum for the remaining years of the agreement upon the original sum agreed as the rent to be paid to the Corporation.

The Tramways Committee in presenting their report upon this correspondence recommend the Council to refuse to vary the existing arrangements, and further suggest that counsel should be asked to advise the Corporation whether it is necessary to take any steps at the present time to protect the interests of the Corporation.

After a lengthy discussion the Tramways Committee's report was adopted.

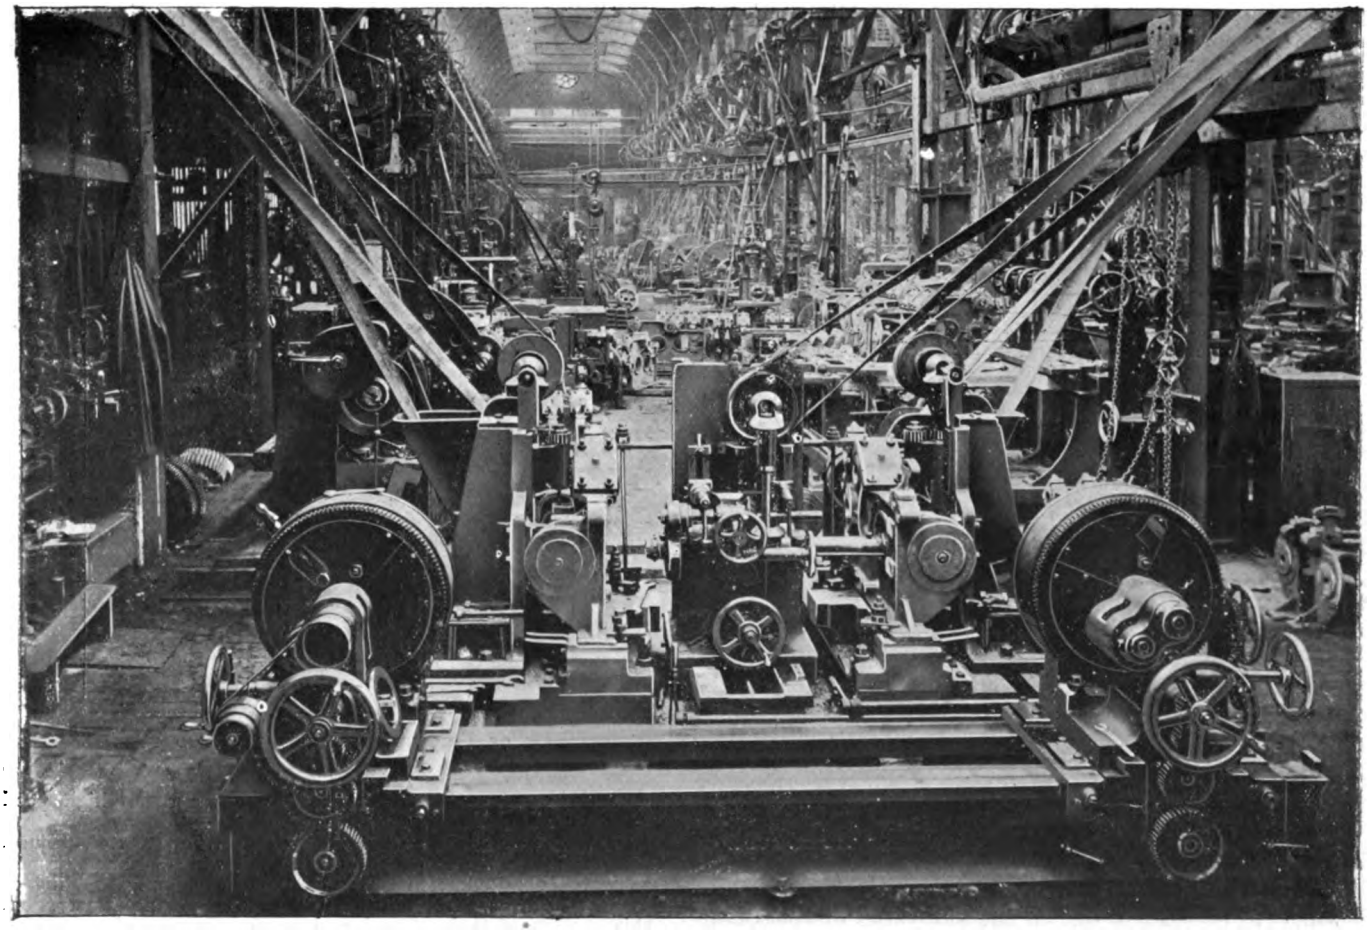
A VISIT TO THE WORKS OF MESSRS. CLARKE CHAPMAN & CO., LTD.

ON the roll of Tyneside firms which have taken such a prominent part in the development of ship equipments the name of Messrs. Clarke Chapman & Co., Ltd., occupies an honourable place, inasmuch as this firm has for many years been one of the pioneers in designing ships' winches and capstans, both steam and electric. At the present time it obtains a considerable share of Admiralty and general mercantile orders in these classes of goods, together with such manufactures as searchlights, coal hoists, and other accessories. In addition to this, their trade in boilers, both for marine and land use, and their water-tube boilers and pumps for all purposes, manufactured under the Woodeson patents, have rendered their name so well known as to be standard.



A Bay in one of the Machine Shops, showing Side Frame Boring and Drilling Machine in Foreground.

The present works of the firm have been in existence, with additions and alterations, since 1863, and it is therefore interesting to ascertain how electricity has been adapted for use in their extensive shops. It should be prefixed that the development of the works power of this establishment traces the progress of electrical equipment of workshops. Originally the motive power was derived from detached steam units working on longer or shorter lengths of shafting; when a direct-current three-wire supply at 240 and 480 volts was obtainable from the Gateshead power station of the Northern Counties Electricity Supply Co., Ltd., Messrs. Clarke Chapman availed themselves of it. Later, when this portion of the Northern Counties undertaking became merged into the general scheme of electricity supply throughout the northern portion of Durham, and operated by the County of Durham Electrical Power Distribution Co., Ltd., a three-phase supply was introduced into the works, and in many cases alternating-current motors operating at 440 volts are now being used.

The latest sub-station contains two static transformers, converting from 6,000 to 440 volts, and fed by duplicate lead-covered cables laid solid in the ground. These are fed from different points on the system, so that a failure of supply on any section will not put the sub-station out of commission. The cables are fitted with Merz-Price protective gear, while, in addition, the transformers have Brown-Boveri overload relays. The high-tension switchgear is of the Brown-Boveri type, while the low-tension board was made by the B.T.-H. Co. This latter consists of seven panels, two devoted to the transformers, three carrying the power circuits of the works, the remaining two being extra panels.

In the shops the majority of the lathes and heavy tools are driven from the direct-current supply, the three-phase power being used on the cranes and on the more recent extensions to the shops. As an example of the machinery which is electrically driven may be mentioned a fine milling and gear-cutting machine, made by Reinecker, of Chemnitz, which is in almost constant operation hobbing manganese bronze double- and treble-threaded gear-wheels which are used in the Clarke Chapman electric winches, in which both the

Digitized by Google

hob and the wheel are positively driven. These oil-immersed wheels are a standard feature of this firm's design, as, although the efficiency is not quite so high as single spur-reduction, a speed ratio can be obtained with a single pair of members that would have to be negotiated by two or three spur gears. This is an important point in connection with electrically-driven winches, and, taking into account that a 68 per cent. efficiency can be obtained in a double-threaded wheel, leads to the adoption of this type.

Another most interesting special machine—to chose one out of hundreds installed by the firm for their particular class of work—is a machine for milling and drilling the side-frames of steam-driven winches with one setting of the work. This machine is shown in the illustration on p. 609, and its operation is an instance of standard repetition work of large size that it would be hard to beat. Yet another application of electric power, which is of special interest, is a Thomson welder, installed in the blacksmith's shop for the purpose of operations such as the welding of lever handles, eccentric rods, &c., for the winches, windlasses, &c. It is capable of taking bars up to 3-in. diameter, and at the time of our visit the welder raised two pieces of 1½-in. round bar to a fluxing condition and united them in such a way that one or two strokes of a hammer completed the operation in 3½ minutes. Most severe tests have been applied to these welded parts, and the material at the weld has always been found of the same strength and nature as before welding.

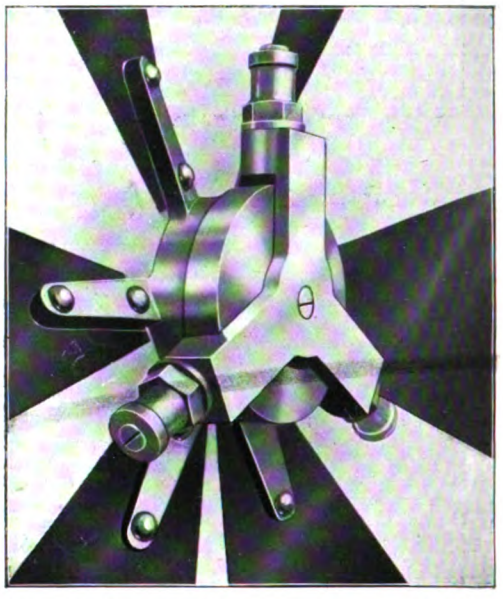
The artificial lighting of the shops is accomplished, as a rule, by means of open-type arc lamps, and in places where the hanging position of the lamp above ground is small, as in the case of side bays and galleries of the electrical shop, good diffusion is obtained by means of large whitened screens placed immediately above the lamps.

Messrs. Clarke Chapman & Co., Ltd., are, of course, not entirely electrical engineers, as their output of feed pumps, steam winches, and water-tube and other types of boilers testifies, but the applicability of electricity to marine purposes has led to the development of an extensive electrical manufacturing department. Much of the work is to Admiralty specification, and includes coal hoists for battleships, capstan gears, switch and regulating gear of special Government type, and searchlights, either of the ordinary or Suez Canal pattern, and having either hand or automatic control. They had also at the time of our visit a large amount of work passing through the shops destined for the mercantile marine, such as direct-coupled lighting sets, together with various orders for land installations. Among these latter could be mentioned an electric winch, destined for Messrs. Yarrow's new yard, a winch to be used in one of the shipyards of the Clyde Valley, lifting up to two tons at 200 ft. per minute, and a warehouse installation for China. A rather interesting piece of work then being finished was a turn-over capstan, the design of which permits of the complete opening up of the working parts for inspection without the necessity for getting down into the capstan box or dismantling any portion of the gear. Another object of interest was a special starter of the tramway-controller type, which this firm fits to some of its winches and hoists. Other particular objects of interest were the main, forward- and after-capstan gears, both electrically driven, for H.M. battleship *Defence*, and after-capstan gear for H.M. battleships *Temeraire*, *Superb*, and *Bellerophon*.

It will be seen from the above notes, which represent the impressions gained during a somewhat hurried visit to these works, that Messrs. Clarke Chapman & Co., Ltd., in developing along the lines of the needs of the shipbuilding industry, have built up a very flourishing and specialised industry of great interest, and hence the important part which electricity plays both in the power equipment and in the commercial output of the firm is a very encouraging sign of the times to electrical engineers interested in marine work.

SPEED REDUCTION COUPLING FOR ELECTRIC FANS

IN order that the best results may be obtained from a large propeller fan for ventilating purposes, it is necessary that the fan should rotate at a comparatively slow speed. At high speeds such a fan would not only be noisy, but the extra power absorbed would nearly all be wasted in churning up the air, instead of being utilised in imparting an increased velocity to the air. There is thus a most economical speed for any given fan, and for fans of about 30 in. diameter this speed is in the neighbourhood of 200 revs. per min. As the power required is very small, and small low-speed motors are necessarily heavy and expensive, it has been usual to run fans at higher speeds than the above, with the result that the continuous hum due to the churning of the air is in many cases unbearable. To enable a fan to be run at a low speed from a small high-speed motor, some form of silent and inexpensive reduction gear is necessary, but, in view of the difficulty in producing such a gear, a slipping coupling may be used. The latter, though not as efficient as a true reduction gear, enables a cheap high-speed motor to be used with a low-speed fan.



VIEW OF FRICTION COUPLING ATTACHED TO FAN.

The Glover-Lyon Ventilating Co., Ltd., of Caxton House, Westminster, have brought out a device, which, though termed a "Frictional Reduction Gear," is really a slipping coupling or a friction drive. As shown in the accompanying illustration, this consists of three arms keyed to an extension of the motor shaft. Morganite carbon brushes, contained in box brush-holders fixed to the extremities of these arms, bear on a phosphor-bronze ring attached to the hub of the fan blades. The relative speeds of the brushes and ring can be varied by increasing the pressure on the brushes. A 30-in. fan is to be seen at the company's show-rooms coupled to a 200-volt 1/10 h.p. motor running at 750 revs. per min. The fan rotates at only 200 revs. per min. The power actually utilised in driving the fan is thus only a little more than one-quarter of the power supplied by the motor, the rest being wasted in friction between the brushes and the ring. In consequence of the small total output of the motor, however, the ring does not get hot, and the energy wasted is said to be justified on account of the saving in capital cost. An overall efficiency equal to that of a slow-speed motor fan is claimed.

Rugby Engineering Society.—At the first conversazione of this Society, which was held at the Town Hall, Rugby, on Friday, November 6th, a large collection of scientific apparatus was exhibited, including various models lent by several well-known manufacturing firms. A series of lantern lectures, each of which lasted only fifteen minutes, was delivered by different members.

A LARGE THREE-PHASE ALTERNATOR AT NIAGARA

IN a Paper read by Mr. B. A. Behrend before the American Institute of Electrical Engineers at their summer meeting this year, a large generator is described which is included in a new generating plant of considerable magnitude completed recently at Niagara Falls. This station is the new plant of the Niagara Falls Hydraulic Power & Manufacturing Co. A number of large direct-current generators to be used for the manufacture of aluminium have been installed in this plant, each generating unit consisting of two direct-current generators connected to 11,000-h.p. turbines. A large alternating-current generator, one of an aggregate of three wound for 12,000 volts, has also been installed in this station. The power house is located at the foot of the falls, on the American side, below the old power house of the Niagara Falls Hydraulic Power & Manufacturing Co.

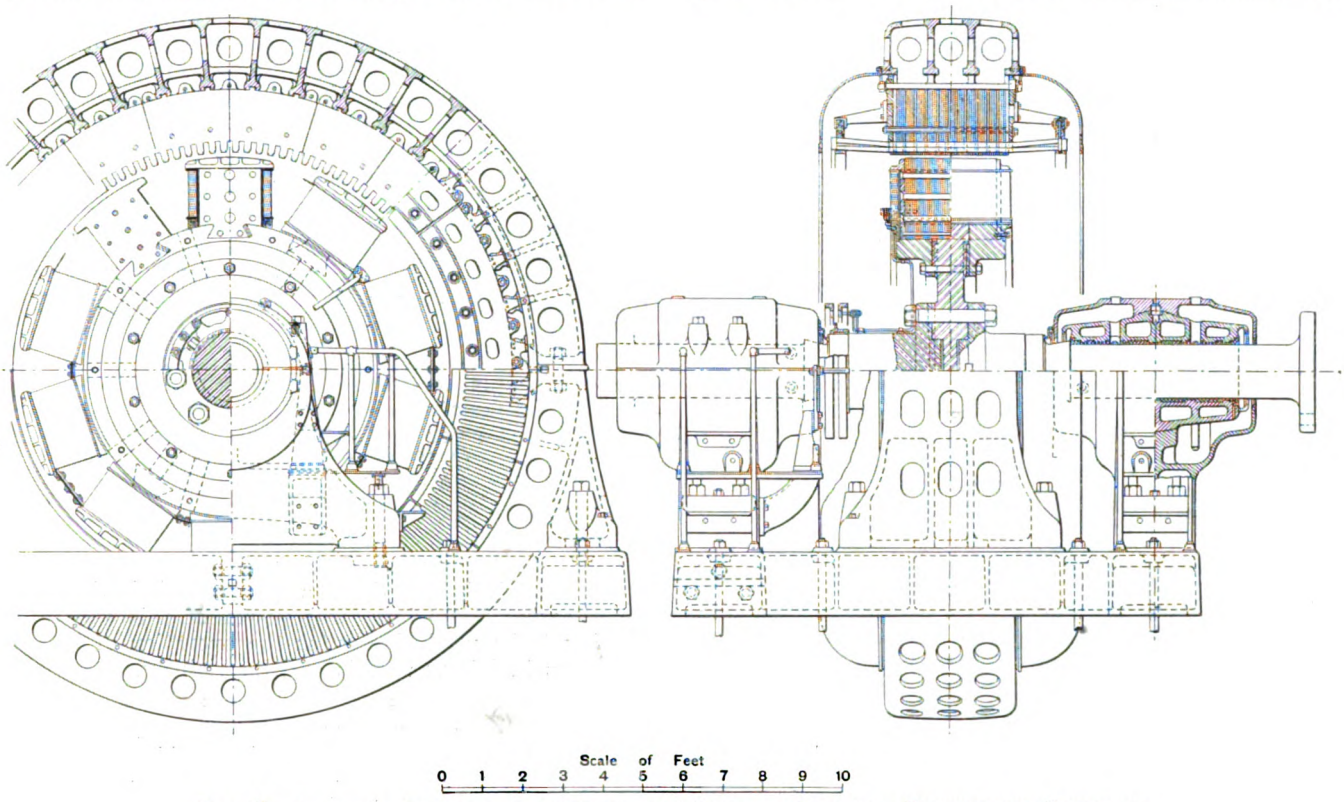

FIG. 1.—ASSEMBLY DRAWING OF 6,500-KW. 12,000-VOLT, 300 R.P.M. THREE-PHASE GENERATOR.

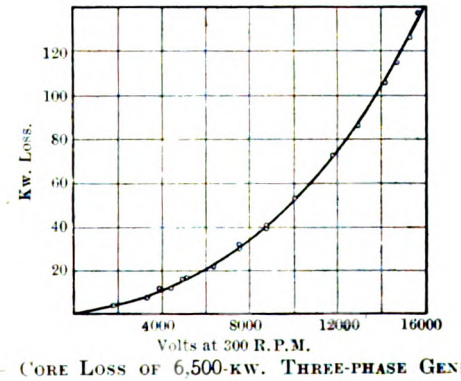

FIG. 2.—CORE LOSS OF 6,500-KW. THREE-PHASE GENERATOR.

The generator which is described in his Paper offers a number of interesting features, and is remarkable among the generators at Niagara Falls on account of its speed of 300 rev. per min., which is greater than the speed of any of the other large generators installed in the power houses at the falls. The generator is wound for 12,000 volts, three-phase, 25-cycles. The waterwheel is mounted on a horizontal shaft, and has a capacity of 11,000 h.p. The generator is rated at 6,500 kw., with a capacity for continuous operation of 7,500 kw. The runaway speed of the waterwheel is given as 506 revolutions; the generator, therefore, had to be designed to be safe at this speed. The experience which has been gained from the design of generators for direct connection to steam turbines has greatly minimised the difficulties of a problem like the one under consideration. Nevertheless, 11,000-h.p. generating units are neither so plentiful nor so readily designed and built as not to afford considerable interest.

The design and construction of this interesting unit, and the electrical characteristics, are illustrated by the accompanying drawing and curves. An assembly drawing showing the most important details is given in Fig. 1. The construction of the rotor is as follows:—A disc of nickel-steel, without a hole in the centre, forms the middle part of the revolving element. Two nickel-steel rings are mounted on each side of this web, and are bolted and keyed to it. The nickel-steel used for this

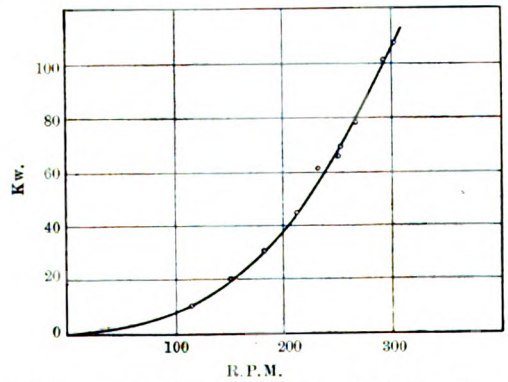

FIG. 3.—FRICTION AND WINDAGE LOSS OF 6,500-KW. THREE-PHASE GENERATOR.

Digitized by Google

construction must have great mechanical strength and high magnetic permeability. A nickel-steel containing 3·5 per cent. nickel has been used for this purpose. Its elastic properties are:—Elastic limit, 50,000 lb. per sq. in.; ultimate strength, 80,000 lb. per sq. in.;

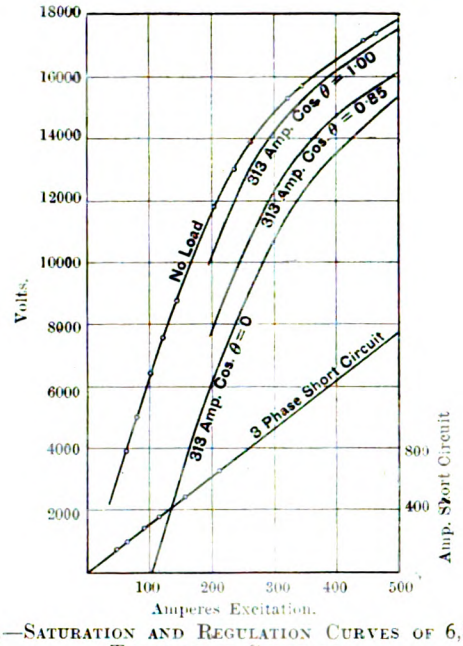

FIG. 4.—SATURATION AND REGULATION CURVES OF 6,500-KW. THREE-PHASE GENERATOR.

elongation, 20 per cent. in 2 in.; reduction of area, 40 per cent. The nickel-steel forgings as used in this construction enable the designer to produce the strongest and lightest construction, as the mechanical strength of the material is great and the magnetic permeability high. The weight of the complete rotor

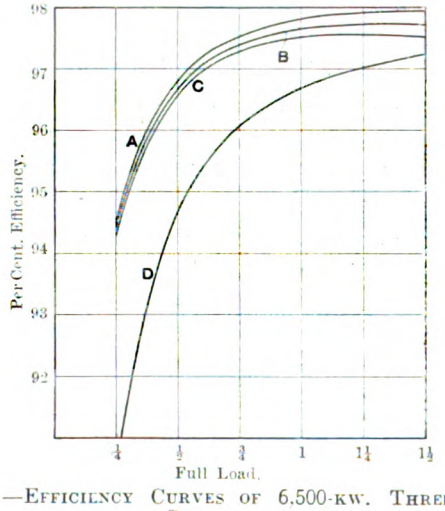

FIG. 5.—EFFICIENCY CURVES OF 6,500-KW. THREE-PHASE GENERATOR.

Efficiency not Including Windage and Friction.
A=6500 Kw. Output at 95% Power Factor.
B= ,, ,, ,, ,, 90 ,, ,,
C= ,, ,, ,, ,, 85½ ,, ,,
Efficiency Including Windage and Friction.
D=7500 Kw. Output at 100% Power Factor.

is only 92,900 lb., and, the bearings being 16 in. by 50 in., the specific pressure is only 58 lb. per sq. in. The weight of the stator is 116,700 lb., and the weight of the entire machine is 275,000 lb.

The following notes upon the theory of elastic stresses in rotating discs and rings are included in the Paper:—The theory of elasticity applied to the radial and tangential stresses in rotating discs shows that the point of maximum stress is at the centre of a disc and at the inside surface of a ring. The correctness of this theory has been demonstrated by experiments with lead discs, the deformation of which, as obtained by measurement before and after the test, readily indicates that the maximum deformation, as shown by the lateral contraction, appears at the centre of the discs or at the inside of the ring from where the metal flows toward the outside portions. The radial stress normal to a free surface must be zero, and, therefore, the maximum stress appears as a tangential stress. In a solid disc the elements at the centre are subject to both radial and tangential stresses. A hole in the centre eliminates the radial stress, and, as is shown by the theory, this doubles the tangential stress. Great mechanical strength and lightness are obtained in this rotor construction, and although it would have been possible to use a hub mounted on a shaft, according to the practice with slow-speed machinery, as the stresses on the inside of the hub would not have been prohibitive, the design adopted for this large generator is elegant and mechanically superior. The electrical characteristics of this unit are well shown in the curves of Figs. 2 to 5. Fig. 2 represents the core-loss which is equal to 75 kw. at 12,000 volts; this is approximately one per cent. of the output. Fig. 3 represents the power necessary to overcome the friction and windage at 300 rev. per min., which is equal to 106 kw. Fig. 4 represents the saturation and regulation curves of the generator with a regulation of 8·4 per cent. at full load and 100 per cent. power-factor at 12,000 volts. The generator is capable of giving 13,000 volts under any condition of load that is likely to occur, should this be required. Fig. 5 shows several efficiency curves. From the tests made regarding the heating of this unit, the temperature will remain within 35 degrees at normal load, and 40 degrees at 7,500 kw. The power of this generator is going to be used chiefly for the operation of induction motors in Niagara Falls and its vicinity.

LOW VOLTAGE WIRING

ON page 583 of our issue of October 29th we published an article by Mr. A. H. Dykes on "25-Volt Wiring," in which the relative advantages of the balancer-transformer, the auto-transformer, and the ordinary double-wound transformer were compared. The use of an ordinary double-wound transformer with a tapping from the centre of the secondary, and concentric wiring with uninsulated return, was suggested in the article.

Through the courtesy of Messrs. Handcock & Dykes we are now able to give a few particulars of two installations in which the wiring has been carried out on this principle. These are an extension to King's College, Cambridge, in which some 150 lights were installed, and the University Library adjacent with 146 lights. Both these buildings were wired on the "Kalkos" concentric system, in which two insulated wires (the outers of a three-wire system) are carried in tinned brass conduit, which is used as the neutral conductor. The supply pressure is transformed down by means of a double-wound transformer to 50 volts between the outers, and the middle point of the secondary winding is earthed and connected with the brass conduit. Twenty-five volt metal filament lamps are employed, and are connected between one of the outers and the conduit. Each circuit has 10-ampere fuses, and 7/20 cable is employed. All the joints in the conduit are soldered, and the same pattern of box is used for the switches, ceiling-roses, and drawing-in boxes. Ordinary 5-ampere Lundberg switches are used.

The lighting of all the buildings of King's College has been converted to either 25 or 50 volts, and in all fifteen or more transformers have been installed. With the exception of the above-mentioned extension, however, the wiring has been left as it was. To avoid the no-load losses of the transformers in the daytime, all

Digitized by Google

are switched off at the main board at a certain time at night, and are switched on again at dusk. The wiring in the extension building is all concealed, but in the library it is on the surface. The latter building contains practically no wood, the book-shelves being made of metal. The brass conduit, as well as all the switches, plugs, &c., are fixed to the metal framework of the book-shelves without the use of any wood. It may be mentioned that there are some electrically-heated bookbinding tools in use in this library.

The transformers were supplied by the Foster Arc Lamp & Engineering Co., Ltd.; the contractors for the Library installation were Messrs. Lucy & Co., of Oxford; and Messrs. Baily, Grundy & Barrett, of Cambridge, carried out the work for the King's College extension.

A few particulars of another installation may be of interest. This, although not a low-voltage installation, has been carried out on the same principles as the above. The building in question is Lumley Castle, Durham, the property of the Earl of Scarborough. In this case the supply pressure is 5,000 volts, and a double-wound transformer reduces this to 200 volts between the outers, which are carried in brass conduit connected to the middle point of the secondary of the transformer and earthed. One hundred-volt metal filament lamps are connected between one of the outers and the earthed tube.

THE TESTING OF ALTERNATORS

IN his Paper on the testing of alternators, read before the Birmingham Local Section of the Institution of Electrical Engineers on Wednesday, November 11th, Mr. S. P. Smith pointed out that although the Hopkinson method of testing electrical machinery was applicable not only to continuous-current machines, but also to alternating-current generators, motors, and transformers, it cannot be regarded as a method suitable for testing large alternators in a practical test-house, as it seldom happens that two similar machines are available at the same time. This has rendered it necessary to divide a single large alternator electrically into two units, namely, into a generator unit and a motor unit, and to circulate power between these units. For this purpose various methods have been proposed, of which, however, only a few have been successful in practice. The author had had, he said, an opportunity of extending certain methods of his own by numerous tests on large alternators, as a consequence of which a satisfactory and practical method has been developed.

Before describing his own method, the author referred to that of Behrend, which consists merely in splitting up the field into two halves. The full-load exciting current is then passed through each branch, and by gradually reducing the current in the one branch, the current in the short-circuited armature coils can be raised to the full-load value. Now, it is at once obvious that, with the armature on open-circuit under these conditions, the magnetic pull on the generator side will be much greater than that on the motor side, but since the internal angle of lag is almost 90° the armature ampere-turns on short-circuit are almost entirely direct in their reaction on the main field, the distorting effect being practically *nil*—that is to say, the generator field will be weakened and the motor field strengthened. This effect, it has been maintained by some, will equalise the motor and generator poles, and therefore remove all magnetic out-of-balance. A resultant pull must exist, however, in order that a current can flow in the armature as, as soon as the motor pull equals the generator pull, the flux in the motor portion equals that in the generator, and no current can flow owing to both E.M.F.'s being equal and opposite. This resultant magnetic pull may not be serious in the case of slow-speed alternators, but with high-speed machines the method becomes dangerous, and in some instances is absolutely prohibitive.

As an illustration of this, the author described a test which was made on a large three-phase generator built by Messrs. Siemens Brothers' Dynamo Works, Ltd., Stafford. This machine was built for 3,900 kilovolt-amperes 6,600 volts 342 amperes at cos $\phi = 0{\cdot}9$, there were 12 poles, and the speed was 500 revs. per minute. This, with a bore of 250 cms., gave a peripheral speed of 65 metres per second or 13,000 ft. per minute. An attempt was made to test the machine by Behrend's method. It was found, however, that even when 100 amperes were sent through the generator exciting coils and 50 amperes through the motor exciting coils the magnetic unbalancing was so great as to make it absolutely impossible to run the machine at anything like full speed owing to the severe vibrations of the stator on its bed. What the vibrations would have been like with the proper field currents—namely, 172 amperes in the generator half *versus* 15·8 amperes in the motor half (as afterwards determined by a modification of the above method explained below)—it would be difficult to contemplate.

In a modification of Behrend's method developed by the author a few years ago, the field is still split up into two halves, but the motor or weakly-excited poles are symmetrically interspersed amongst the generator or strongly-excited poles, so that the whole revolving system is balanced with respect to the shaft. Mechanically this method has proved quite satisfactory, even in the case of the above high-speed machine which was tested in this way. For this purpose poles 1, 2; 5, 6; 9, 10; formed one circuit, and was excited with 15·8 amperes; this was the motor half. The other group, consisting of poles of 3, 4; 7, 8; 11, 12; formed the generator half, and was excited with the full-load exciting current of 172 amperes. Under these conditions the full-load current circulated through the short-circuited armature, and the pull was zero, with respect to the shaft, since all poles were symmetrically balanced. Electrically, however, the results obtained by this method are not satisfactory for the following reasons:—In the first place, since only half of the field coils carry the full-load current, it is obvious that the proper heating will only occur on these poles, whilst the heating of the motor poles which never carry more than 10 to 20 per cent. of the normal exciting current is quite negligible. What the effect of this might be in the case of an open-type alternator, it is difficult to estimate, but, in the case of a totally enclosed machine this is a most important factor. Again, many machines which have to be tested by some such method as the above have an exciter, which must also be tested at the same time, and it is quite clear that the Behrend method is of very little use for testing the latter machine. Finally, although with the full-load armature current we get the proper copper loss in the stator, it still remains a question whether the temperature rise of the latter will be correct on account of the core losses not being the same as under actual full-load conditions. Only the core losses under the generator poles are anything like the actual, those due to the motor poles being of very little consequence. By comparing the temperature rise of the stator core when tested by Behrend's method with that under actual conditions, the temperature rise of the core was found to be little more than half that on full load, and the temperature rise of the copper was somewhat less than on full load.

From the foregoing it will be quite clear what are the essentials in any method of testing in order that the results shall be valid. Above all, it is highly important *that there is no dangerous resultant magnetic pull with respect to the rotor shaft.* This is the chief mechanical consideration. Electrically, the requirements are *full-load exciting current with full-load armature current and full-load core losses.* When these conditions are fulfilled, correct heating and losses in all parts of the machine are obtained, whence both the temperature rise and efficiency can be accurately found. At the same time, the exciter (if any) will be tested under normal conditions.

The author then proceeded to describe his own method, by means of which the above conditions can always be accurately fulfilled, unless the number of poles is too limited. In this method all the poles are in series and carry the full-load exciting current, hence full heating of the rotor is obtained, and the exciter works under normal full-load conditions. For the purpose of a clear explanation, the example of a 48-pole machine may be taken. Of these 48 poles, four groups were reversed, these groups consisting of two sets of 4 poles diametrically opposite, and two sets of 5 poles at right angles to these. Hence in all there were 18 poles reversed and 30 poles connected as for normal working. The latter were the generator poles and the former the motor poles. Thus there were 30 generator poles *versus* 18 motor poles. Under these conditions, full-load current flowed through the short-circuited armature when full-load exciting current was sent through the field coils, hence, provided the heating of the armature core is correct, there is little doubt about the heating of the stator copper, consequently the criterion of the test is the stator iron loss or core heating.

Some curves were shown by the author, which gave the results of two tests taken on the above machine on a dead load of 470 kw. at unity power factor, and two by using the author's method—that is, 18 motor poles *versus* 30 generator poles. These

Digitized by Google

curves showed that the temperature rise obtained by the author's test was the same as on actual load. In addition to this, the iron loss was measured on open circuit, both when the machine was excited with the poles normally connected and when 18 were reversed, by reading the input to the driving motor. This was found to be approximately the same in each case.

In the above test the rotor was opened at 8 places, but it could equally well have been opened at 4 places, provided the proper ratio of motor to generator poles were maintained. An experiment was made to see if it were possible to reverse all the 18 poles in one group, so that the rotor need only be opened in 2 places. On open circuit the machines ran quite smoothly with full-load exciting current in the field coils, but as soon as the armature was short-circuited the machine shook badly and the test had to be discontinued. The reason of this out-of-balance is quite clear, namely, armature reaction. From this it is seen that it is essential to have the rotor balanced, even in slow-speed machines, and for this purpose the minimum number of openings in the rotor is four, namely, two diametrically opposite groups reversed.

As a starting-point for the predetermination of the number of poles to be reversed we have *the E.M.F. induced by the resultant flux must equal the impedance volts*, or, in other words, the E.M.F. induced in the generator section must exceed that induced in the motor section by an amount equal to the reactance volts on full load, in order that full-load current may flow in the short-circuited armature. Hence if x = number of pole-pairs in generator section, y = number of pole-pairs in motor section, E_g = E.M.F. induced by one pole-pair in generator section, E_m = E.M.F. induced by one pole-pair in motor section, and E_r = reactance volts on full load, we have:—

$$x \,.\, E_g - y \,.\, E_m = E_r.$$

To find E_g and E_m we have merely to take the algebraic difference or sum of the field ampere-turns and the stator ampere-turns, and from the open-circuit characteristic read off the corresponding E.M.F.'s per pole-pair. This is due to the fact that the cross-magnetising effect on short circuit is practically zero, and the armature ampere-turns can be regarded as entirely magnetising or demagnetising, as the case may be. In order to solve the equation we have only to find some further relation between x and y. Now, it is obvious that, owing to the reduction of the flux wherever there are consequent poles, namely, at the openings, the sum $x+y$ will be less than p, where p is the number of pole-pairs in the machine. Virtually, at every opening, one pole—made up of two half-poles—is lost, neglecting for the time being the effect of saturation and armature reaction; consequently—

$$x+y=p-q$$

The effect of armature reaction at the pole openings, however, cannot be neglected, and a correction will have to be made for this. At the pole openings the back ampere-turns can be regarded as superposed on the exciting ampere-turns. Now, at every opening the armature reaction acts on a pole-pair; hence from the open-circuit characteristic must be read off the E.M.F. per pole-pair corresponding to the back ampere-turns. This E.M.F. must be then added to the motor voltage, which it assists. It has been found that the magnitude of this E.M.F. may be found with sufficient accuracy by taking half the difference of E_m and E_g. That is to say, if $\frac{1}{2} E_r$ denotes the voltage at each opening due to armature reaction, then $\frac{1}{2} E_r = \frac{1}{2} (E_m - E_g)$ or $E_r = E_m - E_g$; hence with q pairs of openings the voltage added to the motor section will be $q \,.\, E_r$. Thus:—

$$x \,.\, E_g - (y \,.\, E_m + q \,.\, E_r) = E_s.$$

All the necessary factors for solving the above equation can now be determined, and it is possible to predict how many poles have to be reversed for testing a machine under any given conditions.

To find the efficiency of an alternator connected in the above manner one has merely to measure the input to the driving motor when the alternator is running on short circuit, with full-load current circulating in the stator and normal exciting current in the field coils, then deducting from this the input to the driving motor when running light and uncoupled, the total losses in the alternator and exciter are at once obtained.

DISCUSSION.

Dr. W. E. Sumpner (Birmingham Municipal Technical School) pointed out that the method of testing, described by Mr. Smith, was due to the late Professor Ayrton, and was the subject of a Paper read before the Institution of Electrical Engineers in 1893 by Mr. W. M. Mordey. It was important that the core losses should not be altered by the conditions of the test, but at every opening where the generator and motor sections met, there was a distortion of the field, and consequently a change in the core losses from those occurring under normal conditions. Therefore there should be as few openings as possible.

Mr. R. A. Chattock (Chief Electrical Engineer, Birmingham) remarked that the temperature rise on machines tested by Mr. Smith's method was not quite so high as when tested on dead load. The question was whether such a test would be accepted as conclusive by consulting engineers and others. He also asked whether it were possible to carry out tests at varying power factors by this method.

Mr. Orsettich said that, owing to the consequent poles obtained by the Behrend method, the magnetic leakage was not the same as under normal conditions, and this would affect the core losses. He asked whether the exciting current used was such as would produce full load with unity power factor, and also whether the method was suitable for the testing of turbo-alternators.

Mr. Everest was of opinion that the core losses indicated by this method of test would not be the same as those occurring under ordinary working conditions. The temperature rise with full load could be accurately predetermined from the open circuit and short-circuit runs. If the machine was run on open circuit with an excitation corresponding to that required for full load, the rise of temperature due to heating of the cores could be ascertained. By running the machine on short circuit, the heating of the stator winding due to the resistance of the copper could be determined. From these two tests the total rise of temperature at full or any other load could be calculated.

Dr. M. Kloss (Siemens Bros. Dynamo Works) thought the method of testing most valuable, as it enabled full load tests to be carried out with a comparatively small amount of driving power, and was therefore extremely economical. He suggested that it should be adopted as the standard method by the Institution of Electrical Engineers. It would be useful if other firms would try the method in order to check its accuracy. Although owing to the consequent poles at the openings the frequency was somewhat reduced, yet the core losses determined by this method were rather higher than those occurring in normal running conditions. The method of determining the efficiency by calculating the losses separately always gave too high an efficiency.

Mr. A. T. Bartlett considered such tests quite necessary in dynamo-makers' works in order to check the efficiency of the machine before the regular steam consumption and efficiency tests were carried out. He said that it was well known that the Behrend test did not require the magnet poles to be equally divided. He did not see any difficulty in the measurement of the voltage regulation from full to no load.

Owing to the lateness of the hour the author's reply to the points raised in the discussion was deferred until the next meeting.

Institution of Post Office Electrical Engineers.—On Monday, November 9th, the Right Hon. Sydney Buxton, M.P., H.M. Postmaster-General, at a meeting of the Post Office Electrical Engineers' Institution, presented the medals awarded for Papers read in 1906–7. The Engineer-in-Chief, Major W. A. J. O'Meara, C.M.G., presided, and in the course of an address referred to the benefits which their branch of engineering had conferred. He said that the Postmaster-General had expressed the desire that the Post Office engineering enterprises should be conducted on a commercial basis. The Post Office engineers welcomed this proposal; nothing would give them greater pleasure than to play the same part in the engineering enterprises of the Post Office that the members of their profession played in commercial organisations. Lest, unfortunately, an impression might prevail that the engineers of the Post Office were not interested in the financial side of their work, not only would he draw attention to the fact that Papers on the commercial aspect of the Post Office engineering had been read before this institution, but he would also like to draw attention to Appendix R, page 96, of the Postmaster-General's Annual Report for 1908, where it was shown that the maintenance of the telegraph system in 1898–9 cost £617,616, and had increased in the year 1903–4 to over a million, but since then the expenditure had decreased so that in 1906–7 it was £947,657. The period of the decrease synchronised with that during which the Post Office engineers had become and remained responsible for their own accounting. The estimated expenditure for the present year had again gone up to over a million, but this could be accounted for by a reference to page 31 of the report, where it was shown that various increases of pay had been granted as a result of the report of the Select Committee of the House of Commons under the presidency of Mr. Hobhouse. He then went on to say that there may be some who might ask what has accounting for engineering expenditure to do with engineers? His answer was that it had as much to do with them as the consideration of the materials used by them has to the design, user, and efficiency of the mechanism of the telephone switchboard in which these materials are used. Medals were presented to the following:—Senior Division, Silver Medal, Mr. J. E. Taylor, for a Paper on the propagation of electro-magnetic waves; Senior Division, Bronze Medal, Mr. J. G. Hill, for a Paper on telephone transmission; Junior Division, Silver Medal, Mr. A. O. Gibbon, for a Paper on underground construction in the provinces; Junior Division, Bronze Medal, Mr. J. S. Brown, for a Paper on Post Office lamp signalling trunk exchanges.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 12th, 1908

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

1907 Patents

23,429. **Arc Lamp Carbons.** E. R. Grote and the Foster Arc Lamp & Engineering Co., Ltd. This specification describes a form of carbon electrode for flame arc lamps, consisting of two or more cores of hard carbon, each of which is surrounded by an equal amount of soft carbon. The arc will burn on only one pair of cores at a time, and will shift to a fresh pair when these are burned down. A longer burning life and a lower loss in the carbons owing to the increased section are claimed. Two claims, eight figures.

23,432. **Series Transformer System.** G. Berry. This invention relates to a modification of the "Berry" series transformer system (see Electrical Engineering, Vol. III., page 197), in which a small transformer used for light loads is short-circuited when the load is large enough to be taken up by the large transformer. According to the present modification, when one main and one auxiliary transformer are used in parallel with any number of large main transformers, the relay for operating the switch mechanism is controlled by the total supply current to all the transformers, and so has fewer turns and less inductance. The small transformer need have only a very small capacity. Two claims, one figure.

1908 Patents

1,770. **Construction of Induction Motor Rotors.** British Thomson-Houston Co., Ltd. (*General Electric Co., U.S.A.*). From the point of view of the designer, closed slots for the rotors of induction motors are better than open slots, since by reducing the reluctance of the air gap, the magnetising current is reduced, and by producing greater uniformity in the air gap, the eddy current losses in the stator teeth are diminished. Thus both the power factor and the efficiency of the motor are improved. Mechanically, however, closed slots are disadvantageous, as the dies required for punching the laminations are more expensive and the cost of winding is greatly increased, since former-wound coils cannot be used. According to the present invention the slots are stamped open, but after winding the core, a sheet of good transformer iron is wrapped round the core. The ends are either rivetted or welded. Slots are cut in the sheet, and the tops of the rotor teeth project through these slots. The sheet may be welded before it is placed on the core, and in this case it is dented afterwards so as to force the rotor teeth through the slots in the sheet. Two claims, seven figures.

15,079, **Manufacture of Metal Filaments.** H. Aron and A. Geiger. This specification relates to a process of decarbonising metal filaments by heating them to a high temperature in a vacuum chamber. No free hydrogen need be introduced, but it is necessary that a small percentage of water vapour should be present. The correct vapour density is obtained by inserting a vessel containing slightly diluted sulphuric acid or potash-lye in the vacuum chamber. One claim.

16,534. **Manufacture of Metal Filaments.** W. D. Coolidge. According to the process described in this specification, powdered tungsten or other refractory metal is mixed with a binder consisting of 42 parts cadmium, 53 parts mercury, and 5 parts lead. This binder gives the necessary ductility and strength, does not combine chemically with the refractory metal, and does not lead to trouble due to contained carbon. The mixture may consist of 30 to 50 per cent. by weight of tungsten. A small percentage of bismuth can be substituted for some of the lead in the alloy binder with advantage. Four claims.

17,456. **Gripping Insulator for Overhead Lines.** O. Graetzer. This is a development of the cable or wire connector described on page 651 of last week's issue. The wire is gripped between balls, which are forced inwards by the insertion of a tubular insulating piece, through which the wire passes, into a conical casing. When the insulator is in the proper position, it is caused to grip the wire, and is then fixed to the support by any suitable means. No binder is required, and it is stated that surface leakage is considerably reduced. Stretching the wire is also a simple matter. Two claims, three figures.

19,891. **Method of Cooling Commutators.** Siemens Brothers' Dynamo Works, Ltd., and E. O. Kieffer. Instead of providing longitudinal passages through the commutator segments or vanes on the under part of the segments, it is proposed, in this specification, to cut longitudinal channels on the undersides of the segments, and to divide the commutator longitudinally in two parts, the parts being connected by fan-shaped vanes. These vanes draw air through the channels from either end of the commutator, and exhaust it where the commutator is divided. Segments with such open channels can be cheaply manufactured; a commutator made in this way is suitable for high speeds. Three claims, three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25 Southampton Buildings, London, E.C., at the price of 8d. each, post free. The number and year of the patent should be quoted on the order.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

1907 Patents

21,463, Bolitho. Aim-recording apparatus.
23,448, Allgemeine Electricitäts Ges. Alternating-current commutator machines.
23,781, Deutsche Beck Bogenlampen Ges. Method of renewing the carbons of arc lamps.
23,950, Woods. Electroliers and ceiling roses.
23,957, Guy & Bennett. Contact breakers for internal combustion engines.
23,991, Theobald. Bayonet joint for lampholders.
23,997 Höveler. Smelting furnaces.
24,002, Chaudoir. Motor controlling apparatus.
24,396, Cowper-Coles. Manufacture of metallic calcium.
24,517, Herrenschmidt. Processes of melting in electric furnaces.
24,879, Baylor. Control of electric motors.
25,286, Brown. Telegraphy.
25,324, Hartnell. Electro-depositing apparatus.
25,970, Ericsson. Telephone receivers.
26,135, Farthing & Steanes. Enclosed arc lamps.
26,940, British Thomson-Houston Co. (*General Electric Co., U.S.A.*). Alloys for resistance conductors.
27,157, Maiche. Transformers.
27,488, Ambert. Rail joints.
28,482, Barbour. Brushes or collectors.
28,619, Ekstromer & Ekstromer. Process for the production of a substance from albumenoids for use with secondary batteries.

1908 Patents

72, Eisenstein. Production of undamped electrical vibrations.
282, Chilton, Newton, and Brush Electrical Engineering Co. Turbines.
661, Alexanderson. Dynamo-electric machines
1,779, Duddell. Vibration galvanometers.
3,076, Leon. Incandescent electric lamps.
8,104, Michaud & Delasson. Manufacture of filaments for illuminating and heating purposes.
8,416, Wolfram-Lampen Akt.-Ges. Filaments for electric lamps.
8,481, Benstead. Electric contact makers.
8,679, Pownall. Electric heating and boiling apparatus.
8,956, Benkö. Process for the production of a vacuum.
9,675, Evans. Electricity meters.
9,789, De Sainte-Claire. Variable-speed gear for electric automobiles.
10,769, Tate. Storage battery plates.
12,325, Woodbridge. Electrical distribution.
13,025, Lundberg, Lundberg, & Lundberg. Switches.
14,763, Akt.-Ges. Brown, Boveri, & Cie. Current collectors for electrical machines.
15,590, Sykes & Cooke. Control of traffic on electric railways.
16,986, Soc. Anon. Westinghouse and Brun. Direct-current motors.
18,457, Tucker, Tucker, Hudson, Cissell, Cissell & Rankin. Telegraph keys.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

1908 Patents

4,137, Bosch. Electrical ignition.
9,859, Kallmann. Motor starters.
22,105, Hartmann & Braun Akt.-Ges. Speed indicators.
22,168, Kompe. Trolley heads for overhead traction.
22,426, Peyrusson. Insulation of switches.

Expiring Patents

The following patents expire during the current week after a life of fourteen years :—

22,431, of November 20th, 1894. **Integrating Mechanism for Meters.** F. N. Connet & W. W. Jackson. An integrating mechanism suitable for adaption to electricity and other meters.

22,830, of November 24th, 1894. **Prepayment Meter.** R. T. Glover & J. G. Glover. A prepayment meter, the mechanism of which consists of two axially rotatable screw-threaded rods arranged parallel to one another, and a pinion in between which engages the threaded portions of the rods. One rod is rotated by the consumer and the other by the meter mechanism. The pinion operates the valve or switch.

PROPOSED TAX ON ELECTRICITY AND GAS IN GERMANY

THE Bill embodying the proposals for a general tax on electricity and gas in Germany has now been drafted, and was published, together with a long official explanatory memorandum, as a supplement to last Thursday's issue of the *Elektrotechnische Zeitschrift*. The Bundesrath and the Reichstag will consider the matter this session. In its present form the Bill is divided into five parts. The first of these relates to the imposition of a tax on electrical energy and gas; the second to the taxation of apparatus for illuminating purposes; and the other three to the penalties involved by a disregard of the law, and other administrative details. The following summary deals chiefly with those portions of the first two sections which relate to the taxation of electrical energy and electrical apparatus. For comparison, however, the main points of the clauses relating to the taxation of gas and apparatus for illuminating purposes other than electrical are also given.

PART I.

Taxation of Energy.

Electrical Energy.—All electrical energy consumed in the country, whether for power, lighting, or heating purposes, is to come under the tax. Electrical energy generated and distributed by any person or company, and paid for by the consumers, is to be taxed to the amount of 5 per cent. of the total selling price, but with a maximum amount of 0·4 pfennig (0·048d.) per kilowatt-hour. A uniform tax of 0·4 pfennig (0·048d.) per kilowatt-hour is to be imposed on energy intended solely for the use of the owner of the generating plant, but by arrangement this figure can be reduced to 5 per cent. of the total generating costs per kilowatt-hour, if it can be proved by means of authentic accounts that the figure of 0·4 pfennig exceeds this value; that is to say, if the costs per unit are less than 8 pfennig (0·96d.). The method according to which the costs are to be calculated is to be fixed by the Bundesrath (Federal Council).

Gas.—All combustible gas supplied to, and paid for by, the consumers is to be taxed to the amount of 5 per cent. of the total selling price, with a maximum amount of 0·4 pfennig (0·048d.) per cubic metre. Gas intended for the producer's own use is to be taxed to the amount of either 0·4 pfennig or 0·2 pfennig per cubic metre, according to the calorific value of the gas. As in the case of electrical energy generated by the consumer's own plant, the amount can be reduced to 5 per cent. of the total costs under certain conditions.

The revenue taxed is to be the total income from the consumers, inclusive of the meter rents, and if the charge is paid indirectly, or if the energy supplied is not charged for, a uniform tax of 0·4 pfennig (0·048d.) per kilowatt-hour or per cubic metre of gas is to be imposed, as in the case of consumption by the producer. In the case of gas-driven electric plants the tax will only be imposed once, not both on electricity and gas, and the Bundesrath are to decide whether the energy is to be taxed in the "primary" or "secondary" form.

Exemptions.—Gas, which can be proved to be so poor in quality that it has a calorific value of less than 1,000 large calories per cubic metre at 0° c. and 760 mm. pressure, is to be exempt from taxation. (By this blast furnace gas is exempt.) Also, if the apparatus or engine in which the gas is utilised is directly united with the producing arrangements as in regenerative furnaces, benzine, oil, and spirit motors, acetylene lamps, &c., the gas used is exempt from taxation. Electrical energy generated by a plant with a capacity of not more than 1·5 kw., and gas produced by a plant with a capacity of not more than 1·5 cubic metres per hour, are also exempt. Questions as to whether the nature, quality, or purpose of a gas cause it to be free from taxation or not, are to be decided by the Bundesrath.

Payment of the Tax.—Where electrical energy or combustible gas is generated in the country, the tax is to be paid by the owner of the generating plant, and where the product is brought over the border from generating stations in another country, the person or company who first deals with the product is to pay the tax. In the case of the product being delivered to a third party, who again sells it, this party is to pay a tax in respect of the difference between the price at which he buys the product, and the price he obtains. Payment is to be made quarterly in all cases.

Special regulations.—The Bundesrath is to have power to permit the determination of the amount of the product to be taxed by other means than by direct measurement; in certain cases of stations with a capacity less than 20 kw. or 20 cubic metres of gas per hour, the tax is to be an agreed sum.

The rest of the first section concerns such details as the compulsory announcement of the commencement of operation of a new generating plant, whether public or private; the assistance which must be given to the officials when inspecting the plant and mains; the instalment of approved measuring instruments, the cost of which must be borne by the producer; and other details with regard to meters. In the case of entire consumption by the producer, a small portion of the cost of the meters will be refunded.

PART II.

Taxation of Illuminating Apparatus.

This part of the Bill deals with the taxation of electrical and other illuminating apparatus intended for use in the country, under which heading are included electric glow lamps and the incandescing filaments used in them, incandescent mantles for use with gas, spirit, petroleum, and other gas lamps, carbons for arc lamps, and mercury-vapour and other similar electric lamps.

Amount of the Tax.—The amount of the tax to be imposed on glow lamps and filaments or burners for the same is to be as follows :—

(1) Up to 15 watts, 5 pfennig (0·6d.) per piece.
(2) From 15 to 25 watts, 10 pfennig (1·2d.) per piece.
(3) From 25 to 60 watts, 20 pfennig (2·4d.) per piece
(4) From 60 to 100 watts, 30 pfennig (3·6d.) per piece.
(5) From 100 watts and over, 50 pfennig (6·0d.) per piece.

The amount to be taxed on mantles or other incandescing bodies for gas and similar lamps is to be 10 pfennig (1·2d.) per piece. Carbons for electric arc lamps are to be taxed to the amount of 1 mark (one shilling) per kg. (2·2 lb.). The tax for mercury-vapour and similar electric lamps, 1 mark (one shilling) per piece up to lamps for 100 watts, and a further 1 mark for every further 100 watts or less.

Payment of the Tax.—The tax is to be paid by the manufacturer of the article in question, by means of the use of revenue labels, one of which is to be affixed to the packing of every article which is subject to taxation. In the case of imported goods the importing party must pay the tax at the customs office when the goods are inspected. The use of the above-mentioned revenue labels is not necessary if the articles subject to taxation are counted and notified by a revenue official before they leave the works. The tax paid on articles which have been returned to the manufacturer as faulty will be refunded. All articles subject to the tax must only be allowed to be in circulation in the country in packing which cannot be opened without destroying the revenue label, or some other label where these are not used. The contents of the packet must be given on the outside, together with the name of the manufacturer.

The remainder of this part of the Bill deals with the following details :—Compulsory announcement of commencement of manufacture of articles subject to taxation; assistance which must be given the revenue officials for inspection of the factories and store-rooms; and various other details of administration.

The Bill, if passed, will come into force on October 1st, 1909.

Published together with the Bill itself is a long explanatory memorandum, which contains interesting statistics with regard to the growth of the electrical industry in Germany, and reasons which, in the opinion of the Government, called for the various clauses of the Bill. The following is a brief summary of its contents :—

Most of the sources of revenue to the State show either no increase from year to year, or only a very slight increase, and it was deemed necessary to find some industry which would provide a revenue increasing with the population and trade of the country. The electrical industry appeared to be a suitable one for this purpose, as it has developed to a remarkable degree within the last few years, and promises to grow to still greater dimensions. The number of public electric supply works are increasing rapidly every year, and the number of private works are also increasing to a remarkable degree. Although the tramways have practically all been converted to electric traction, the electrification of the main railways has already been commenced, and this together with the increasing use of electric light will ensure a continued progress of the industry. The fact that there is so much difference between the works costs per unit in various stations, and between the average income per unit shows that there is still room for improvement, and that the lowest average price has by no means yet been reached. For example, the works' cost of electric power in Aachen, Berlin, Breslau, and many other towns is much lower than 10 pfennigs (1·2d.), and in many large towns, such as Achern, Dantzig, Karlsruhe, &c., it is over 20 pfennigs (2·4d.). The average income per unit varies between 20 and 40 pfennigs. With these great differences in the cost of production and in the selling price, it is claimed that a slight tax of a fraction of a pfennig would hardly be felt, although, in consequence of the enormous amount of elec-

Digitized by Google

trical energy used for all purposes, would bring in a substantial revenue to the country. However, it seemed hardly justifiable to impose a tax on electrical energy without imposing a corresponding tax on gas, its natural competitor, and for this reason gas has also been brought into the scope of the Bill. This latter industry has also developed remarkably within recent years, especially with regard to heating purposes, and a substantial revenue can also be expected from this source. In both cases the collection of the tax is considered to be a fairly simple matter, as the product can be taxed directly in large quantities at the point of generation. It is added that the figure of 0·4 pfennigs per kw.-hour, which is given as the maximum amount, will hardly be felt, as the lowest price even for power purpose, except to very large consumers, is not much less than 10 pfennigs (1·2d.) per unit. Even in such cases where electrical energy is used in large quantities, as, for example, in the manufacture of steel, it is contended that the imposition of such a small tax will not be felt severely. For example, in the case of a large steel works producing 400,000 tons of steel annually, and producing current for its own use at a cost of 2·5 pfennigs (0·3d.) per unit, the tax would only amount to about 8 pfennigs (0·96d.) per ton of steel. Manufacturers of aluminium, calcium carbide, and other large users will probably find the tax somewhat heavier; for example, it may amount to as much as 3 pfennigs (0·36d.) per kg. of aluminium, which costs about 1·8 mark (1s. 9d.). For tramways, the tax will probably amount to about 0·3 pfennig per car kilometre (0·058d. per car mile).

The probable revenue from the tax has been estimated to be 50 million marks (approximately £2,500,000) on the following considerations:—The total amount of energy bought from generating authorities amounts to about 1,000 million units per annum; that generated for private use about 5,000 million units. These together are estimated to bring in a sum of 17·4 million marks (approximately £870,000). Taking the amounts of gas as 2,500 million cubic metres in each case, a total revenue of 14·5 million marks (approximately £725,000) is expected. The taxes on illuminating apparatus are estimated to bring in a revenue of 23 million marks (approximately £1,150,000), of which the tax on glow lamps will contribute six million marks. The total of the above is 54·9 million marks, but the costs of administration and other expenses are expected to bring the total revenue down to about 50 million marks (£2,500.000).

The remainder of the memorandum contains explanations of the limiting charge of 0·4 pfennig per unit, the reason why one cubic metre of ordinary gas was assumed to be equivalent to one kilowatt-hour of electrical energy, and other details. It is stated that when estimating the tax on energy supplied by a generating station the 5 per cent. is to be estimated on the total income to the company or supply authority from the sale of energy. In comparing the illuminating capacities of electricity and gas respectively, it is stated that about 1,000 candle-hours can be obtained from one kilowatt-hour with tungsten lamps, and that an equal amount of light can be produced by one cubic metre of gas with an inverted mantle. For power purposes also one kilowatt-hour is assumed to be equivalent to one cubic metre of ordinary gas, as although a somewhat larger output can be obtained with the latter, the attendant expenses are greater. Ordinary gas and water-gas are assumed to come under the 0·4 pfennig per cubic metre regulation, and producer gas under the 0·2 pfennig rule, but furnace gases will not be taxed, as their calorific value is below 1,000 large calories per cubic metre.

LONDON ELECTRIC POWER BILLS

Proceedings before House of Commons Committee

On Wednesday last week, at the close of the case of the "Eight Companies" against the London and District Electricity Supply Bill, Mr. Gerald Sander presented the opposition of the Islington Borough Council, which was upon the same lines as that of other Councils in the proposed area. Then followed the four West End companies, viz., the Westminster, St. James and Pall Mall, Kensington and Knightsbridge, and the Notting Hill companies, who are really now in line with the other companies, in that their respective Bills contain the same clauses, and there is now no opposition between the two. The case for the four companies rests upon a somewhat different basis, however, their areas being admittedly residential, and consequently offering no inducement to a power company. The latter retort, however, to use the expression of Sir Hugh Bell, that "We want you"; in other words, the promoters wish to retain the West End area in their Bill mainly for the purpose of supplying the authorised distributors in bulk. This being so, it was put to the committee that the power company, in order to force the authorised distributors to take a supply, would approach the very small power users that were to be found in the West End, and use them as a lever. Mr. Seymour Bushe, K.C., for the companies, urged that the Bill was really a gamble. The whole success of the scheme lay in the promoters securing the authorised distributors, and the Bill would leave the door open for illegitimate pressure to be put upon the present undertakers. Sir Alexander Kennedy, F.R.S., further expressed the opinion that the Bill could not be a success commercially.

For the Middlesex County Council, evidence was called pointing out the undesirability of allowing any portion of Middlesex being included in the area, first, because there is a power company already there, and secondly, because, under the proposed purchase terms, the London County Council would get a "foot in" Middlesex. By the way, the appearance for the first time before the Committee on behalf of the London County Council of Mr. Freeman, K.C., is an interesting sequel to the discussion at the Council's meeting last week. Originally the Council had not retained counsel against the Bill in the House of Commons, but the belated appearance of Mr. Freeman is for the purpose of protesting against the purchase clause contained in the Board of Trade report, should clauses be reached. The City Corporation instructed its legal representatives to ask the Committee not only to reject the bulk supply Bill, but to make a suggestion in their report that the Board of Trade should call a conference to endeavour to arrive at a solution of the question by utilising the existing resources. The Chairman, however, intimated that the Committee would go no further than saying "Aye" or "No" on the preamble of the Bill. Thursday's proceedings closed with a clever attempt on the part of Mr. Balfour Browne, K.C., to find out the possible verdict of the Committee, which, it was stated, would in all probability be given on the following Tuesday or Wednesday. Mr. Balfour Browne asked the Chairman to name a day upon which the London Electric Supply or "eight company" Bill would be taken. The Chairman stated that in the event of the preamble of the present Bill not being found proved, it would be possible to start on Wednesday with the other Bill. If, on the other hand, the preamble was passed, the clauses would take a little time, and it might not be possible to start the second Bill until Thursday. "Shall we say we will start my Bill on Wednesday, then?" queried Mr. Browne, amid laughter. "You had better say Thursday," was the answer.

On Tuesday, Mr. Balfour Browne spoke on behalf of the North Metropolitan Electric Power Supply Co., for whom also Mr. James Devonshire, the Managing Director, and Mr. E. T. Ruthven Murray, the Chief Engineer, gave evidence. The case for this company is, of course, based upon competition, and it was urged that there was no precedent for competition between two electric power companies. It was also pointed out to the committee that Mr. Merz in 1905 had excluded any portions of the area of the North Metropolitan Co. from his Bill. The Hon. J. D. Fitzgerald, K.C., occupied a good portion of Tuesday and several hours on Wednesday with his reply. Before he commenced, however, Mr. Freeman, K.C., on behalf of the London County Council, intimated that they were quite satisfied with the Bill as it stood, and he would desire to have something to say upon the Board of Trade report. The Chairman pointed out that this report would only come under consideration when the various clauses of the Bill were being discussed, and that Mr. Freeman would then have his opportunity.

Mr. Fitzgerald, in his speech, maintained the position he took up in opening the Bill in both Houses, namely, that the opportunity of obtaining a supply in bulk from a large generating station was a valuable option to the authorised distributors, and at the same there was no obligation of any kind upon them to take it. He further argued that none of the evidence brought forward in opposition to the Bill was of a character that would influence the Committee to give such a decision as to prevent the Bill passing into law.

Mr. Fitzgerald was still continuing his speech yesterday when we went to press.

L.C.C. Report on the Bills

THE Parliamentary Committee of the London County Council has reported upon the three Electric Power Bills now being considered by Sir Luke White's Committee.

LONDON AND DISTRICT ELECTRICITY SUPPLY BILL.

The Committee point out that a new situation has now arisen in regard to this Bill by the issue of the Board of Trade report (ELECTRICAL ENGINEERING, November 5th, p. 618). The principal points arising on this report are in connection

Digitized by Google

with the purchase clause, both in regard to the dates and terms of purchase. Where these are in conflict with the agreement arrived at between the Council and the promoters, the report states, it is obvious that the Council must adhere to the terms of the agreement which they think adequately safeguards the interests of the public. The special attention of the Council, however, is directed to one suggestion in the report with regard to the purchase clause which is considered to be most important. This suggestion is as follows:—"The Board suggest that provision should be made by the clause not only for compulsory purchase at certain dates, but also for enabling the London County Council to purchase the undertaking at any time on terms to be agreed by them with the company."

The purchase clause already contained in the Bill, it is pointed out, not only provides for purchase in 1961 on Electric Lighting Act terms, but also provides for purchase in 1931, 1941, or 1951, on payment of an additional sum for compensation in respect of loss sustained by the company by reason of such purchase taking place at a date earlier than 1961. Consequently, in 23 years from the present time, or at successive periods of 10 years, the option to purchase could be exercised, and the public would be in a position to avail itself of any benefits which might accrue from the exercise of the powers of purchase at a time when it would be possible to estimate with some certainty the financial results and possibilities of the undertaking, and after the earlier and more speculative stages of the enterprise have been passed. The Council, both in the session of 1907 and on the present Bill, has consistently adopted the attitude that any undertaking such as that under consideration should be carried on by means of private enterprise, subject to proper public control, and that money raised on the security of the rates should not be risked in the initial stage of developing the undertaking. The suggestion made by the Board of Trade, however, reopens the whole question, and if adopted, would be directly antagonistic to the Council's policy. It would make it possible for the undertaking to be taken over by the Council in its preliminary stages when but little, if any, of the estimated expenditure (£6,000,000) had been actually incurred, and before any sufficient opportunity of judging as to its prospects had been afforded. Under the circumstances, therefore, the Committee think the Council will desire to express its disapproval of the proposal and venture to hope that it may not be seriously pressed before the Select Committee. One or two further points arise on the report, including the question of some readjustment or modification of certain powers of the Council under existing Acts and Provisional Orders with respect to electrical undertakings, which will necessitate the Council being represented before the Select Committee on the Bill. Further it may be necessary in order to preserve the Council's *locus*, to seal and present a petition against alterations in the Bill. The Committee therefore recommend:—(*a*) That, as the Council has not asked for the power, as suggested in the report of the Board of Trade, on the London and District Electric Supply Bill, of purchase by agreement before the periods specified in the purchase clause now contained in the Bill, and having regard to the fact that a purchase to be authorised by the Bill of the undertaking at an early stage of its existence would be open to the same objections as have been expressed against the Council itself embarking upon such an enterprise, notably the financial risk to the ratepayers of such an extension of municipal trading over an area several times larger than the county, the Council is of opinion that such an amendment as that suggested by the Board of Trade would be undesirable. (*b*) That, if necessary, a petition be sealed and presented, against alterations in the London and District Electricity Supply Bill, 1908.

London Electric Supply and London (Westminster and Kensington) Electric Supply Companies Bills.

The Committee report that these Bills have been read a second time in the House of Commons and that instructions have been passed by that House at the instance of the Government in regard thereto (Electrical Engineering, November 5th, p. 619). The subject matter of these instructions has already been before the Council and gives rise to questions of considerable importance. Having regard to the decision of the Council on July 28th and 29th, 1908, that no opposition be offered to these Bills on second reading in the House of Commons, the Committee have not up to the present thought it necessary to take any active steps in regard to the proceedings before the Select Committee on the Bills, but in view of the above instructions they are giving the whole matter their careful consideration.

This report was agreed to, after a short discussion, at the Council's meeting on Tuesday.

LOCAL NOTES

ABERDEEN: *Underground Telephone Wires.*—The conduits for taking the telephone wires have now been laid in all the principal streets, the number of thoroughfares dealt with being about 200, and the total length of road some 21 miles. Restoration of the streets has been carried out by the borough surveyor, the cost of which, in addition to the maintenance of the disturbed streets for six months, is to be defrayed by the Postmaster-General. The remaining work will be carried out by agreement between the Corporation and the National Telephone Co.

ARGENTINE: *Electric Supply in Tucuman.*—The Tucuman Senate has, says the *Review of the River Plate*, approved a Bill authorising the creation of an official electric supply station. Concessionaires for the electric tramways in Tucuman have resumed the constructional work, which has been stopped for some considerable time.

AUCKLAND (N.Z.): *Tramways.*—The total revenue from the Auckland tramways during the past financial year amounted to £140,451, and the working expenses to £82,885. The interest on the debenture stock and loans, depreciation, &c., absorbed £48,147, leaving a balance of £9,419. From this is deducted 1 per cent. sinking fund, leaving a net profit of £3,069.

BARNES: *Street Lighting.*—The Electrical Engineer recommends that all lamps in the main roads should be changed from 50 c.p. Nernst to 100 c.p. Osram. The cost of changing over will be 12s per post for 150 posts. It was resolved, as a commencement, that twelve 100 c.p. Osram lamps be placed in the existing posts in Castelnau and twelve in Sheen Lane.

CHESTER: *Fraudulent Use of Electricity.*—A Chester hairdresser and tobacconist was fined £20 and costs last week for having his lamps connected to a power meter from which a fan was being supplied at power rates. In this way he obtained his lighting at power rates instead of the lighting rate, which is 3½d. per unit. The power rates in Chester are for the first 200 units 1½d. per unit and above that amount 1d. per unit. It was calculated that the defendant's bill, which should have been £19 10s. 6½d., was only £7 2s. 7d.

CLACTON: *Battery Inspection.*—The Electric Lighting Committee's recommendation that notice be given to terminate the contract with the D.P. Battery Co. for inspections and reports upon the Council's battery has been adopted.

CLITHEROE: *Electric Lighting Order.*—A letter has been received from the Board of Trade *re* the Council's Electric Lighting Order, asking what steps were being taken to carry it out. The Town Clerk has been instructed to reply that the matter is having consideration.

CONSTANTINOPLE: *The Tramway Co.—The Financial News* states that the Tramway Co. of Constantinople will shortly increase its capital from £T600,000 to £T940,000. Hitherto the chief voice in the affairs of the company has been held by the Continental Co. for Electrical Enterprise.

COSELEY: *Subsidences on Tramway Track.*—The Wolverhampton and District Electric Tramways Co., Ltd., having been asked to revert to the system of reduced children's fares formerly in use in the district, the company asked whether, in the event of making this concession, the Council will be willing to forego in future payment of the annual sum of £25 which is provided in the agreement of March 31st, 1899. In view of the heavy calls in respect of mining subsidences, and consequently excessive costs of repairs to the tramways in the Coseley district, the company regard this payment as an unfair burden from which they should be relieved. It may be mentioned that when the tramways company were granted concessions in the district, the Council received £1,000 down, and, as stated above, £25 per annum in perpetuity, and the matter is now under consideration by the Council.

DENNY: *Electric Lighting.*—A supply from the Fife Electric Power Co. is now available, and was switched on last week. The supply is given by means of overhead wires. Public lighting is now under consideration.

DUNDEE: *The New Power Station.*—Complaints are being made at the delay in completing the new power station. The Chairman of the Electricity Committee, however, states that nobody is really to blame. The fault lies with the Town Council itself, inasmuch as on several occasions there have been diversions from the original plans. The electrical engineer reports that Willans & Robinson, the contractors for the turbo-generators, who have been paid £10,000, now claim another instalment of £4,000, with interest, as from September 3rd, 1908.

Street Lighting.—With reference to the situation which has arisen over the lighting of the Hilltown, the Committee in charge had a meeting this week on the site, when they decided on arc lighting. Their decision has since been confirmed by the Town Council, who have instructed the gas department to have the lamps which they recently erected removed. It will be remembered that the gas department erected four lamps each within twelve yards of the four existing arc lamps, but on the meeting night it was quite apparent that only one result could be come to.

FALMOUTH: *Trackless Trolley System.*—The Corporation are considering a scheme for the provision of trolley omnibuses.

Digitized by Google

GRIMSBY: *Supply for Wireless Telegraphy.*—The Council has now sealed agreements with the Admiralty in regard to the wireless telegraph station under construction at Humberstone. These agreements have reference to the supply of electrical energy, the laying of high-tension cable, and the maintenance of the cable and plant. The Admiralty undertakes to purchase all current required from the Corporation at agreed rates for a term of years, the Board of Trade to settle any disputes that may arise.

HERNE BAY: *Electric Lighting Provisional Order.*—An application has been made to the Board of Trade for an electric lighting Provisional Order.

HEYWOOD: *Electricity Supply.*—In a General Powers Bill which will be promoted next session, the Corporation seeks powers to the free wiring of houses for electric lighting and other purposes, and the fixing of meters, &c., upon consumers' premises. Authority is also sought for supplying local authorities and others in districts adjoining Heywood with electricity. The stand-by clause is also included.

KIRKINTILLOCH: *Proposed Tramways.*—The Council has agreed to send a deputation to wait upon the Tramways Committee of the Glasgow Corporation, urging the extension of their tramways to Kirkintilloch.

LONDON: *London County Council: The London Traffic Board.*—The General Purposes Committee of the London County Council report that the Prime Minister has agreed to receive a deputation from the Council to urge the necessity of securing the establishment of a London Traffic Board upon the lines indicated in the report of the Royal Commission on London Traffic. Thursday, November 26th, has been fixed as the date of the reception of the deputation.

Tramways.—In connection with the construction of tramways across Hammersmith Broadway, the Highways Committee recommend that authority be sought in the next session of Parliament to enable these to be laid in a different position from that authorised by the London County Council (Tramways and Improvements Act, 1903), and to amend Section 5 of that Act so that the Council may use the lines for public traffic before the widening of the northern side of the Broadway is effected.

In the King's Bench Division last week, a Mr. J. S. Yates, commercial traveller, of Palmers Green, was awarded £220 damages for injuries received in a collision between two tramcars in Brixton in November, 1907.

A deputation from the Woolwich Borough Council waited upon the Highways Committee of the London County Council on Thursday, urging the construction of the tramway to Eltham. Mr. S. Benn, who presided in the absence of the Chairman of the Highways Committee, assured the deputation that the petitions received from Eltham and Woolwich had not been lost sight of. It had been decided to adopt the overhead system, but the Astronomer Royal objected on the ground that it would interfere with the scientific instruments at the Greenwich Observatory. If, on the other hand, they were to adopt the conduit system the lines would prove a financial failure. The Highways Committee were considering a way out of the difficulty, and were seeking expert advice on the question. If, when this expert report had been received, it was found that the overhead system could be used, the construction of the line would be started at once.

The Highways Committee of the Paddington Borough Council recommend that the consent of the Council should be refused to a proposal to construct tramways from Harrow Road, via Sutherland Avenue, to Maida Vale, on the ground that such lines would depreciate the value of property in Sutherland Avenue and adjacent streets, and further, as they would not link up any of the other tramway services, they would serve no useful purpose.

Marylebone: Electricity Accounts.—The revenue statement and financial return for the June quarter of the electricity undertaking shows that the total expenditure amounted to £10,722, against £12,034 for the corresponding quarter last year. The cost per unit sold worked out as follows:—Generation expenses, 0·754d.; distribution expenses, 0·232d.; management expenses, 0·334d.; rents, rates, and sundries, 0·220d.; special distribution expenditure, 0·066d.; a total of 1·606d., compared with 1·778d., exclusive of the last item. As compared with the corresponding period in 1907, generation costs were lower by 0·051d. per unit, distribution costs 0·143d. per unit, owing to reductions in staff and other economies; management expenses, 0·2d., notwithstanding the larger amount expended this year in the work of the publicity department, and its efforts at extension of business, and rents, rates, and sundries improved by 0·024d. Under all heads the net decrease per unit was 0·172d., or nearly 10 per cent. The gross income showed a diminution of £2,501, as compared with the corresponding quarter, brought about by the more extended use of new and economical types of lamps, and a change in the dates of reading the meters, about seven days later than previously. The return adds that the sales returns for the September quarter show that the fall in units sold for the June quarter has been more than overtaken during the following three months.

MONTEVIDEO: *Underground Telephone Mains.*—In connection with the request of the Montevideo Telephone Co. to the Government of Uruguay for a concession allowing them to lay their mains underground, the question of pressing the Government for a reply has recently been under consideration. It has now been decided to send a representative to South America in order to ascertain the position of things, and it is not thought likely that any steps will be taken pending the receipt of a report from this gentleman.

MORECAMBE: *Tramways.*—The Corporation have given notice of their intention to deposit a Bill for the acquisition of the Morecambe Tramways Co., and the conversion of the lines to electric traction.

NEWCASTLE: *Electrical Exhibition.*—The Newcastle Electric Supply Co., Ltd., are holding an exhibition this week in their showroom at Hood Street of the latest appliances for electric heating and cooking. This branch of the company's business has made rapid strides in the past few years. Two years ago there were only two electric irons connected with their mains, whilst now there are 600.

OLDHAM: *New Chairman of Electricity Committee.*—Alderman Bolton was re-elected Chairman of the Electricity Committee at the first meeting of the new Council.

OSWESTRY: *Reduction in Electricity Charges.*—The directors of the Oswestry Electric Lighting & Power Co. have decided to reduce the price of current, and the following charges will come into force from January 1st, 1909:—Lighting, 5½d. instead of 6d. per unit; for heating, cooking, and power purposes the following scale will be enforced up to 250 units per quarter, 2d. per unit; from 250 to 500 units, 1½d. per unit; from 500 to 25,000 units, 1d. per unit; from 25,000 to 50,000 units, ¾d. per unit; above 50,000 units, ½d. per unit.

PERTH: *Sunday Trams.*—A motion to inaugurate a service of trams on Sunday was defeated by one vote at the monthly meeting of the Town Council last week.

PORTSMOUTH: *Tramways Extensions.*—The Corporation have given notice of their intention to deposit a Bill for the construction of additional tramways.

QUARRY BANK: *Proposed Light Railway.*—Owing to the suspension of the negotiations between the Joint Light Railways Committee, composed of representatives of Quarry Bank, Brierley Hill, and Rowley Regis, and Mr. Vesey Brown's company for the construction of a light railway between Cradley Heath and Brierley Hill, it is proposed that joint conferences should be held between the parties named to decide their course of procedure.

RAWTENSTALL: *Tramways and Lighting.*—In addressing the Town Council last week, the new Mayor stated that the cost of the tramways would be £134,000, and the electricity undertaking, £33,800. These figures indicate, to his mind, that it would be some time before the tramway scheme would be self-supporting, not to say a source of profit, and it was desirable that they should see results from their present undertakings before entering upon any new schemes which were not unavoidable.

RHYL: *Tramways.*—The Council have approved the light railway scheme between Rhyl and Prestatyn, which has been placed before them by Mr. Stephen Sellon, chairman of the Llandudno and District Electric Tramway Co.

SHEFFIELD: *Chairman of Tramways Committee.*—At the first meeting of the new City Council, Sir W. Clegg was again re-elected as Chairman of the Tramways Committee.

SHREWSBURY: *Electricity Supply.*—Notice is given by the Corporation of its intention to promote a General Powers Bill in Parliament next session. Included in the provision of the Bill are the supply and fixing of electrical fittings, wiring of houses, &c., the stand-by clause. The Corporation also seeks authority to allow of discount on rebates of electric lighting and power accounts, and to enter into agreements for the supply of electrical energy in bulk to surrounding districts.

SOUTH SHIELDS: *Lighting and Tramway Undertaking.*—In his annual abstract of accounts, the borough accountant points out that the capital expenditure upon the electric lighting undertaking amounts to £177,438. The net profit for the past year amounted to £1,368, which has been carried to the reserve fund, the latter now standing at £8,782. The capital expenditure upon the tramways undertaking amounts to £169,390. The net profit for the past year amounted to £2,884, which has been transferred to the reserve fund, bringing this to £5,454.

TASMANIA: *Launceston Tramways.*—The *Australian Mining Standard* states that the proposal to instal electric tramways at Launceston makes no headway, and to all appearances the city is as far as ever from the attainment of what all seem to be agreed upon as a desideratum. The scheme was submitted to a London tramways group, by which the Council should issue debentures and cover the cost of construction, the concessionaires then proceeding with the work and being responsible for the commercial risks. This did not quite meet with the views of the tramway group in question, but it is anticipated that further proposals will be placed before the Council.

TONBRIDGE: *Electricity Loan.*—A loan for electric lighting purposes has been taken up from the Newcastle Savings Bank at 3¾ per cent.

TYNEMOUTH: *The Electric Light Works.*—The Corporation have retained Messrs. Handcock & Dykes to report on the condition and management of the electric light station, and on the charges for lighting and power.

Digitized by Google

WALKDEN: *Power Supply.*—Messrs. Edward Lane & Sons, cotton goods manufacturers, of Hope Mills, Walkden near Manchester have now arranged with the District Council for obtaining current for their mills, from the Lancashire Electric Power Co.

WELLINGTON (N.Z.): *Tramways.*—The total revenue from these lines for the past financial year was £122,194, and the working expenses £80,822. Interest on loans, depreciation at 2¾ per cent., absorbed £12,376, leaving £10,229. The net balance after providing for a 1 per cent. sinking fund is £5,568.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ARGENTINE.—The Parana municipality is calling for tenders for the equipment of an electric power station.

AUCKLAND (N.Z.).—Tenders will shortly be invited for consumers' services at an estimated cost of £4,800.

CLACTON.—Cable to the estimated value of £300 is to be laid in connection with a supply to the Convalescent Home.

GLASGOW.—The Electricity Committee recommend an application being made to the Secretary for Scotland for his consent to a further loan of £150,000 for electricity purposes. This recommendation is based upon the report of the electrical engineer, to the effect that £56,500 will be required for new buildings and machinery, and £75,840 for mains and meters.

HOUNSLOW.—A Local Government Board inquiry was held last week into the Council's application to borrow further loans, amounting in all to £7,088, including about £3,000 for work already done.

LONDON. *London County Council: Poplar.*—A loan for £22,180 in connection with the electric lighting undertaking has been completed.

Woolwich.—Owing to the increased load, principally due to the tramway supply, it has become necessary to construct a cooling pond at Plumstead works.

PORTUGAL.—The *Diario do Governo* of October 31st contains a copy of a decree authorising the Camara Municipal of Horta to grant an exclusive concession to Joao Raposo de Medeiros for the production and distribution of electric energy for public and private lighting purposes in the town.

RADCLIFFE.—A Local Government Board inquiry was held last week at Radcliffe (Lancs.) into the local District Council's application to borrow £14,000 for the extension of their electricity works.

ROSCREA.—The Council invite offers from electrical engineers, and others interested, for the preparation of plans, specifications, detailed estimates, and report for an electric lighting installation. Particulars from the Clerk to the Council.

SURBITON.—The Parliamentary Committee has received a letter from the Local Government Board relating to the inquiry held some time ago into the Council's application for borrowing powers to enable them to extend the electric lighting undertaking. The Board state that they have decided to sanction the borrowing of the following sums for purposes of the undertaking, viz. :—£1,377 in respect of excess expenditure; £2,000 for prospective expenditure on mains; £900 on house services; £676 on meters.

WOLVERHAMPTON.—A Local Government Board inquiry was held last week into an application by the Corporation for sanction to borrow £6,000 in connection with the electricity undertaking.

YARMOUTH.—A loan of £2,000 is to be applied for in connection with public lighting mains.

Miscellaneous

DUBLIN UNITED TRAMWAYS CO.—Tenders are invited for stores, including electrical supplies, during the year ending December 31st, 1909. Particulars from the Secretary, and tenders by November 30th.

LONDON: *London County Council.*—Tenders are invited for the road-work and platelaying required for the electrification on the conduit system of the existing tramways from Prince of Wales' Road *via* Kentish Town Road, Fortress Road, and Junction Road to the Archway Tavern. Particulars from the Engineer (fee, £5, returnable), and tenders to the Clerk by November 24th.

Hackney.—The Borough Council invite tenders for meters of the ampere-hour motor type. Particulars from the Town Clerk (fee £5, returnable), and tenders to the Chairman of the Electricity Committee, by December 17th.

MANCHESTER.—The Tramways Committee invite tenders for the supply of tramcar trucks and tramcar resistances (grid type). Particulars from the General Manager, and tenders to the Chairman of the Tramways Committee, by December 1st.

NORTH-EASTERN RAILWAY.—Tenders are invited by December 3rd, for telegraph apparatus and telegraph wire and line stores during the six or twelve months from January 1st, 1909. Particulars from the Telegraph Superintendent, York.

PERU.—*El Diario* of October 1st states that Senador Zegarra has introduced into the House of Senators a proposal for the electrification of the Central Railway of Peru for the purpose of increasing the traffic capacity and facilitating the exportation of minerals. By the terms of the proposal it is intended to continue the use of the existing rolling-stock by running electric trains and steam trains alternately.

REDDITCH.—The Electricity Supply Committee invite tenders by November 24th, for street work in connection with the laying of cables, mains, and house services.

SHEFFIELD.—The Electric Lighting Committee invite schemes and estimates for supplying and erecting complete an automatic or electric railway, telpherage, or wire rope-way for conveying and tipping boiler refuse on the tip adjoining the power station at Neepsend. Particulars from the General Manager and Engineer (fee, £1, returnable), and tenders by December 11th.

SPAIN (CANARY ISLANDS).—The *Gaceta de Madrid* of November 8th publishes a notice to the effect that D. German de Leon y Castillo has applied to the Ministerio de Fomento, Madrid, for a concession for an electric tramway from Las Palmas to the port of La Luz. The Ministerio are prepared to consider other offers on terms more advantageous to the Government if such offers are presented within one month from the date of publication of the present notice in the *Gaceta.*

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.C.—Building in Little Britain (to exceed 250,000 cubic feet). Architect, G. Vickery, 50 Gresham Street, E.C.

S.E.—New factory for Sir W. P. Hartley, Green Walk, Tower Bridge Road, Bermondsey.

Printing works, Southwark. Architect, G. F. Collinson, 81 Hallam Street, Portland Place, W.

Extension of laundry at Gordon Road Workhouse, Camberwell (estimated cost, £800). C. S. Stevens, Clerk to the Board of Guardians, Peckham Road, S.E.

Police station at Carter Street, Walworth (£13,800). J. Dixon Butler, Surveyor to Metropolitan Police, New Scotland Yard, S.W.

S.W.—Additions to Anglo-American Laundry, Tooting. Architects, S. J. Reynolds and H. Hicks, Reigate. Builders, Holliday & Greenwood, Brixton Road, S.W.

Alterations and additions to St. Leonards Girls' and Infants' Schools, Mitcham Lane, Streatham. Builders, J. H. Jenkin & Co., 36 Mitchan Lane, Streatham.

Additions to Convent of St. Andrew, Coventry Hall, Polworth Road, Streatham. Architect, E. Goldie, 31 Upper Phillimore Place, Kensington, W.

Hall, High Street, Tooting. Builders, H. Roffey & Sons, 26 and 28 Charlwood Road, Putney, S.W.

New premises in Queen Anne's Gate for Anglo-American Oil Co. Architects, Runtz & Ford, 10 Walbrook, E.C.

W.—Additions to Workhouse, Paddington. H. F. Aveling, Clerk to the Board of Guardians.

PROVINCES.

BAGTHORPE (NOTTS).—Extension to new Workhouse (£6,500) for Nottingham Board of Guardians. Clerk to the Guardians.

BARNES.—Additions, Lawn Convent Schools, Church Road. Mother Superior.

BROUGHTON-CUM-BOSSINGTON.—School (£3,008). H. Barber, Clerk to County Council, Winchester.

CHISWICK.—Additions to Royal Standard Laundry (£4,500). Architects, S. J. Reynolds and H. Hicks, Reigate and Broadstairs. Builders, Holliday & Greenwood, Brixton.

CRESWELL (NOTTINGHAMSHIRE).—School. H. H. Copnall, Clerk to County Council, Nottingham.

DERBY.—Improvements to slaughter-houses at cattle market. J. Ward, Surveyor to Corporation.

DUDLEY.—Primitive Methodist Church (£2,000). Rev. J. Shenton, Vicar Street.

DUMFRIES.—Joint Fever Hospital (£6,000) for Dumfries and Maxwelltown Town Councils. Clerk to Dumfries Town Council.

FOLKESTONE.—Enlargements at Victoria Hospital (over £2,000).

HAMPSHIRE.—Fareham Asylum Visiting Committee has decided to extend the electric lighting of the institution. Tenders are to be invited for wiring the remainder of the buildings.

HULL.—Art Gallery, Victoria Square (£10,889). Builder, G. H. Panton, 206 Anlaby Road.

Digitized by Google

NORTHAMPTONSHIRE.—Isolation Hospital at Berrywood Asylum. H. A. Millington, Clerk, County Council.

PLYMOUTH.—Horse slaughter-house at Prince's Rock (£593). Builders, Wakeham Bros., Fairy Building Yard, Knighton Road, Plymouth.

PRESTON CIRCUS (BRIGHTON).—Proposed police station. Surveyor, Alf. Weller, Town Council, Brighton.

READING.—New Hall, St. Luke's, Redlands (£1,400–£1,500). Architect, S. Slingsby Stallwood, 27 Market Place, Reading.

SOUTHAMPTON.—Additions to Asenpart School (£12,196). J. A. Crowther, Borough Engineer and Surveyor.

Additions, Western District School (£8,250). J. A. Crowther, Borough Engineer and Surveyor.

ST. ANNE'S-ON-THE-SEA.—Extensions, Technical School (£1,200). Surveyor, H. Gregson, Urban District Council.

TYNEMOUTH.—Extension of North Shields fish quay (£21,000). J. F. Smillie, Surveyor to Town Council.

WEMBLEY.—Police station (£5,200). J. Dixon Butler, Surveyor to Metropolitan Police, New Scotland Yard, S.W.

WEST BROMWICH. Dust destructor (£11,000). A. D. Greatorex, Surveyor to Town Council.

WINCHESTER.—Proposed Asylum at Park Pewett Farm (500 places). H. Barber, Clerk to County Council, Winchester.

TENDERS RECEIVED AND ACCEPTED

BAHIA BLANCA.—In connection with the new power station at Bahia Blanca of the Buenos Aires & Pacific Railway, Messrs. Browett Lindley are supplying, as sub-contractors to the British Westinghouse Co., three triple-expansion engines for coupling to 1,000-kw. generators.

CORY BROS.' COLLIERIES.—Messrs. Crompton & Co. have received an order from Messrs. Cory Bros. & Co., Ltd., for an alternator with an output of 650 k.v.a. 2,200 volts 25 cycles, 107 revs. per min. This alternator will be a duplicate of the one now being installed by Messrs. Crompton at Messrs. Cory Bros.' Aber Colliery, and will be driven by the large Korting gas engine, manufactured and shown by Messrs. Mather and Platt, at the Franco-British Exhibition. Messrs. Crompton have also supplied two three-phase high-voltage motors for driving the main haulage. The motors have each an output of 270 b.h.p., and run at a speed of 360 r.p.m.

LEITH.—The following tenders have been accepted in connection with the Granton tramway extension:—Rails, North-Eastern Steel Co., Ltd.; joint welding, Thermit, Ltd.; cables, British Insulated & Helsby Cables, Ltd.

LONDON: *London County Council.*—The following tenders have been received for the roadwork and plate-laying, exclusive of the supply of rails and track work, in connection with the reconstruction upon the conduit system of the existing tramways in Essex Road, King's Cross, and Farringdon Street, and of the authorised tramways in Swinton Street:—Mr. W. Manders (accepted), £43,534; Dick, Kerr & Co., Ltd., £44,038; J. Mowlem and Co., Ltd., £44,856.

The following tenders have been received for the supply of overhead electrical equipment required for the tramways from Loughborough Junction to Norwood, Hammersmith to Putney, and Streatham to Norbury:—R. W. Blackwell & Co. (accepted), £7,801; British Insulated & Helsby Cables, Ltd., £8,229; Dick, Kerr & Co., Ltd., £8,266; S. G. Smith, £9,167; Reid Bros., £11,171. The Highways Committee recommend that arrangements be made with the undermentioned firms for the extension of their present contracts with the Council, to include the supply of the additional materials required for tramway work to be put in hand during 1908-9:—W. T. Henley's Telegraph Works Co., Ltd., low-tension cables; J. H. Tucker, feeder pillars; Johnson & Phillips, switchgear; the British Westinghouse Electric & Manufacturing Co., Ltd., motor generators.

The following tenders have been received for water-tube boilers for the second portion of the Greenwich generating station:—Edwin Danks & Co. (Oldbury), Ltd., £25,115; Clarke, Chapman & Co., Ltd., £25,875; Babcock & Wilcox, Ltd. (accepted), £27,526; Stirling Boiler Co., Ltd., £27,833; Richardsons, Westgarth & Co., Ltd., £39,262.

In connection with the construction of the overhead trolley tramways from Hammersmith Broadway to Putney, the County Council has come to an agreement with the Hammersmith Borough Council as to the positions of the tramway standards and the erection of electric lamps. The Borough Council will remove the arc lamps in Fulham Palace Road and substitute metal filament lamps, two of which will be affixed to each of the tramway standards. The cost of this will be borne by the County Council.

Bermondsey.—The Council has received the following tenders:—Three inkless recording voltmeters, moving-coil type, direct-current 450 to 525-volts seven-day clock, continuous roll chart (⅛in. per hour), front terminals:—Kelvin & James White, £33 15s.; Evershed & Vignoles, £32; General Electric Co., £27 4s. 6d.; Elliott Bros., £27 7s. 6d.; Everett, Edgcumbe & Co., £35 4s. 9d., alternative (accepted), £25 12s. 6d.; less 2½ per cent.

Three feeder pillars, each fitted with six 200-amp. switch fuses of standard type and bar for connecting neutrals, mounted on three separate panels, with doors back and front fitted with lock and key:—Callender's Cable Co., £46 10s.; Johnson & Phillips, Ltd. (accepted), £43 10s.; Crompton & Co., £46 5s.

One hundred feet 0·7 square inch single cable, insulated with pure and vulcanised rubber, Association 300 megohm grade, taped, braided, and compounded over all:—Siemens Bros. & Co., Ltd., £31 7s. 5d.; Johnson & Phillips, Ltd., £31 17s. 5d.; Callender's Cable & Construction Co., Ltd. (accepted), £31 17s. 6d.; British Insulated & Helsby Cables, Ltd., £31 17s. 6d.; W. T. Henley's Telegraph Works Co., Ltd., £33 13s. 2d.; 2½ per cent. less in each case.

Marylebone.—The tender of Messrs. W. J. Fryer & Co., at £4,426, has been provisionally accepted by the Electric Supply Committee for alterations at the Aybrook Street sub-station. Messrs. Sykes and Sugden's tender has been accepted for cut-outs, concentric 0·03 and 0·06, 7s. each, and triple concentric 0·1 and 0·15, 15s. each; and that of Lucy & Co., Ltd., for triple concentric cut-outs 0·03, 14s. 3d., 0·06, 14s. 6d., 0·25, 27s., and 0·4, 80s. each. Joint boxes concentric 0·4-5, 1 square inch, £1 12s. 9d. each; triple concentric 0·4, £1 3s. 8d.; disconnection boxes, Council's pattern or stock (four-way), £6 5s.; extra for 0·4 triple concentric, 6s. 9d.

Stepney.—An order has been placed with the Tudor Accumulator Co., Ltd., to substitute a battery with 250 cells for the old station electrical battery at a cost, including allowances for scrap, of £342.

Woolwich.—The Council have accepted the tender of Siemens Bros. & Co., Ltd., at £36 15s. for 220 yards of service cable, consisting of 0·035 and 0·022 square-inch section conductors.

WADEBRIDGE.—Tenders have been received from the Wadebridge & District Electric Supply Co., and from the Wadebridge Gas Co., for the replacement of the oil lamps which are now used for street lighting. The tender of the Electric Supply Co. has been accepted.

COMPANIES' MEETINGS AND REPORTS

BRITISH COLUMBIA ELECTRIC RAILWAY CO.—At the annual meeting on Thursday, the report and accounts given in our last issue were adopted. The chairman, Mr. R. M. Horne-Payne, in moving the adoption of the report, stated that the directors did not know of a single cloud in the outlook, and that every indication pointed to increasing trade and prosperity for British Columbia and for the company. There was only one item in the balance sheet, he said, that required explanation, and that was under the heading "supplies." The large increase in the value of supplies on hand was due entirely to the fact that the company availed themselves in the spring of the panic prices of copper, steel, and other supplies to make purchases in advance for some 18 months or two years. A very pleasant and important feature in the report, he said, was the paragraph which refers to the concession granted to the company to carry on their business for a longer period of years in almost all the municipalities adjacent to Vancouver and New Westminster. The Hon. R. G. Tatlow, Minister of Finance and Agriculture for British Columbia, explained the conditions now prevailing there, and the possibilities of the future. After the resolution adopting the report and accounts had been carried, a further resolution was passed, authorising an increase of the capital of the company by an issue of 300,000 new shares of £1 each.

CAPE ELECTRIC TRAMWAYS CO.—At the annual meeting last week, the report and accounts given in our issue for November 5th were adopted. The chairman, Sir Charles Euan-Smith, who presided, again made reference to the competition of the Sea Point municipality with the company's service. With regard to the general commercial and financial depressions, he was convinced that this was only temporary, for the gold industry was more prosperous than ever, and this must react favourably on the general conditions of trade throughout the country.

EASTERN TELEGRAPH CO.—At the half-yearly meeting last week, Sir John Wolfe Barry, K.C.B., presiding, the report and accounts given in our issue for November 5th were adopted. Dealing with Mr. Henniker Heaton's suggestion of penny-a-word cables all over the world, the chairman referred to the statement of a very powerful committee who reported in 1902

Digitized by Google

upon the whole subject of submarine cables. This committee consisted of the Secretary of State for Scotland, the Postmaster-General, the President of the Board of Agriculture, the Under Secretary of State for the Colonies, the Director of Military Intelligence, and the Director of Naval Intelligence. This committee were directed "to examine existing rates; to report how far they are fair and reasonable; and, if not, how any reduction should be effected." Upon this reference, Sir J. Wolfe Barry pointed out, the committee replied that all proposals for a very large reduction in existing rates, such as Mr. Henniker Heaton suggested of 1d. rate to America and Australia, were regarded as quite impracticable. There was, he said, little analogy between submarine cables and the 1d. post. In reply to a question as to the future of wireless telegraphy, Sir John stated that he had always refused to pledge himself to any opinion on this matter. From his knowledge, however, he did not see that wireless telegraphy was going to be a material competitor with cable telegraphy. It was a very beautiful, ingenious, and captivating mode of telegraphy, but he did not think it possessed, and never would possess, the advantages of cable telegraphy. As a matter of fact, the Eastern Co. were putting up a wireless installation in conjunction with one of the foreign Governments to act as a feeder to their general system, and if the time came for wireless telegraphy to be used by the cable companies on a larger scale, none of them would be backward in keeping abreast of scientific improvements.

LANCASHIRE & DISTRICT TRAMWAYS.—At the annual meeting in Lancashire on Saturday, the report and accounts given in our issue for November 12th were adopted.

LANCASHIRE POWER CONSTRUCTION CO.—At an extraordinary general meeting, held in London last week, the resolution sanctioning the creation of income debenture stock to the extent of £150,000 was carried. An amendment was moved to the resolution, urging that the business should be sold as a going concern in order that the "A" shareholders might get a little of their money back. This was defeated, however, and the resolution passed as mentioned above.

MEXICAN LIGHT & POWER CO.—The revenue statement for October shows that the working expenses have been reduced to 24½ per cent., as against 38 per cent. twelve months ago, and the net earnings are now equivalent to 7 per cent. on the common stock, the present dividend being at the rate of 4 per cent. per annum. The earnings for October amount to $519,651, an increase of $68,555 for the corresponding period of last year, whilst the expenses amount to $126,966, a decrease of $47,389. The fixed charges amount to $20,800, an increase of $48,000, leaving a surplus of $184,685, an increase of $67,944 over the corresponding period of last year.

MONTREAL STREET RAILWAY CO.—The report for the year ended September 30th shows that the gross earnings have increased by $173,789, or 4·96 per cent., and the operating expenses by $53,741, or 2·55 per cent. The net earnings have increased by $120,048, or 8·58 per cent. This result the directors considered very satisfactory in view of the general depression in business, and further satisfaction is expressed at the reduction in the percentage of expenses to gross earnings from 60·07 per cent. to 58·69 per cent. To some extent these results are attributed to the fact that the principal lines of the system are now equipped with "pay as you enter" cars. The directors issued to the shareholders in July last $1,000,000 new stock at 125.

WESTERN TELEGRAPH CO.—Sir John Wolfe Barry, K.C.B., presided at the half-yearly meeting last week, when the report and accounts given in our issue for November 5th were adopted.

WEST INDIA & PANAMA TELEGRAPH CO.—The report for the half-year ended June 30th shows a revenue of £39,733, compared with £43,832 for the corresponding period of last year, whilst the expenditure amounts to £27,560, against £30,028. To the balance is added £1,578 interest on investments, and £557 brought forward from last account, making a total of £14,302. It is proposed to pay a dividend of 6s. per share for six months to June 30th on the first preference shares, and 12s. per share on account of dividends accrued to June 30th upon the second preference shares, carrying forward a balance of £11,032. Owing to the difficulty of maintaining uninterrupted cable communications between Demerara and Trinidad, owing to the unfavourable nature of the seabed, the directors have decided to establish wireless telegraphy as an additional means of communication. A contract has accordingly been entered into with the Lodge-Muirhead Wireless & General Telegraphy Syndicate, Ltd., for the installation of the necessary apparatus in Demerara and Trinidad.

Telegraph Traffic.—The El Arich route was interrupted between Antiodre and Lattaqine on the 15th inst., and on the 11th inst. the submarine cable between Zanzibar and Mombassa, which was interrupted on September 11th, was restored to working order. There may be, of course, many interruptions which are not known of, as if there are duplicate lines working such incidents are not reported.

RECONSTRUCTION OF THE STREET RAILWAYS OF SAN FRANCISCO

AN article in the *Electric Railway Journal* on the street railway system of San Francisco contains some interesting information regarding the reconstruction of the lines after the earthquake and fire of 1905. Just prior to the earthquake there were in all some 153 miles of tramway route, comprising 288 miles of track, of which 260 were owned by the United Railroads Co. of San Francisco, and the remainder by the smaller companies. Of the total track mileage 205 were equipped for electric traction and 77 for cable, while horse traction was used on about five miles, and on rather over one mile steam was employed.

The electrical equipment of a large proportion of the cable lines had been decided upon before the earthquake, but the change was accelerated by the disaster, as all except the smallest of the cable power stations were practically destroyed. The damage done to the tracks is well known; it was due partly to the earthquake, for in some places the surface of the street dropped about 6 ft., and partly to warping of the rails by the fire which followed. Some of the car-sheds were burned down, but the United Railroads Co. only lost seven of their 455 electric cars, although 75 of the 423 cable cars belonging to this company were destroyed. All the electric power stations were outside the fire area, but they were to some extent damaged by earthquake.

Immediately after the fire the only feasible method for quickly restoring service was by the introduction of the overhead trolley system, and powers were granted for the substitution of electric power on all the cable lines.

During the year following the earthquake, the United Railroads reconstructed approximately 35 miles of single track and laid in the neighbourhood of 100 sets of special work, the greater portion of the latter being built up in the company's own shops. This work was accomplished under exceedingly adverse conditions, among which may be mentioned the bad conditions of the streets, high wages and the inefficiency of labourers, strikes and the high price and scarcity of building materials of all kinds. The greater portion of the reconstruction consisted of cable lines converted to electric, and had been planned by the company prior to the earthquake. This work proved much more difficult and expensive than the construction of entirely new electric lines.

Various methods of reconstruction were adopted on the different lines, differing mainly in the manner of disposing of the yokes on which the cable tracks were supported. Some of these were adopted temporarily owing to the exigencies of the situation. Thus, on McAllister Street, an attempt was made to run the electric cars over the old cable tracks, but it was found that the flanges of the wheels on the electric cars would bear on the inner portion of the rail head, before the tread would bear on the outside portion of the head. Therefore, the inside portion of the head was sheared off by hand. Under these conditions the track gave moderate satisfaction until the spring of 1907, when standard reconstruction was begun.

The method of reconstruction adopted in some cases, such as in Sutter Street, was to leave the yokes and structures of the original cable construction in place, merely cutting away enough so that the ties, rails, and pavement could be put in position. This was found necessary on account of the weakness of the yoke, which would tear in pieces instead of pulling out intact.

The yokes on some other streets, such as Hayes Street, were made up of bent rails, and were so strong that they had to be pulled out from the concrete bed intact. This was done by means of a crane car. First a length of rail was attached to the yoke in such a manner that, combined with the yoke, it acted as a lever. The crane pulling on this lever broke up the concrete substructure to such an extent that the yoke could readily be pulled out and thrown aside. A method of drawing the yokes by means of hydraulic jacks was also tried, but was abandoned in favour of the crane system.

The same general type of roadbed was adopted for the entire city and was used on all reconstruction, modified only by the existing yokes and substructures. The sections in the figure on page 684 show the standard construction, and also methods of treating the yokes which were used.

The substructure is a combination of ties and concrete stringers, resting on 6 in. or 8 in. of broken stone or broken concrete ballast. In most cases this broken concrete consisted of the original substructures broken on the ground by means of a portable electric crusher mounted on an old flat car. This ballast is brought up flush with the bottom of the ties. The ties are spaced 2 ft. 6 in. apart, and between the ties and under each rail is a mass of concrete 6 in. thick, which forms

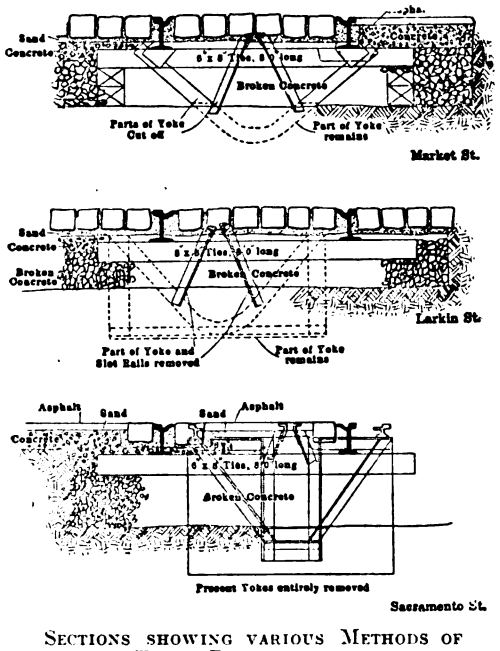
Digitized by Google

a monolith with the floor of concrete which covers the ties and supports the pavement. There are two types of paving between rails, one consisting of Belgian blocks and the other being an asphalt surface with a toothing of alternate 5-in. and 8-in. blocks inside each rail.

The rails used vary in weight on the different parts of the lines from 141 lb. per yard to 109 lb. per yard.

One of the smaller companies has been able to repair its cable line, but another decided to reconstruct as an electric line, taking power from the United Railroads Co. One of the lines of the United Co. which contains very steep gradients has been rebuilt as a cable tramway.

The largest of the steam-driven power stations of the company is of interest on account of the boilers being fired by California crude oil, obtained through an 8-in. pipe, 8,000 ft.



SECTIONS SHOWING VARIOUS METHODS OF TRACK RECONSTRUCTION.

long, from the storage tanks of the Associated Oil Co. An auxiliary 5-in. oil main runs from the docks, so that oil can be pumped into the station tanks direct from barges if necessary.

One pound of the oil used contains about 18,500 B.Th.U., and will evaporate 14·8 lb. of water from and at 212° Fahr. The oil consumption is at the rate of 0·28 gal., or 2·24 lb. per kw.-hour, which equals 1·68 lb. per h.p.-hour. The corresponding coal consumption would be 3·52 lb. per kw.-hour, with a boiler efficiency of 78 per cent. and a grade of coal giving an evaporation of 9 lb. of water, from and at 212° Fahr., per pound of coal. Provision was made in the boiler foundations for ash pits, &c., for burning coal, but up to date the price of oil has been such that it proved more economical than coal.

The greater part of the power is, however, derived from the hydraulic stations of the California Gas and Electric Corporation.

MISCELLANEOUS CITY NOTES

ANCHOR CABLE CO.—Applications are being invited for an issue of £50,000 4½ per cent. debenture stock at par.

DORMAN, LONG & CO.—A final dividend of 4 per cent., free of income tax, making, with the interim dividend already paid, 6½ per cent. for the year, is recommended.

GENERAL ELECTRIC SUPPLY CO.—The 4 per cent. guaranteed debenture stock transfer books will be closed from November 17th to 30th inclusive, preparatory to the payment of interest due on December 1st.

METROPOLITAN AMALGAMATED RAILWAY CARRIAGE & WAGON CO.—A dividend on the ordinary shares at the rate of 7½ per cent. per annum, free of income tax, has been declared for the half-year to September 30th.

RICHARDSON, WESTGARTH & CO.—It is announced that no dividend will be paid to the shareholders for the current year, owing to the prolonged strike in the engineering trade. Twelve months ago a dividend of 4 per cent. was paid upon the ordinary shares, and for several years previously the dividend of 6 per cent. was paid.

CORRESPONDENCE

25-VOLT TRANSFORMERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Referring to Mr. A. H. Dykes' article in your issue of October 29th, I would say that his remarks comparing balancers, autos, and double-winding transformers for use with metal filament lamps need some modification from the transformer point of view, especially as the balancing transformer should be considerably smaller and have smaller losses than given in his article. In the following table I therefore give a comparison between the figures given by Mr. Dykes for a 1,000 watt total output at a primary voltage of 200 and a secondary of 25 (all assumed to be 50 periods), and the figures obtained, for instance, by the British Westinghouse Electric & Manufacturing Co.'s transformers on standard frames, with the rating so adjusted as to give exactly 1,000 watts for all three cases.

	Balancer, 200/8×25 v.			Auto, 200/25 v.				Double wdg., 200-25 v.			
	List price.	Iron loss.	Total loss.	List price.	Iron loss.	Total loss.	Regulation.	List price.	Iron loss.	Total loss.	Regulation
Dykes ...	65s.	19	29	73s.	21	47	3·75	81s.	24	54	4·25
Westinghouse..	41·6s.	7	17	88s.	13	39	2·6	92s.	14	50	3·70

The balancer is so arranged that each circuit can take 125 watts at 25 volts, and can be switched on or off quite independent of any of the other circuits. It will thus be seen that the figures given by Mr. Dykes considerably under-state the gain obtained if it is possible to arrange the wiring so that balancer transformers can be used.

I would further point out that where a double-winding transformer is used, no improvement can be obtained either in cost or in efficiency of the transformer by using a three-wire system for 2×25 volts instead of a 25-volt system, the three-wire transformer, as a rule, being slightly more expensive, due to the extra lead required. On the other hand, I heartily agree with Mr. Dykes that a saving in the wiring may be obtained by the use of a transformer for 2×25 volts, and that where such simplified wiring, as proposed by him, can be arranged, it is usually justified to use a double-winding transformer instead of an auto-transformer. Wherever such simplified wiring cannot be adopted, however, a great saving may be made by using balancer transformers.

Yours faithfully,

K. FAYE-HANSEN.

British Westinghouse Works, Trafford Park, Manchester.
November 17th, 1908.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, quoted on Tuesday night, net c.i.f. port of arrival, was £66 10s. to £67 per ton (last week £66 10s. to £67 5s.).

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—The Sevenoaks Motor & Electric Co., Ltd., is to be wound up voluntarily. Mr. A. P. Guerrier, of 126 Gresham House, London, E.C., has been appointed liquidator. A meeting of creditors will be held at the above address on November 25th, at 3 p.m.

A meeting in the bankruptcy of Percy F. Letts, electrician, The Arcade, Northampton, was held last week, when a statement of affairs was submitted showing liabilities to unsecured creditors amounting to £117 18s. 11d. After allowing £4 for preference claims, the assets were expected to produce £86 1s. 2d., or a deficiency of £31 17s. 9d. The following are creditors:—General Electric Co., £11; Berry, Skinner & Co., £11; A. Berkeley, £12; Baxendale & Co., £53.

The trustee in the bankruptcy of C. H. Vere, electrical engineer, 5 Park Parade, North Finchley, has been released.

The trustee in the bankruptcy of F. B. Egginton, electrical engineer and contractor, 11 Tempest Street, Wolverhampton, has been released.

CORDOBA LIGHT POWER & TRACTION CO.—The *Stock Exchange Gazette* states that a debenture issue of some importance will shortly be available.

SIMPLEX CONDUITS.—The Newcastle offices and showrooms of the Simplex Conduits, Ltd., were officially opened on Thursday, when a large party of electrical users and others were received by Mr. L. M. Waterhouse, managing director. In the evening a dinner and concert was held at Tillies' Restaurant to celebrate the opening of this new branch.

THE LONDON ELECTROBUS COMPANY

THE directors have decided to close the company's financial year on October 15th. The balance-sheet and profit and loss account is being prepared, and will be submitted to the shareholders at the annual general meeting to be held in December. In the meantime a statement has been issued showing the working of the company's omnibuses from July 15th, 1907 (when the service was commenced), until October 15th of this year. Over the whole period, as certified by the company's auditors, the average takings of the 'buses have been 14d. per 'bus mile, a result which the directors believe to be without precedent in London 'bus traffic experience. The total number of passengers carried up to date on the company's 'buses is nearly 3,000,000. and the statement referred to above includes some figures comparing the results of the company with those of the London General Omnibus Co. and the London tramways. This shows that the London Electrobus Co.'s vehicles have an average seating capacity of 34; and that during the 15 months from July 15th, 1907, to October 15th, 1908, the number of passengers carried per vehicle mile have been 10·75, and the average takings per vehicle mile 14d. The respective figures for the London General Omnibus Co. for the year ending June 30th, 1908, taken from the company's 49th report, were 30, 6, and 8, and for the London trams, 60, 10·35, and 1d·13. These latter figures, were taken from *The Tramway and Light Railway Journal*. With regard to battery maintenance, with the exception of a few experimental batteries, all the battery maintenance has been done under contract at 2d. per 'bus mile, and the directors have offers to maintain 100 electrobuses at the same rate for three years. From the certificate of the auditors, it appears that the earnings of the 'buses during the first twelve months only exceeded the operating expenses by £743, which was not sufficient to pay the establishment and overhead expenses of the company. For the last three months, however, the earnings have exceeded the operating expenses by £1,526, which has just about been sufficient to meet the establishment and overhead expenses. These expenses are about £6,000 per annum, and it is pointed out that they would not be materially increased if the company's fleet of 'buses were doubled. An estimate is given, based upon the present rate of profit, namely, £448 per 'bus per annum, showing that with a fleet of 80 'buses there would be available for dividend on ordinary and deferred shares a sum of £12,851 after meeting establishment and overhead charges, debenture interest, and provision for depreciation and amortisation of debentures. Having considered the whole position and consulted some of the largest shareholders, the directors have decided to raise the capital necessary to increase the fleet, by way of debentures (exchangeable for ordinary shares), and to offer these debentures in the first instance to the shareholders. For this purpose £50,000 of first mortgage 6 per cent. debenture stock have been created, exchangeable during three years for ordinary shares, and if not exchanged is repayable on December 31st, 1919, at £110 per cent.

AN AMERICAN THREE-PHASE LOCOMOTIVE

SOME time ago the interesting announcement was made that three-phase traction was to be adopted by the Great Northern Railroad of America through the Cataract Tunnel. According to the *Electrical World* (New York) the first of the four locomotives which the American General Electric Company will supply has been completed, and is now being subjected to exhaustive tests under service conditions. Although a liberal air-gap of ¼ in. has been allowed, the power factor remains above 80 per cent. throughout the whole operating range and reaches a maximum of 86 per cent. The maximum torque is at least three times the guaranteed full-load running torque. It is noteworthy, moreover, that the motors, being of the three-phase induction type with secondary rheostatic control, are capable of exerting this torque at any speed from standstill to within a few per cent. of synchronism.

The locomotive is of the double-truck type, and there are two motors per truck. The total weight is 230,000 lb., all of which is on the drivers. The over-all length is 45 ft., and the rigid wheel-base is 11 ft. The wheels are 60 in. in diameter.

The rotor of each motor is mounted on a shaft geared at both ends to one axle of the locomotive. The gear ratio is 1-to-4·28. The motors are wound for eight poles, and when operated at 25 cycles have a synchronous speed of 375 r.p.m. The rotors are equipped with slip rings. In order to obtain the maximum of simplicity no effort has been made to operate the motors in cascade or to use any pole-changing device. It was held that the saving in energy by the introduction of speed-changing schemes was of no importance, because the energy is obtained from a hydro-electric station where there is no storage available, and any saving at the motors will represent merely a saving in water, which would then be allowed to flow over the dam.

In arranging the apparatus and controlling devices within the locomotive the keynote has been simplicity. Step-down transformers, contactors, blowers, air compressors, &c., are placed within a fireproof compartment in the centre of the body of the locomotive, and a wide alley-way is arranged on all four sides of this compartment. The transformers for changing the line pressure of 6,600 volts to 500 volts for use at the motors are of the air-cooled, two-coil type. A negligible saving in constructive material could have been obtained by using auto-transformers for this purpose, but the improved insulation and the reduction in the risk to life by the use of two-coil transformers were considered of predominating importance. The air which is forced through the transformers passes upward through ventilating openings in the top of the locomotive after having passed through the speed-controlling rheostats. The motors also are cooled by the air, which is obtained from a centrifugal blower driven by a three-phase induction motor.

The locomotive is equipped with four wheeled trolleys, two of which will be used for operation in each direction, while the rail will be employed as the third conductor. The normal trolley potential will be 6,000 volts, but it will reach a value of 6,600 volts during starting conditions on account of the fact that Tirrill regulators will be employed at the station for increasing the e.m.f. with increase in load. It is expected that the speed regulation of the driving turbines will not be close, but this condition is looked upon as advantageous rather than disadvantageous. For example, under starting conditions when the load is heaviest the speed will be lowest. The reduction in speed does not involve a decrease in e.m.f., but merely a lowering of the frequency. This change in the frequency will assist the locomotive in starting a train and will cause a shift of the load from other locomotives which may be running at full speed to the locomotive which is accelerating.

One of the advantages of a three-phase locomotive which was considered of much importance in the Great Northern equipment is the tendency to operate at constant speed. The gearing is such as to give to the locomotive a speed of about 15 miles per hour, which will be maintained on the up-grade and will be only slightly exceeded on the down-grade. When the train is going down-grade a certain amount of energy will be returned to the supply system. No importance was placed upon the return of this energy, but the limiting of the maximum speed was considered as of great importance. The tendency to limit the speed will not be affected by the removal of one trolley wheel from contact with the overhead wire.

According to the present plans, the locomotives will be used only through the Cataract Tunnel, which is somewhat less than three miles in length and has a uniform grade in one direction of about 1·7 per cent. However, in event of the satisfactory operation of the locomotive, it is probable that at least the two grades in the immediate neighbourhood of the Cascade Tunnel will be operated electrically in the near future. The consulting engineer for the Great Northern Railroad Company is Dr. Cary T. Hutchinson, under whose supervision the entire installation is being made.

Explosion of a Stop Valve at the Works of the National Electric Supply Co. at Preston.—The Board of Trade Report on the explosion of a stop valve at the works of the National Electric Supply Co., Crown Street, Preston, on Friday, August 21st, has now been issued. From the investigations of the inspector, it appears that the valve which burst, which was of the equilibrium type, 7 in. in diameter, is the main stop valve of an engine which had been out of use for about a week, and that the main stop valve on the main range leaked somewhat, so that a considerable amount of water must have collected in the pipe. These pipes normally drain into an automatic steam trap. In starting any of the engines, however, it is not the custom to depend alone upon the efficient and automatic working of the traps for clearing the steam pipes of water, the invariable rule being to ease the relief valve at the bottom of the trap, by hand, before starting the engine. This work is usually performed by one of the drivers, but in this case was omitted. The cause of the explosion is given in the report as follows :—"The explosion was due to water hammer action, owing to the driver having neglected to drain the water from the pipes previous to starting the engines." No fault is found in the report with the construction of the valve, and the following remarks are made with reference to the draining arrangements :—"The draining arrangements of the pipes may be said to be as complete as is usually found in any well equipped and modern power station, and although the automatic steam trap is fitted, it is merely an adjunct, the standing order being—to clear the steam pipes and receiver of water by hand before starting an engine."

BOARD OF TRADE REPORT ON LONDON TRAFFIC

A REPORT has been issued by Sir Herbert Jekyll, who has charge of the special London traffic branch of the Board of Trade which was constituted last year. The objects of this branch of the Board of Trade are to consider all new schemes of locomotion for which Parliamentary powers are sought, so far as they come within the scope of the Board; the collection of information; and the preparation of annual reports on London traffic to be presented to Parliament. The report now issued is the first of this annual series, and is intended to supplement the report of the Royal Commission on London traffic. A special section relates to means of locomotion, including tramways and railways. It is pointed out that the number of tramcars during the year in the area covered by the report increased from 1,719 to 2,112, those propelled by mechanical power having increased from 576 in 1903 to 1,768 in 1907. The report considers there is an insufficiency of tramways in London, and that the lack of harmony between the working of different systems and the absence of through running, or even of through booking, has been a drawback to making the fullest use of existing means of locomotion. Special reference is then made to the controlling power secured by the Underground Electric Railways Co. of London over certain of the tube railways, and over the District Railway and the London United Tramways, Ltd. It can hardly be doubted, the report states, that an extension of a similar principle of amalgamation to the whole of the electric railways and tramways of London would be attended with still greater benefit. In fact, it is even suggested that the omnibus services might be included in such a scheme so that all the public means of locomotion in London, with the exception of the trunk railways might be brought into one comprehensive system under a single management. The mischievous lengths to which competition has been carried between electric railways, tramways, and omnibuses, have resulted in most of the undertakings being worked at a loss, or at a profit which does not yield a fair return upon the capital outlay. Therefore, it is thought that a scheme of amalgamation and co-ordination would prevent not only the present unprofitable results, but also that overlapping and duplication of services which is a most uneconomical feature of the present system.

Since the report of the Royal Commission on London traffic was presented, it is pointed out that 26½ miles of new tube railways have been opened; 28½ miles of new tramways have been constructed; electric traction has been substituted for steam traction on 68 miles of railway; 80 miles of new electric tramways have been constructed in the outer area; and the northern and southern tramway systems of the London County Council have been linked up, in addition a number of other improvements, such as tunnels under the Thames and street widenings have been completed.

At the end of the report Sir Herbert Jekyll speaks strongly in favour of the formation of a traffic board, which was unanimously recommended by the Royal Commission on London traffic. This question, he says, involves social and economic considerations of great magnitude and intricacy, and a close study of the whole subject tends to support the conclusion that it can only be dealt with effectively by a permanent body giving continuous attention to it.

A large mass of statistical information is contained in Sir Herbert Jekyll's report in the form of appendices, together with a number of plans and maps relating to electric railway and tramway services, as well as to the other aspects of the question.

Interruption of Supply at Leeds.—We have received from Mr. H. Dickinson, the engineer and manager of the Leeds Corporation electric lighting department, the following account of the mishap which caused a slight interruption to the supply on Saturday night. The trouble arose when synchronising a new machine on to the bus-bars. The new machine broke down the moment it was synchronised. This caused the automatic trips on the main switches of the other machines running at the time to operate, and the whole of the supply was shut down. Fresh machines were run up, and within about ten minutes the greater portion of the supply was restored. In about twenty minutes the last circuit was reconnected. The trouble occurred about a quarter past eight, and although considerable inconvenience was caused no serious trouble has been reported.

Finsbury Technical College Old Students' Association.—The third annual dinner of this Association will be held at the Criterion, Piccadilly Circus, London, on December 15th, at 7 for 7.30 p.m. The chair will be taken by Mr. P. V. McMahon, President of the Association. Tickets (5s. each, exclusive of wine) may be obtained from Mr. E. W. Moss, Secretary to the Electrical Section, 20 Huddleston Road, Tufnell Park, London.

CATALOGUES AND PAMPHLETS RECEIVED

ACCUMULATORS.—A pamphlet dealing with the "Exide" accumulator for ignition purposes has been issued by the Chloride Electrical Power Storage Co., Ltd., of Clifton Junction, Manchester. In this pamphlet the ignition capacity has been taken as double that at a continuous discharge at the 10-hour rate, whereas the recommendation of the Society of Motor Manufacturers and Traders is that the capacity be taken at the 20-hour rate of discharge, with an interval of rest after 10 hours. To give a capacity at the 10-hour rate is considerably more severe than at the 20-hour rate with a rest, but for the sake of simplicity it is stated that the capacities given in the list are in accordance with the S.M.M.T. rating, although as a matter of fact they are better. Prices and particulars of 4-volt accumulators of from 20 to 120 ampere-hour capacity are given, and a few 6-volt sets are also listed.

CREOSOTED POLES.—A leaflet from Richard Wade, Sons & Co., Ltd., of Hull, gives a list of the particulars which customers should forward to the company when ordering poles for telegraph or other overhead line work.

ELECTRICAL PLANT & ACCESSORIES.—We have received from the A.E.G. Electrical Co. of South Africa, Ltd., copies of a number of pamphlets published by the foreign department of the Allgemeine Elecktricitäts Gesellschaft. One of these contains a fully illustrated article on "Electric Locomotives for Mines and Iron Works," which contains descriptions of installations carried out by the A.E.G. Other pamphlets deal with joint boxes for use with lead-covered cables and other accessories, open type high-speed continuous-current shunt motors, and enclosed motors. A special pamphlet contains particulars and prices of the W.E. single-phase commutator motors manufactured by the firm for outputs of from 0.5 to 6 h.p. A new pattern of section insulator for tramway systems, and an adjustable cord roller for lamp pendants are also described on separate leaflets.

ELECTRICAL SUPPLIES.—A comprehensive catalogue of electrical fittings, cables, insulators, switchgear, and other accessories has been recently issued by the British Electrical & Manufacturing Co., of St. Nicholas Buildings, Newcastle. The first few pages are devoted to abstracts of the various Home Office and Board of Trade regulations, and a large number of conversion tables, tables showing current capacity of wires, bare and covered, and other useful information is also included. The catalogue proper commences with full particulars of wires and cables; these are followed by a section on insulating materials and insulators. Steel conduits and fittings are listed, and a large variety of water-tight telephone instruments, switches, and other apparatus for use in mines, shipyards, &c., is included. Lamp fittings for use in factories, mines, and for similar industrial purposes are fully listed, and switchgear, including the well-known "Ajax" patterns, is described in the list. The catalogue is profusely illustrated and well arranged.

RESONANCE INSTRUMENTS.—A new pamphlet from Messrs. Isenthal & Co., of 85 Mortimer Street, W., contains particulars of a considerable variety of instruments based on the resonance principle, including frequency meters and tachometers of both the visible vibrating reed pattern and also of a special design with ordinary scale and pointer, worked by a relay system by means of a set of vibrating reeds contained in a separate box. Special instruments for synchronising with several sets of reeds are also included. When used as frequency meters they are actuated by the alternating-current of the system, but they can be used as speed indicators for any kind of machinery by means of a small alternating magneto generator. A special form is made for locomotives. In addition to the ordinary indicating patterns a recording form is made in which the particular reed thrown into vibration is caused to make a mark on a revolving paper drum. The same list contains particulars of a form of revolution counter with cyclometer dial, which can be actuated electrically from a distance.

SPIRAL RIVETED PIPES.—A pamphlet from the American Spiral Pipe Works calls attention to the many different uses to which Taylor's spiral riveted pipes are adapted, and contains a number of views of pipe-lines for various purposes where this form of construction is used. Several methods of jointing pipes of this description are illustrated.

SWITCHGEAR.—A cover is to hand from the Switchgear Co., Ltd. (late J. G. Statter & Co.), of Newhall Street, Birmingham, in which are filed various leaflets relating to the switchgear manufactured by this firm. Reverse current and overload circuit breakers, fitted with the Statter patent time lag attachment, and others with magnetic blow-out arrangements, are described. Other leaflets refer to the Statter time lag relay for alternating-current circuits, oil-break switches, and motor-starting switches.

TELEPHONES & BELLS.—Two lists have been issued during the past week by Messrs. Johnson & Phillips, Ltd. One of these deals with telephones for domestic use, with either battery or magneto call, as well as portable and testing telephones, and the other is devoted to bells, indicators, &c.

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

SUMMARY

MR. A. H. DYKES replies to Mr. FAYE-HANSEN'S letter in our last issue with regard to losses in 25-volt transformers. Correspondents ask for the names of makers of alloy-steel for transformers and of a remote-control switch for small currents. (Page 690.)

THE address delivered on Thursday last by Mr. W. M. MORDEY, as President of the Institution of Electrical Engineers, consisted of a comparison between the condition of the electrical industry of this country, as indicated by the statistics and returns relating to electricity supply, with the electrical industry abroad, perticularly in Germany. He showed some tables which gave the average consumption in units per inhabitant and the average price per unit paid, and other interesting figures for representative towns in both this country and in Germany. From these figures the conclusion was arrived at that in the large towns in Germany electrical energy costs twice as much per unit, and the consumption per inhabitant is half as much as in our large towns; further, in the medium-sized and small towns in Germany, although the consumption per inhabitant appears to be about the same, the price per unit is over 30 per cent. higher than in the corresponding British towns. Further, the capacity of the generating plant in all the public supply stations in this country is about two and a quarter times as much per inhabitant as in Germany, and in the relative statistics with regard to tramway work we do not compare unfavourably. With respect to several towns in Europe, which obtain their supply from large water-power stations, Mr. Mordey quoted figures which showed that the lowest of the average charges made in these towns was higher than the average price obtained in Bolton, which is 1·18d. per unit; Lyons comes second with an average price of 1·27d. per unit. In conclusion, Mr. Mordey insisted that our alleged backwardness did not exist, and that there was no justification for the statements about our scientific and technical education being behind other countries. (Page 691.)

MR. W. W. LACKIE, in his inaugural address as Chairman of the Glasgow Local Section of the Institu-

Digitized by Google

tion of Electrical Engineers, dealt with load factors and diversity factors, offering a number of alternative definitions. We make use of the opportunity to explain clearly the accepted definitions of these two "factors." The address also included a useful table giving the load factors and other useful information with regard to various classes of power consumers, and an explanation of the method of calculating the charges to consumers at Glasgow. (Page 693.)

In his written reply to the discussion on the Paper on turbo-alternators, read before the Manchester Local Section of the Institution of Electrical Engineers, Dr. M. Kloss answers the questions put by several speakers, and makes some further remarks with regard to the limitation of the output of turbo-alternators by the heat limit of the rotor. (Page 694.)

Tenders from fifteen firms have been received by the London County Council for the supply of turbo-generators for the second portion of the Greenwich generating station. The lowest tender was sent by Messrs. Belliss & Morcom, Ltd., but the Committee have rejected this on the ground that the firm have not manufactured machines of a size similar to those now required. They recommend the acceptance of a tender by the British Westinghouse Electric & Manufacturing Co. at £40,800, the turbines being of the Rateau type. (Page 695.)

That section of the report of the Special Committee on Brakes appointed by the Tramways and Light Railways Association, which relates to the training of tram-car drivers, contains a proposed course of instruction for intending drivers, and other recommendations. Annual re-examination in the working of the electrical and mechanical equipment and in the general regulations is proposed, and a medical examination every five years is strongly recommended. The importance of strict discipline is also emphasised. (Page 695.)

At the first general meeting of the new Institute of Metals, the President, Sir William White, described the origin and objects of the Institution, and several Papers were read. Among the latter was one by J. T. Echevarri on the properites and uses of aluminium, and another by W. H. Robertson on the manufacture of tubes contained brief references to the different electrolytic processes. (Page 696.)

In a Paper read before the North-East Coast Institution of Engineers and Shipbuilders, Mr. J. B. Duckitt dealt with the electrical equipment of cranes, particularly with reference to the rating of crane motors and methods of braking and regenerative control. The author recommended a system of control in which the motor acts purely as a series motor when hoisting, and regenerates as a shunt motor when lowering. A special method of stating the rating of motors for intermittent work, which is based on the ratio of the time during which the motor is on load to the time during which it is switched off, is also described. (Page 697.)

In an article on depreciation and obsolescence in small engineering works, Mr. W. O. Horsnaill puts in a plea for more accurate account being taken of the actual residual value of the plant. He points out that one of the reasons for turning out good plant in favour of more economical machinery is that the value of the former is much higher before the new methods have made headway. (Page 699.)

At a special meeting of the Elektrotechnischer Verein, which is to be held in Berlin this evening, a discussion will take place on the proposal of the German Government to impose a tax on electricity, gas, and illuminating apparatus. As an example, illustrating the heavy nature of the proposed tax, we reproduce some figures published in a German contemporary which have been estimated on the basis of the actual consumption of energy, lamps, &c., of a large ironworks on the Rhine. The tax in this particular instance totals up to £2,670, or over one per cent. of the share capital of the company. (Page 700.)

Mr. W. N. Y. King read a Paper at an informal meeting of the Leeds Section of the Institution of Electrical Engineers yesterday, comparing natural and induced draught for steam raising. The Paper contained figures giving the cost of a particular plant and sketches showing its arrangement, a set of curves connecting height of chimney, draught pressure, and chimney temperature in the case of natural draught, and also a number of general considerations with regard to induced draught plant. (Page 701.)

The latest pattern of mercury vapour quartz lamp has a tube length of only from 3 in. to 6 in. As the tube is of quartz, a very high working temperature is permissible, but an outer globe of special glass is necessary to absorb the injurious ultra-violet rays. The tube is tilted automatically to strike the arc, and special arrangements are provided to render the arc steady and free from the effects of fluctuations in the supply pressure. (Page 704.)

Sir Luke White's Committee of the House of Commons has rejected the London and District Electricity Supply Bill. The preamble of the London Electric Supply Bill, which gave the existing companies power to link up their undertakings, &c., has been passed. A clause has been inserted constituting the London County Council the purchasing authority in substitution for the Borough Councils, the County Council to give three years' notice of their intention to purchase all the companies' undertakings in 1931 and during the three years period of notice to lend the necessary sums for the development of the undertakings at an agreed rate of interest. The repayment of these sums will simply be made by a reduction in the purchase price. During the proceedings the promoters of the Bill threatened to withdraw it if the terms of purchase were not satisfactory to them, and on Tuesday they again reserved their right to withdraw the Bill should necessity arise. (Page 706.)

We give particulars of a number of Bills which will be deposited for the Parliamentary session of 1909. (Page 708.)

Damages have been awarded in the Appeal Court to the Barnes Urban District Council against the London General Omnibus Co. for damage to eighteen lamp posts by the Company's 'buses.—With reference to the new power station of the Bury Corporation the Local Government Board have approved of the plans, but ask for further details on certain points before sanctioning a loan of £72,000.—In a report upon a fire at the Dublin City Hall, which was attributed to electricity, Mr. Mark Ruddle states that at the time the fire took place the supply to the building was switched off.—A statement has been issued by the Kalgoorlie Electric Tramway Co. stating that the recent fall in the price of the Company's stock has been brought about by decreased receipts consequent upon a reduction in the number of men employed at the mines, upon which the Company chiefly depend for its revenue.—An action is being taken by the Limerick Corporation against Messrs. Crompton & Co. for damages for delay in the execution of an electrical contract.—A proposal has been made that the Preston Corporation should purchase the National Electric Supply Co.—The Birmingham Corporation Tramways Committee recommend a large expenditure upon new tramways. (Pages 709 and 710.)

Plans have been prepared for a combined pumping, electric light, and power station for the Belfast Harbour Commissioners. Local Government Board inquiries have been held as follows:—Birkenhead, £20,000; Neath, £18,000; Radcliffe, £14,350; Wrexham, £4,165; and Hastings, £1,683. The Local Government Board has sanctioned a loan of £12,400 for new tramways at

Digitized by Google

Liverpool, and £1,000 for free wiring. The Manchester Corporation Tramways Committee require tramway rails and tramcar axles, and the Electricity Committee, exhaust steam circulating water- and air-pump discharge pipes. A Diesel oil-engine and dynamo is required by the Felixstowe Urban District Council. (Page 711.)

THE accounts of the Electromobile Co. for the year show a deficiency of £1,444. A profit of £5,516 is shown by the accounts of the Isle of Thanet Tramways and Lighting Co. for the year ended September 30th, and, after adding £2,500 to the reserve fund, a dividend of 1¼ per cent. is recommended upon the preference shares. Although the revenue of the Singapore Electric Tramways Co. for 1907 showed a substantial increase, there is a loss upon the year's working owing to the large amount required for debenture interest, depreciation, and royalties. Applications have been invited during the week by the Brush Electrical Engineering Co. for an issue of £100,000 prior lien 5 per cent. debenture stock. A scheme of reorganisation of the Anglo-Argentine Tramways Co. is being placed before the shareholders. (Page 712.)

AMONG the specifications published by the Patent Office on Thursday last is one by the BRITISH THOMSON-HOUSTON Co. covering a process for the manufacture of a nickel-iron resistance alloy. A specification by E. C. and M. EKSTROMER relates to the production of a particularly porous active material for storage battery plates, and another by S. EISENSTEIN proposes the use of a Wehnelt cathode-ray tube in the Duddell oscillating circuit for wireless telegraphic purposes. An armature winding for ensuring better commutation in high-speed continuous-current and alternating-current commutator motors is protected by E. F. W. ALEXANDERSON, and the WOLFRAM-LAMPEN AKT.-GES. have a specification relating to the manufacture of compound metal filaments. A new method of constructing commutators is patented by BROWN, BOVERIE & CIE. AKT.-GES, and in a specification by the SOCIÉTÉ ANONYME WESTINGHOUSE and R. BRUN a flywheel motor set for taking an intermittent load with constant current consumption is described. Short abstracts of the above are given in our Patent Record. (Page 715.)

THE throwing out of the London & District Electricity Supply Bill has had a beneficial effect upon the prices quoted for the shares of the London electric supply companies on the Stock Exchange. (Page 716.)

MR. MORDEY is always outspoken, and we welcome the defence of the British electrical industry and his attack on its detractors, which he has given us in his Presidential Address before the Institution of Electrical Engineers. He has taken the electricity supply industry as the criterion of the activity of the electrical industry, and he has shown that we are well in advance of other countries, not only in the employment of electricity as measured in units per head of population in our large towns, but also in economical generation, as evidenced by the works costs and in the cheaper price at which electrical energy is retailed to the consumer. These conclusions apply to electric power as well as electric lighting. Nor are we retrograde with regard to electric tramways, especially when the Britisher's love of fresh air and exercise is taken into consideration. That there is a smaller margin between cost of production and selling price in this country is rather favourable to increased activity in the electrical industry than adverse to it, for, as the bulk of the supply is by municipal authorities, it simply means that the prices are not kept up to enable the electricity supply department to contribute to the general rates. Mr. Mordey has, however, only covered part of the question. If we are buying too large a proportion of our generating machines, lamps, motors, and cables abroad, or if over-production in manufacture in this country counterbalances the increased production of electrical energy, no amount of economy in electric supply can put our industry on a sound footing. We believe, however, that the tide has now turned, and that the depression in our industry is rapidly lifting. Mr. Mordey's address should help to dissipate the gloom with which electrical engineers have surrounded themselves during the past two years, and should do something to instil a little more enthusiasm into their work. Great Britain holds the record for economical electrical supply, and it should now regain its position as the leading country for electrical manufacture.

AFTER the action of the Government in affording facilities for the second reading of the London and District Electricity Supply Bill, and the pronouncement of the President of the Board of Trade on that occasion that such a bulk supply scheme was not only necessary but essential to the industrial well-being of London and the surrounding districts, the summary rejection of the scheme on preamble by a unanimous vote of the Select Committee can only be regarded in the light of a political decision. As Select Committees of Parliament are not called upon to justify decisions, we are not likely to know the real reasons which weighed with Sir Luke White's Committee in rejecting the Bill, and the action of a committee with the same chairman in 1906, which issued a special report upon the London County Council Electric Supply Bill, is in sharp contrast with the present course of action. In seeking, by deduction, to arrive at the possible reasons, one is forced to put on one side the scheme of the Bill and the finance of it. The Bill was admittedly framed upon that of Mr. Merz in 1905, and Sir Luke White himself had characterised this as a scientific scheme, and one which, in the absence of a Bill by the London County Council, should be passed. The financial proposals of the Bill, whilst, on the surface, of a somewhat nebulous character, were deemed satisfactory to Lord Cromer's Committee after a very much more detailed hearing than took place in the House of Commons. Moreover, in addition to Lord Cromer, who has had such an extensive experience of economic problems in Egypt and South Africa, the House of Lords Committee also included Lord Welby, a great financier, and for several years Chairman of the Finance Committee of the London County Council. It says much for the versatility of counsel, by the way, that Mr. Balfour Browne, K.C., who has frequently argued successfully that it is unfair to expect promoters to guarantee capital before a Bill is passed, should, on this occasion, have waxed eloquent over the enormities of the present promoters in this respect. The rejection of the London and District Bill, in conjunction with the subsequent important proceedings before Sir Luke White's Committee on the London Electric Supply Bill (which are fully reported on another page) may be regarded as the closing of the London electric power controversy for many years to

Digitized by Google

come. Now that the London County Council have been substituted for the Borough Councils as the purchasing authority over the existing companies, and that a more or less unified electrical undertaking will be at their disposal in 1931, there would seem little need for them to set up a rival undertaking. The policy of altering the general law in a private Bill, however, as has been done, can hardly be said to have been successful. Obviously, Sir Luke White and his Committee are far from familiar with all the intricacies of the various Provisional Orders and their terms, which apply to different portions of London, and the task put upon them was clearly one for the Government Department concerned, and would have been carried out much better in a Government measure. As it is, legislation of a kind has been enacted, but it will afford ample work for the lawyers to interpret it when the time comes, unless the Government now "fathers" the Bill on third reading, and subjects the clauses to a thorough revision, with the assistance of the permanent officials of the Board of Trade. As the Bill now stands, however, the position of the existing companies has been considerably strengthened, and, even with the extinction of their claim for compensation for "severance" as between one district and another, they will obtain as the purchase price something over and above the bare terms of the Electric Lighting Act of 1888. In addition to this, the wide "linking up" powers should afford means of effecting considerable economies in distribution and generation in many cases, and the extension of their sphere of action with regard to electric power supply cannot fail to be beneficial to the electrical industry generally.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 26TH.

Institution of Electrical Engineers.

8 p.m. Meeting at 25 Great George Street, Westminster. Papers to be read:—(1) "Domestic Electric Supply (including Heating and Cooking) as Affected by Tariffs," by W. R. Cooper. (2) "Commercial Electric Heating," by J. Roberts (Durban).

FRIDAY, NOVEMBER 27TH.

Electro-Harmonic Society.

8 p.m. Concert (Ladies' Night) at King's Hall, Holborn Restaurant.

SATURDAY, NOVEMBER 28TH.

Rugby Engineering Society.

12 noon. Party leaves Rugby by 12.42 p.m. London express to pay visits to Fisher Street sub-station of the Metropolitan Electric Supply Co.; Taylor's Lane (Willesden) generating station of the North Metropolitan Electric Power Supply Co.; Central London Railway power station at Shepherd's Bush.

TUESDAY, DECEMBER 1ST.

Institution of Electrical Engineers: Manchester Local Section.

7.30 p.m. Meeting at the University. Paper to be read:—"Transformers: Some Theoretical and Practical Considerations," by A. T. M. Fleming and K. M. Faye-Hansen.

WEDNESDAY, DECEMBER 2ND.

Institution of Electrical Engineers: Birmingham Local Section.

7 for 7.15 p.m. Annual dinner at the Grand Hotel, Colmore Row.

Institution of Electrical Engineers: Students' Section.

7.30 p.m. Meeting at 92 Victoria Street, Westminster, London. Paper to be read:—"Electric Road Vehicles" (other than tramcars), by S. H. Hills.

THURSDAY, DECEMBER 3RD.

Civil and Mechanical Engineers' Society.

8 p.m. Meeting at Caxton Hall, Westminster. Paper to be read:—"The Influence of Track upon Railway and Tramway Carriages," by J. Sutherland Warner.

Röntgen Society.

8.15 p.m. Ordinary general meeting at 20 Hanover Square, London. Paper to be read:—"Phenomena Observed in Electrical Currents of Continuous Oscillation," by Dr. Horace Manders

CORRESPONDENCE

25-VOLT TRANSFORMERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Mr. K. Faye-Hansen, in his letter on the above subject, makes me say that the full load loss on the balancing transformer will be 29 watts as against his figure of 17 watts I fear that the wording in my article was not quite clear, or that he has misread it, as what I meant to say was that the full load losses were approximately 18 to 20 watts, the higher figure of 28 to 30 watts being the loss when the loads on the various circuits of the transformer are out of balance. As others may have made the same mistake in reading the Paper, perhaps you will kindly insert this correction.

I am glad to note that otherwise Mr. Faye-Hanson and myself are in agreement, and that the figures I have given, which obviously must vary with different makes and types of transformers, agree on the whole so closely with those of the Westinghouse Co.

Referring again to the balancing transformers, it should not be forgotten that it is only when the circuits are equally balanced that the losses are as low as 20 watts, a condition of affairs which does not frequently happen in practice.

Yours faithfully,

A. H. DYKES.

1 Victoria Street, London, S.W.,
November 23rd, 1908.

ENQUIRIES.

(*In replying to enquiries, firms are requested to mention* ELECTRICAL ENGINEERING.)

Alloy Steel for Transformers.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—We wish to secure information in regard to alloy steels which are manufactured in England or in Germany. At present we are using in our transformers an alloy steel which is manufactured in this country, but we wish to investigate some of the foreign steels. Can you give us the name of any manufacturers in England or in Germany who are manufacturing this material? Thanking you for your favour, we beg to remain,

Very truly yours,

PITTSBURGH TRANSFORMER CO.

Pittsburgh, Pa., November 13th, 1908.

Small Remote-Control Switch.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Can any of your readers inform me where I can obtain a simple half-ampere quick-break lamp switch, to be operated at a distance by an eight- or ten-volt battery of Leclanché cells, either with or without a relay? I wish to make use of the above in a system of fire-alarm signals.

WM. P. M.

November 21st, 1908.

[We shall be pleased to send on replies to our correspondent.—ED. E. E.]

P. & O. Batti Wallahs Society.—The second smoking concert of the season is to take place on December 7th, at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, in the Middlesex Room, at 7.45 p.m.

Leeds Local Section.—The Paper on "Natural and Induced Draught," by Mr. W. N. Y. King (published on p. 701 of this issue) has not yet been formally approved by the Council of the Institution of Electrical Engineers, but it was read at an informal meeting of the Leeds Local Section yesterday. The word "informal" should have been added in the introduction to our article on p. 701, but we only receive this information as we go to press.

Wireless Telegraphy and Telephony.—According to a British Consular Report, wireless telegraph stations are to be established permanently at Algiers and Oran, the latter being erected by the French Admiralty, the former by the Postmaster-General. The Oran station may accept private messages in time of peace, but it is established primarily as a means of communication in time of mobilisation. The Algiers station will be situated at Fort de l'Eau, some ten miles east of the town, on the bay, the station at Mustapha being done away with. It will be open to all private telegrams, and will communicate direct with Port Vendres and the Eiffel Tower.

The *Daily Chronicle* states that successful experiments with wireless telephony have been carried out between the Eiffel Tower and Melun, over a distance of 30 miles, and that Prof. Majorana has made equally successful experiments between Maddalena Island, on the Sardinian coast, and the fortifications of Montemario, at Rome. The Italian Government has placed a warship at Prof. Majorana's disposal for long-distance experiments in the Mediterranean and the Atlantic.

SOME COMPARISONS OF THE ELECTRICAL INDUSTRY IN THIS COUNTRY AND ABROAD

MR. W. M. MORDEY, President of the Institution of Electrical Engineers, delivered his Presidential Address last Thursday. He made a comparison between the condition of the electrical industry in this country, as indicated by the statistics of returns relating to electricity supply, with the electrical industry abroad, particularly in Germany. His attention had been specially directed to some resolutions which were passed five years ago by a committee of engineers and business men prominently connected with electrical engineering, and he was asked to consider what steps, if any, it would seem to be advisable to take in view of those resolutions.

The first resolution was as follows:—

Notwithstanding that our countrymen have been among the first in inventive genius in electrical science, its development in the United Kingdom is in a backward condition as compared with other countries in respect of practical application to the industrial and social requirements of the nation."

To answer the question whether it is true that this country is in a backward condition as compared with other countries in respect of practical application to the industrial and social requirements of the nation, Mr. Mordey said, it is only necessary, so far as the service of the public is concerned, to find the extent to which the systems of supply of electrical energy in different countries provide for the requirements of the public; or, in other words, to find the average consumption in units per inhabitant, and the average price per unit actually paid. He has prepared some tables giving this information for a large number of towns here and abroad, particularly Germany. The figures for Great Britain are based on the returns rendered to the Board of Trade by the supply authorities, and those for Germany on a very useful annual volume of statistics, edited by Herr Döpke, and published at Dortmund by the Vereinigung der Elektrizitätswerke, which are based on official or specially collected and authoritative returns. In some cases he has supplemented this information by further particulars furnished in response to his own applications.

Mr. Mordey sums up his conclusions as follows:—

1. In the large towns in Germany electrical energy costs twice as much per unit, and the consumption per inhabitant is half as much as in our large towns. The difference in the cost of coal is insignificant, and does not account for the higher price. The labour there costs more than it does here.

2. In the medium-sized towns the price in Germany is 33 per cent. higher than here, and the consumption is about the same as here in our medium-sized towns.

3. In the small towns in Germany the price is 40 per cent. higher and the consumption is about the same as here.

4. Our public generating stations contain two and a quarter times as much power per inhabitant of the whole country as those of Germany.

5. In electric tramway work we do not compare unfavourably.

As regards important towns in other countries, while the advantage of cheap and ample water power in a few places has enabled an extensive supply to be given at low prices—notably in Lyons, Geneva, and Grenoble—the lowest price in any town here tabulated is in a British town; Bolton, with its average of 1·18d. per unit, heads the list, and Lyons is second with 1·27d. per unit.

There is nothing in our electrical work to justify in any way the charges that have been so freely made against us. There is one thing I think I ought to say—these depressing charges have not originated abroad; they are entirely of home production. Our alleged backwardness does not exist; we are ahead, and well ahead. I do not wish it to be thought, however, that there are no hindrances—legislative or otherwise—to our getting still further ahead. But I do wish to say that, in my opinion, there is no more justification for the statements about our scientific and technical education being behind other countries, than for the statements about the backwardness of our electrical engineering. I resent very strongly the disparagement of the results achieved in this country by the band of teachers, eminent over the whole world, who have been responsible for the scientific and technical education of the engineers concerned in the development of our industry. Technical education should be judged, not by the wealth of the equipment of laboratories, but by the engineering results achieved in the country.

The comparison in the tables is made as follows:—First London and Berlin are compared. London has a total consumption of 131·1 million units for light, 43·6 million units for power, or a total of 176·7 million units. In Berlin, the corresponding figures are 41·0, 53·7, and 94·7. These are worked out into the number of units per inhabitant, which are as follows:—London: Lighting, 28·0; power, 9·3; total 37·3. Berlin: Lighting, 15·8; power 20·7; total, 36·6.

Next, three groups of towns are taken, six towns in each group, arranged according to population, to show the conditions respectively in large, medium, and small towns. The figures necessary for this comparison are given for each town, and are averaged for each group. The towns were selected in the following way. A list of the towns was arranged in order of their populations, ranging from 10,000 to 20,000 for the small towns, and from 100,000 to 200,000 for the medium-sized towns. Then six towns were selected from each group, distributed uniformly according to population. For the group of large British towns—of more than 350,000 inhabitants—Glasgow and Bristol, the first and the last of the list, were excluded in order to restrict the group to six towns. The order of selection was in no way influenced by the electrical results—in fact, those results were not known at the time. In the case of Germany, the list was made only of those towns for which the information was available.

In the case of all these towns, more detailed comparisons have been made than in the case of the two capitals, as for Berlin all the figures were not available. Table I., on p. 692, gives a summary of the results. The figures are for light and power combined, but as the two totals were ascertainable separately a further comparison was made in the detailed tables in the address. Thus, the average for the six largest towns shows 12·7 and 12·2 units per inhabitant for light and power respectively in British towns, and 7·68 and 5·27 in German towns. The average price paid by the consumer per unit is 3·22d. for light and 1·00d. for power in Great Britain and Ireland (Belfast is included in these six towns), and 5·67d. and 2·12d. respectively in Germany. Bolton has the lowest figure for the average price per unit, viz., 1·18d. It is lower than any of the German towns; Mulhausen is the lowest German town at 1·61d. At Bolton the average price charged for power is 0·56d. per unit, as against 0·93d. in Mulhausen (the lowest German average power price).

An important column in the detailed tables is that showing the gross profit as a percentage of the total capital expended. This shows a larger gross profit in Germany, and in view of the fact that in both countries nearly all the systems examined are under municipal control, Mr. Mordey pointed out that it indicates that the municipalities are taxing the consumers of electricity for the benefit of the rates. The wages and salaries costs were inserted to test the usual opinion that in Germany labour is cheap. The column headed "Wages and Salaries" for the British towns includes also management, office, legal, and insurance charges, whereas in the case of the German towns it includes only wages and salaries, the information regarding management, office, legal, and insurance charges not being obtainable from the German records.

In all three classes of towns labour is higher in Germany than here, which shows that low wages and long hours do not necessarily mean cheap labour. Another possible explanation, Mr. Mordey added, is that more labour is required with German

Digitized by Google

machinery. If the wages and salaries column had included the same in the two cases the comparison would have been still more in our favour.

Table II. compares the total power provided in Germany and Great Britain respectively for the public supply of electrical energy for lighting, power or traction, providing a further proof that there is no foundation whatever for the common belief in British backwardness in electrical supply. Our generating stations contain two and a quarter times as much power per inhabitant as those of Germany.

Table I.—*Electric Light and Power.*

Towns.	Per inhabitant. Units.	Revenue. s. d.	Per unit. Price. d.	Difference. d.	Per cent.	Coal. d.	Wages & Salaries. d.	Coal plus Wages, &c. d.	Difference. d.	Total costs. d.	Difference d.

Table II.—*Total Kilowatts of Generating Plant in Power Stations for Public Supply or for Tramways.*

	Kilowatts.	Population.	Watts per inhabitant.
Great Britain	983,181	45,000,000	21·8
Germany	612,652	63,000,000	9·7

The power in the stations in Great Britain is made up as follows:—

	Kilowatts.
282 public supply stations	688,117
14 power companies' stations	107,480
48 separate tramway stations	94,144
16 electric railways stations	93,440
	983,181

Information which Mr. Mordey had collected with regard to a number of important towns in different parts of the world outside of Germany showed that, with the exception of a very few places which have ample and cheap water power, the supply of electrical energy, and its cost to the public, does not compare favourably with ours. In Zurich and St. Gallen in Switzerland, in both of which the supply is partly from water power, the average price is 75 per cent. higher than in the medium-sized British towns. Lyons has water power and a very large industrial motor load. Its price for lighting is, however, high, and the consumption only about half as much as the average of our large towns. The power load is, however, the largest in the list, and yet the average price per unit is 1·27d., as against 1·18d. in Bolton. The average price for power in Chicago is 2·08d., against 1·73d. in London and 1·0d. in the large British towns. The price for light is 3·52d., as compared with 3·27d. in London and 3·22d. in the large British towns.

Table III. contains information enabling a comparison to be made between two groups of British towns and two corresponding groups of German towns in respect of tramway statistics. The differences between the two countries are much less than in the supply statistics. In capital expended per inhabitant the large British towns show rather less than the corresponding German towns, while in the medium towns the positions are reversed. In journeys per inhabitant there is very little difference in the large towns, but in the medium towns there is a difference of 18 per cent. in favour of this country. In revenue per inhabitant the German average is slightly higher than ours. The length of single track per inhabitant is greater in the large German towns, and nearly equal in the medium towns to the British figures. The most striking difference between the two countries is in the car miles per inhabitant - the German figures being nearly double the British for both groups of towns. This difference is, of course, due to the use of small cars in Germany. An examination of the German statistics shows that in all the towns mentioned in the table the average normal or licensed carrying capacity of the cars (including standing space, which is allowed in German practice) is 33 passengers—probably the average capacity of our cars would be about 50 passengers. In Germany the average revenue per passenger is slightly higher than here—we do not know the average distance travelled.

The cost per passenger—a very important quantity—is distinctly higher in Germany in both groups of towns, being 9 per cent. higher in the large towns and 14½ per cent. higher in the small ones.

The total cost per car mile is lower than here. Low wages help in this. As only two attendants can be employed on each car, low wages and low cost of labour are synonymous. The comparison of the ratios of costs to revenue is in favour of the British towns.

Table III.—*Electric Tramways.*

Towns.	Per inhabitant. Capital. £	Journeys.	Revenue. s. d.	Yards of track.	Car-miles.	Per passenger. Revenue. d.	Cost. d.	Per car-mile. Revenue. d.	Costs. d.

,, ,, German	1·79	78	7 7	0·30	15·2	1·15	0·79	5 9	4·1

On the conclusion of Mr. Mordey's address, Colonel CROMPTON proposed a vote of thanks to the President for his interesting, instructive, and patriotic address. Prof. KAPP, in seconding the proposal, congratulated Mr. Mordey on the exact and scientific nature of his address; and, as one who had been in close touch with the electrical industry and electrical undertakings in Germany, he supported the figures given by Mr. Mordey. He thought the address highly opportune, and hoped that it would discourage the old habit of disparaging our own work. Mr. MORDEY replied briefly, thanking the meeting for the reception given to his address, and expressing his indebtedness to his two assistants, Mr. Green and Mr. Haslam, in collecting and preparing the numerous statistics.

Electrical State of the Upper Atmosphere.—There exists under normal conditions a potential gradient in the atmosphere surrounding the earth. The earth being negatively charged with respect to the air, a continuous electric current flows from the upper atmosphere to the earth. It follows, therefore, that a kite attached to an earth-connected wire will tend to assume the potential of the air surrounding it, and an electric current will flow continuously down the wire to earth. Experiments, undertaken with a view to determining the magnitude of this current when the kite was at different heights above the ground, were described in a Paper by W. Makower, M. White, and E. Marsden, read recently before the Royal Meteorological Society. The authors found that in general a high wind produced at a given altitude an abnormally high value of the current flowing down the wire. Whether the action of the wind is to be accounted for by the greater volume of air which passes in a given time over the sails of the kite, so giving a greater volume of air from which electricity is collected, or whether the action of the wind is to be attributed to electrification by friction, the authors could not say.

LOAD FACTORS AND DIVERSITY FACTORS

LOAD factors and diversity factors formed the subject of Mr. W. W. LACKIE's Address as Chairman to the Glasgow Local Section of the Institution of Electrical Engineers on November 10th. Mr. Lackie, who is Engineer-in-Chief of the Glasgow Electricity Department, dealt with this subject partly in order to put forward a number of alternative definitions that have been suggested from time to time for load factor and diversity factor, and partly to explain the principle underlying the system of charging at Glasgow.

We will not reproduce the numerous definitions of load factor and diversity factor given, as the multiplicity of these merely tends to confusion. The definitions of these two "factors" introduced by Mr. Robert Hammond and Mr. Arthur Wright, and generally accepted throughout the electrical industry, are as follows:—

Load factor is the ratio of the average load, represented by the actual sales to consumers, to the maximum load supplied to the feeders at the station, expressed as a percentage. That is to say, it is $\frac{\text{Number of Units sold during the year} \times 100}{365 \times 24 \times \text{Maximum Load}}$. One point that is sometimes overlooked is that, even if all the consumers had a steady 24-hour load, the load factor as thus defined could not be 100 per cent., for the average load represented by the number of units sold divided by 365 × 24 includes the losses in distribution—*i.e.*, the "units unaccounted for" in the Board of Trade form of accounts—and these may be a considerable percentage, especially in the case of A.C. transformer systems. The definition above is the accepted one, however, and should not be varied. An ambiguity that sometimes occurs is that, in calculating load factors, some engineers take the maximum load as the total maximum load on the 'bus-bars, including the power used on the works; and others take only the maximum load supplied to the feeders, which is the more correct way. If the power used on the works is included, the load factor will often come out at a much lower figure.

The diversity factor is the ratio of the sum of the consumers' maximum demands to the maximum demand on the feeders at the station 'bus-bars. It is thus always greater than unity, although there can be a hypothetical case in which the consumers' maximum demands might occur simultaneously, in which case the demand on the feeders would be greater, as it would include the distribution losses, so that in this instance the diversity factor in accordance with the accepted definition would actually be somewhat below unity. In calculating diversity factor, the station auxiliaries and lighting may be regarded as a consumer, if desired, in which case the ratio would be taken of the sum of the consumer's maximum demand and the maximum demand by the station auxiliaries and lighting to the maximum power delivered from the 'bus-bars, including the power used on the works. This is usually not done, however; as a rule, its tendency would be to reduce the diversity factor.

Last May there were 3,583 motors connected to the Glasgow Corporation mains used for 113 different trades or purposes. The load factor from these (that is presumably excluding the units sold for lighting and the maximum power for lighting) Mr. Lackie estimates at 38 per cent. The following list of trades with the load factor of each, the ratio of maximum demand to the power installed (wrongly called "diversity factor" by Mr. Lackie), and other information is of considerable interest. In this case, the load factor of each set of consumers is, of course, the ratio between the average and maximum load of each particular set of consumers. The numbers in the first column represent the number of consumers for which the figures are calculated in each case:—

No. of consumers.	Occupation.	Total H.P. for trade.	Load factor for trade.	H.P. of M.D. H.P. installed per cent.	Revenue per H.P. of M.D. £ s. d.	Revenue per H.P. installed. £ s. d.
36	Bakers	578	11%	62	3 13 4	2 7 0
10	Bookbinders ...	30	12·2%	72	5 2 0	3 13 0
60	Butchers ...	222	9%	58	3 8 3	2 15 0

78	Engineers ...	2563	23%	66	6 9 0	4 6 0
77	Hoists	834	4·6%	100	2 0 3	2 0 3
12	Ironworks ...	808	26%	55	6 11 5	3 13 0
68	Printer and Publisher ...	1328	11·5%	58	4 8 0	2 12 0
Total on station:—						
3583	113 trades ...	23,748	38%	37	£10 0 0	£2 16 0

Dealing with the system of calculating the charges to consumers at Glasgow, Mr. Lackie said:—

A fair method of charging would be some such figure as £6 per kw. of maximum demand for lighting and £4 per kw. of M.D. for power, plus the cost of coal and other stores per unit. To meet the lighting consumers' convenience in Glasgow the £6

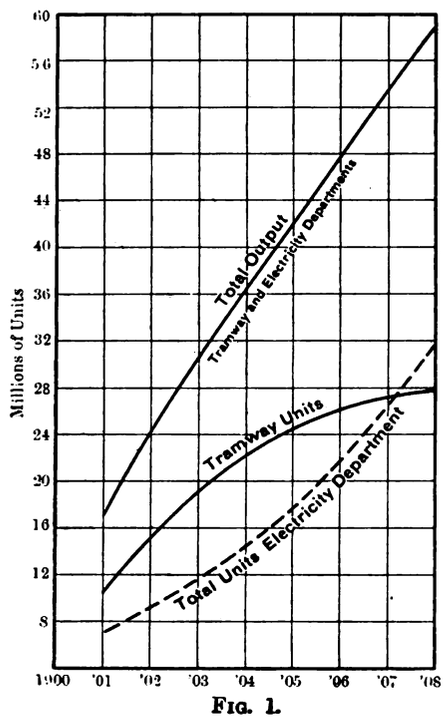

FIG. 1.

is divided up into 730 equal payments, and in the case of the power consumer the £4 into 1,000 equal payments, but if a set of consumers do not use their maximum demand for 730 and 1,000 hours respectively, they do not pay all their standing charges and are therefore a loss to the undertaking notwithstanding the fact that throughout they have to pay the higher or initial rate under the maximum demand system. In other words, a consumer paying the maximum charge per unit allowed by the B.O.T. (say 6d. or even 8d.) may be an unprofitable consumer, while an industrial user paying ¾d. per unit throughout for a long hour power supply will make a solid contribution to the profits of the supply undertaking. All the figures I have used are based on a capital cost per kw. of £80. If the capital cost is greater than £80 per kw., the figures will be increased proportionately and *vice versâ*. This is the principle underlying the maximum demand system of charging as used in Glasgow.

In the supply of energy for lighting and power we have to meet two entirely different sets of conditions. The *power* load is practically uniform without a peak for nine hours a day and 300 days in the year; while the lighting load has a very pronounced peak for about two hours in the winter afternoons. The lighting load is, of course, at its maximum in winter and at its minimum in summer. Until some means has been devised of overcoming these varying conditions it will continue to be

Digitized by Google

necessary to differentiate between the charges for lighting and those for power supplies. At present many companies and supply authorities in supplying energy for power purposes allow their consumers to use 5 or 10 per cent., and in some cases 20 per cent. of their consumpt for lighting, the whole being charged at power rates. If this is right, we may look forward to the time when the total demand for lighting will be, say, only 10 per cent. of the total output, the other 90 per cent. being used for power and heating purposes; and electrical energy used for lighting purposes will then be thrown in at a price corresponding to our charge for power to-day. The effect of the metallic filament lamp helps on this idea by reducing the present demand and corresponding consumpt of energy for lighting purposes, whereas we know that no such vital change in the efficiency of motors can take place to reduce in a similar manner the demand made by them. The passing of the Daylight Bill, which was recently before Parliament, would also make for the same end, although I do not wish nor think it will pass.

Figs. 1 and 2 show the demands for lighting and power in Glasgow since 1901, from which you will see that the lighting demand, while it is still on the increase, is growing in a decreasing ratio as compared with the power demand, and next year it is anticipated that the power demand will exceed that for lighting. If we take the units used for tramway purposes and add them to the units used for power purposes delivered from the electricity department for last year we find that 42,000,000 units were used for power purposes, and 15,000,000 for lighting,

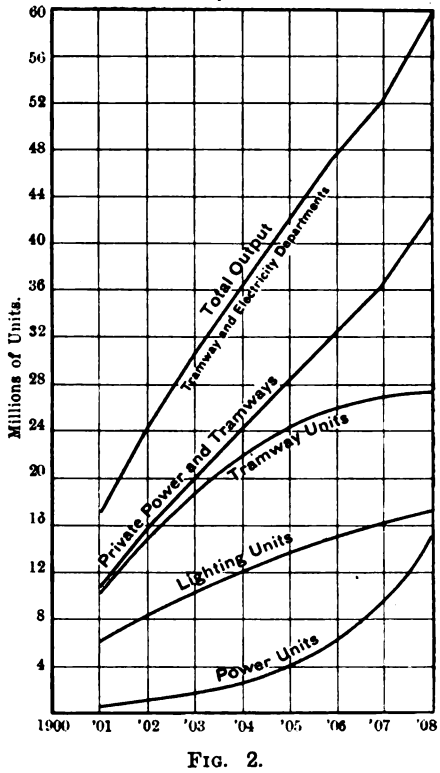

FIG. 2.

or 26 per cent. of the total units generated were used for lighting.

Much has yet to be done in the way of supplying electricity for heating purposes. It is commonly said that the absence of a good storage system is the only obstacle that stands in the way of a flat rate being adopted all round; but until the effective storage battery comes we must bend our efforts to find ways and means to create a demand which will keep the plant running during those hours of the day and night when it is not fully taxed to supply the power and lighting demands. In a city such as Glasgow, however, subject to fogs, the nature of the demand between 6 a.m. and 6 p.m. must be very carefully watched, but after 6 p.m. the supply station engineer should welcome any demand almost irrespective of its nature. Beyond encouraging the sale of energy for power purposes so as to improve the load factor or ordinary day load, the present position of affairs might be bettered by seeking to develop the demand for electrical energy after 6 p.m. for illuminated signs and other forms of decorative lighting. I understand the American Supply Companies do a large business in this way after 6 p.m. by offering electrical energy for this class of lighting at a low rate.

The use of larger units in the generating station would also mean a saving in capital and in the consumption of coal; and further instalments of plant will enable the supply undertaking to make fuller use of plant and buildings which are at present earning practically no revenue.

THE RATING OF TURBO-ALTERNATORS

THE written reply of Dr. M. Kloss to the discussion on his Paper on the rating of turbo-alternators has now come to hand. An abstract of the Paper and the ensuing discussion, which took place at Manchester on November 3rd, was given on page 637 of our issue of November 12th. It will be remembered that Dr. Kloss emphasised some of the leading differences between slow-speed and high-speed alternators in regard to the necessity for artificial ventilation, the fact that such close inherent voltage regulation was not attainable with turbo-alternators as with slow-speed machines, and the influence of the amount of margin allowed in the specification of the rated load factor on the price of the machine.

With reference to Mr. A. H. Law's remarks on the ventilating arrangement of the 6,000-kw. Siemens turbo-alternator at Stuart Street, Manchester, the author points out that his assumption that the air after cooling the stator core and stator coils had to go through the rotor, and thus would be already warm when it had to cool the rotor, is not correct. The ventilation of this machine is so arranged that the cool air, entering the machine from the bottom, is divided into two streams—one going through the stator core from both ends to the middle, whilst the other stream of air enters the rotor and leaves it without interfering with the stator stream, which it only joins near to the outlet of the machine. A special feature of this machine is the axial cooling of the stator through holes punched in the core plates, by which means it is possible to take the heat produced in the core to the cooling medium in the direction of the laminæ, where, of course, the heat conductivity is much greater than in the direction across the laminæ, where it has to travel through the paper insulation. The author agrees with Mr. Law that the V-shaped space between the poles is not simply wasted, but has the result that the number of ampere-turns per cm. circumference need not be reduced to such a large extent as would otherwise be the case, simply on account of the reduced winding space; further, that for small machines, a forced ventilation scheme with an outside fan would not be advisable.

As regards the voltage drop, the author remarks that the saturation factor has really only a very small influence, the governing factor being the ratio $\frac{I_n}{I_k}$. This is one reason why it is inadvisable to go too far in reducing the short-circuit current of turbo-alternators, even in view of the fact that the various methods of compounding or of automatically regulating give us the possibility of working machines safely with reduced short-circuit current. A ratio of short-circuit current of 1·6 times normal current would seem to be a fair figure for turbo-alternators. The author agrees with Dr. Rosenberg that a cylindrical rotor has less leakage than a salient pole type rotor, and that from this reason the voltage regulation of a machine of the former type will be better. With regard to enclosed self-ventilating machines, the author points out that if a fan is fixed to the rotor, the diameter and the speed are fixed, and therefore there is no great possibility of variation in the design, and it is only natural that such a fan cannot be expected to be very economical. However, in the case of the separate external fan, we are quite at liberty to choose the diameter and the speed, so as to obtain the most economical design with the highest possible efficiency. It is thus quite possible that an external outside fan will provide the necessary amount of cooling air with about half the power which would be absorbed by internal fans. In answer to Mr. Watson's question about the separate losses of the 6,000-kw. alternator mentioned in the Paper, Dr. Kloss gives the following values:—Iron loss, 135 kw.; copper losses in stator and rotor, 50 kw.; bearing friction and windage, 65 kw. The fan requires about 16 kw. for supplying the necessary cooling air to the machine.

The author concludes with the following remarks with regard to the heat limit of the rotor:—Some of the speakers disagreed with my statement that the output of turbo-alternators was not so much limited by the stator but by the rotor. Of course, I did not mean to say that it was impossible to provide a good ventilation for the rotor. But I think when, with certain dimensions, the stator of a turbo comes up against the heat limit whilst the rotor is still below this limit, it will certainly be possible to increase the *outside* diameter of the stator to allow for a bigger flux to pass through, and by such means increase the output until the increased excitation loss brings us up to the heat limit of the rotor. When, however, this is reached, no further increase is possible, because all the available space in the rotor has already been taken up. I must therefore still maintain that the output of a turbo-alternator is at the end limited by the rotor and not by the stator.

Royal Society of Arts.—The following Cantor Lectures have been arranged:—"Electric Power Supply," by G. L. Addenbrooke, January 18th, 25th, and February 1st; "Methods of Artificial Illumination," by Mr. Leon Gaster, February 15th and 22nd, and March 1st and 8th; "Steam Turbines," by Mr. G. G. Stoney, March 22nd and 29th, and April 5th.

NEW TURBO-GENERATORS FOR THE L.C.C. TRAMWAYS

THE Highways Committee of the London County Council has reported upon the tenders for the supply, delivery, and erection of two 5,000-kilowatt steam turbo-generators for the second portion of the Greenwich generating station. The list of tenders received is given below:—

Belliss & Morcom, Ltd., Birmingham (Westinghouse generator)	£37,350 0 0
Bellis & Morcom, Ltd., Birmingham (Electric Construction Co.'s generator) (*Alternative tender*)	37,644 0 0
Electric Construction Co., Ltd., Wolverhampton (Belliss turbine)	37,858 0 0
British Westinghouse Electric and Manufacturing Co., Ltd., Manchester (Rateau turbine)	40,800 0 0
Belliss & Morcom, Ltd., Birmingham (General Electric Co.'s generator) (*Second alternative tender*)	41,821 0 0
General Electric Co., Ltd., Birmingham (Belliss turbine)	42,249 6 0
Willans & Robinson, Ltd., Rugby (Dick, Kerr generator)	43,174 0 0
Electric Construction Co., Ltd., Wolverhampton (Parsons turbine) (*Alternative tender*)	43,736 0 0
C. A. Parsons & Co., Newcastle-on-Tyne (Parsons generator)	44,055 0 0
British Thomson-Houston Co., Ltd., Rugby (British Thomson-Houston generator) ...	44,620 0 0
C. A. Parsons & Co., Newcastle-on-Tyne (Westinghouse generator) (*Alternative tender*)	44,688 0 0
James Howden & Co., Ltd., Glasgow (Westinghouse generator)	48,495 0 0
General Electric Co., Ltd., Birmingham (Parsons turbine) (*Alternative tender*)	49,137 3 6
Electric Construction Co., Ltd., Wolverhampton (Musgrave turbine) (*Second alternative tender*)	50,328 0 0
John Musgrave & Sons, Ltd., Bolton (Westinghouse generator)	50,890 0 0
John Musgrave & Sons, Ltd., Bolton ((Electric Construction Co.'s generator) (*Alternative tender*)	51,237 0 0
The Electrical Co., Ltd., Charing Cross Road, W.C. (A. E. G. generator)	57,700 0 0

The estimate of the chief officer of tramways comparable with the above tenders is £50,000.

In reporting upon these, the Highways Committee state that the Chief Officer of Tramways, with the Tramways Electrical Engineer, has personally inspected the works of several of the firms submitting tenders, and he has also inspected turbines made by the firms in question. As regards the two lowest tenders of Belliss & Morcom, Ltd., the turbo-generators manufactured by this firm and in operation are not of a size commensurate with those required at the generating station, and although it is recognised that the firm has a high reputation for reciprocating engines, the Committee feel it essential that the contractors for the work should have had experience in the manufacture of turbines comparable with those to be installed at the generating station. The first three tenders include Belliss & Morcom turbines, while the fourth, namely, that of the British Westinghouse Electric & Manufacturing Company, Ltd., includes turbines of the "Rateau" type. There are no examples of a large type of these last-mentioned machines in operation in this country, and accordingly the Chief Officer of Tramways and the Tramways Electrical Engineer visited works in Milan, where "Rateau" turbines are in use. Having considered a report by the Chief Officer of Tramways, the Committee have decided that it would be in the best interests of the Council that it should accept the tender of the British Westinghouse Electric & Manufacturing Co., Ltd., above referred to, amounting to £40,800. This tender, it will be seen, is £3,450 higher than the lowest tender, that of Belliss & Morcom, Ltd., but the Committee feel justified in recommending the adoption of this course as the result of the very full investigations which have been conducted in the matter. It is also pointed out that the British Westinghouse Electric & Manufacturing Co., Ltd., has had very considerable experience in the construction and operation of large turbines, and if they will supply turbines of the "Rateau" principle, containing the main features and latest developments which the Council's officers have inspected, and in other respects conforming with the details of the specification and subject to the approval of the fully-detailed drawings when prepared, their tender should be accepted.

THE TRAINING OF TRAMCAR DRIVERS

THE report of the Special Committee appointed by the Tramways and Light Railways Association to consider the question of tramway brakes was published at the beginning of the present month, and an abstract of the report, together with the general conclusions of the Committee, was given on page 647 of our issue of November 12th. Among the causes of accidents were mentioned the insufficient training and the physical unfitness of motormen. The following is an abstract of the portion of the report relating to these:—

Of the 15 serious accidents reported upon by the Board of Trade, blame is directly imputed in nine cases to the driver of the car, and in the remaining six accidents a better knowledge on the part of the driver might have averted the accident. No amount of training will prevent accidents which are caused by carelessness, but many of the accidents which have occurred have been due to want of training in the motormen. While some undertakings give very considerable attention to the training of their motormen, with others the training provided is quite inadequate. On careful consideration of this matter, the Committee feels that it is not possible now to lay down the exact training necessary for motormen under all conditions, but gives the following as being the minimum course through which a man should go before driving a service car.

(1) After a man has been accepted as suitable in build, general appearance, and character, he should be certified by a doctor as being of sound physique generally, more especially as regards his limbs, heart, sight, and hearing.

(2) The man should be put in the shop or shed to get a general insight into the parts of the equipment.

(3) The learner must be provided with a book of regulations and instructions, and before he goes on a car he should be examined generally on the working of the car and its equipment, and on the book of regulations and instructions.

(4) When the learner is ready to practise driving, he should be taken on a special car, or placed with an experienced driver on a service car. It is most desirable, however, that the learner should practise with a dummy controller before going on a car.

(5) For the first day or so on the platform, the learner should only watch, and afterwards he should drive on the easy roads.

(6) When the learner is capable of driving, he should be re-examined as in (3).

(7) Lastly, the learner should be taken out on a practice car by the manager, instructor, or inspector, and tried on the worst parts of the route, difficulties being intentionally made to try the man's capabilities.

(8) When a learner starts as driver, he should be piloted for a few journeys by an inspector or skilled driver.

The above course should occupy not less than three weeks. A driver should not be placed on hilly routes until he has shown himself a reliable driver for at least twelve months.

Facilities should be given for conductors to qualify as drivers. In all cases, drivers should be re-examined annually as regards training, and medically every five years. The school of the London County Council is, perhaps, the most up-to-date of those already established. The following is the course of instruction carried out :—

Motormen are recruited from all classes of labour, though men are preferred who have had some experience as drivers of other vehicles. Before a man is placed in charge of an electric tramcar, he is trained not only in the starting and stopping of the car, but also in a knowledge of the working of the full electrical equipment. This is done by a series of lectures and demonstrations on a dummy car, in which all working parts are fully exposed. Between the lectures, the men go out on the practice car for driving without passengers, and are shown any special points in the track, insulated sections, and Board of Trade stops. After showing proficiency, the learners go out with an experienced driver to gain confidence in running the car to time, and learn the different routes. Before being passed out as an efficient driver, the learner is examined in driving and knowledge of the car, and what to do in case of emergency and breakdowns. A re-examination takes place again when an increase of pay is due, and the increase is only given to those who pass.

Finally the Committee state that they are desirous of emphasising the fact that, even if the best brakes are fitted, and the best training given to the drivers, the greatest security is not obtained unless good discipline is maintained, and care taken to see that the rules laid down for working the line are carefully adhered to. Driving at excessive speeds, inattention to stop notices, and the like, should be severely dealt with.

THE INSTITUTE OF METALS

THE first general meeting of this new institution was held in Birmingham on November 11th and 12th, when Sir William White delivered his Presidential Address, and several Papers were read and discussed.

The subject of the Presidential Address was the origin and objects of the institution. For some time past, said the President, there has been a widespread feeling that there was a need for a specialised society which should deal with the metallurgy and manufacture of non-ferrous metals and their alloys, on lines parallel to those which have yielded remarkable results in regard to iron and its alloys since the Iron and Steel Institute was founded in 1869. The researches carried out at the National Physical Laboratory with the financial assistance of the Institution of Mechanical Engineers strengthened this feeling, and at a meeting of representatives from London, Birmingham, Sheffield, and Manchester, held in London last June, it was decided to found the present Institute. The objects of the Institute are to afford a means of communication between members of the non-ferrous metal trades and to advance generally the knowledge of metals and alloys.

The following are brief abstracts of some of the Papers which were read at the meeting.

Copper and Copper Alloys.—The author of this Paper, Mr. J. T. Milton, dealt with copper and its alloys from the point of view of the marine engineer. The minimum amount of working either by hot or cold rolling and drawing which was necessary to convert unreliable copper castings into reliable plates, sheets, or tubes, was, he said, not yet known; and this, together with the differences in practice with regard to annealing, often led to unexpected results. He also considered the relative strengths and the tendency to corrode of various copper alloys, including brass and gun-metal.

Aluminium.—In a Paper entitled "Aluminium and some of its Uses," Mr. J. T. W. Echevarri, after referring to the physical, mechanical, and chemical properties of the metal, described the methods of casting, rolling, and drawing most suitable for aluminium, and then dealt with a few of its applications. Its uses in iron and steel works for reducing the iron oxides and for preventing porosity, as well as the various applications of the heat liberated by the reaction between iron oxide and aluminium, were described, and the various alloys of aluminium and copper, zinc, or nickel were mentioned. With regard to the use of aluminium in the electrical industry, the author stated that, at the present prices of aluminium and copper, the saving in cost of the bare conductor is so large that there is an extensive field for the former metal for insulated underground cables, even taking into account the increased amount of insulation necessary. The usual method of jointing bare stranded cables is to weld the two ends together by pouring molten aluminium into a cigar-shaped mould, but for insulated cables the simplest method is to slip a tube over the two ends of the cable, with a slot through which the solder can be run.

Manufacture of Tubes.—Various processes, and some of the machines used in the manufacture of solid drawn tubes, were described in a Paper by W. H. A. Robertson. Among the electrolytic processes referred to was the Elmore process, in which a revolving mandril is surrounded by unrefined Chili bars in a depositing tank of copper sulphate; the copper is deposited in the form of a tube of pure copper on the mandril. In this process it is necessary to burnish the deposited surface continuously. The centrifugal process due to Mr. Cowper Coles, and fully described on page 255 of ELECTRICAL ENGINEERING for August 13th, 1908, was also mentioned.

A Paper by Mr. C. H. Desch dealt with the formation of intermetallic compounds and their formulæ, and Mr. W. Rosenhain, of the National Physical Laboratory, read a Paper on the metallographic investigation of alloys. A Paper by Mr. C. D. Bengough and Dr. G. F. Hudson related to the mechanism of annealing in the case of certain copper alloys, and some notes on phosphor bronze were contributed by Mr. A. Philip. The last-mentioned Paper included the results of a large number of mechanical and chemical tests on phosphor bronze of different compositions.

The Electrobus in London.—We understand that the London, Brighton & South Coast Railway, in combination with the South-Eastern and Chatham Railway, have sanctioned the introduction of the electrobuses into the forecourt of Victoria Station, a privilege denied to all other motor omnibuses

New Cables for Special Purposes.—Among the exhibits of the Liverpool Electric Cable Co. at the Manchester Electrical Exhibition was a special "hard cord" braided cable. Specimens were shown of a twin vulcanised rubber cable, covered with a thin braided whip-cord, which is impregnated with ozokerit. The surface presents a rough appearance, but looks exceedingly strong, and the cable is particularly recommended by the firm for use as a trailing cable in shipyards, mines, and other places where rough usage is anticipated. Another use for this "hard cord" cable is as stage cable in theatres, and we understand that a considerable quantity of it has been supplied to Drury Lane Theatre. Another strong trailing cable shown was a concentric cable with an outer conductor consisting of a braid of copper wire covered with a similar braid of thin steel wire. A useful "hospital" cable was exhibited, in which the conductors are covered with a close outer tube of soft vulcanised rubber, so that the wire may be thoroughly cleaned, and, if necessary, washed down with dilute carbolic. Specimens of flexibles for motor-car ignition were also exhibited; these have a heavy insulation in black vulcanised rubber, and are supplied in two thicknesses, one for high-tension and one for low-tension igniters.

Workmen's Compensation.—The case of Lewery v. The British Westinghouse Electric & Manufacturing Co. came before Judge Scully in the Brighton County Court on Friday. The plaintiff, a labourer in the employ of the Westinghouse Co., was helping to move a dynamo, weighing 20 tons, into the Corporation's electricity works at Brighton on October 18th, 1907, when a balk of timber 5 ft. long fell upon his head from a distance of 20 ft. Since then he had been an out-patient at the Sussex County Hospital. It had been agreed to estimate his wages at 26s. per week in order to arrive at the amount, namely, 13s. per week, which should be paid him by the company. These payments have been continued until September 11th this year, when they ceased. The point to be decided was whether the plaintiff was still incapacitated. It was stated that he had tried to get various jobs but failed owing to his incapacity to do the work offered him. Medical evidence was called as to the fitness of the plaintiff, but the Judge came to the conclusion that he was still partially disabled and made an order for the payment by the company of 11s. per week.
